We now pass on to a few practical hints on the maintenance of the Baudot governor. The guiding rods should be perfectly parallel and the *masse* or weight M (Fig. XXI, No. 60, Vol. VI) should easily slide up and down them. To prove this release the weight by unhooking the springs from the adjusting bar, then hold the governor tilted at an angle of 45°, first in one direction then in a reverse one. The weight should glide easily up and down. If not, either the rods have become bent and will probably need workshop attention or they may need cleaning and oiling. The latter may be done by means of a clean oily rag or cotton waste. Should the movement of the weight along them still prove sluggish the application of emery paper may be advisable. In this case nothing coarser than grade 000 should be used, and the friction should be applied gently and *longitudinally, not in a circular direction.* In no case should dirt be permitted to accumulate between the weight and the fork, as this gives a tendency in the direction of stickiness which may produce a certain reluctance on the part of the weight to move outwards. When replacing the springs upon the adjusting-bar be careful that both drop into their slots and not on the edge of the hooks. Grit or accumulated dust in the holes where the springs pass through the weight will sometimes prevent the ready functioning of the springs. The normal running amplitude should not exceed more than half of the extreme possible, *i.e.*, half the diameter of the guard-ring.

Digitized by Google

The grinding rods should pass easily into the holes provided for them in the weight and *should occupy the centre of the holes* not take up a position as in M (Fig. LXXIV) a^1 with a tendency to

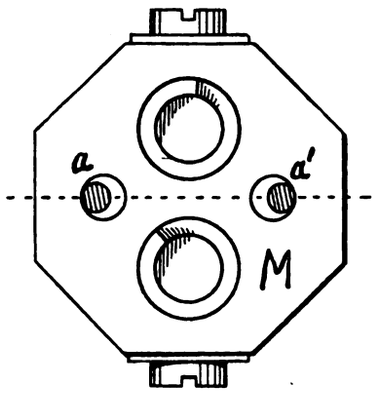

FIG. LXXIV.

press against the outer edge as there shown, or in the reverse direction towards the inner sides. To remedy this, very carefully adjust them in their position in the fork itself. This fault may present itself although the guiding rods have every appearance of being parallel.

Verify the position of the adjusting-bar occasionally. The springs may become *tired*. Or, the governor axle may, after a considerable time, show signs of undue play in its bearing B Fig. LXXV). These conditions will produce a decrease of speed

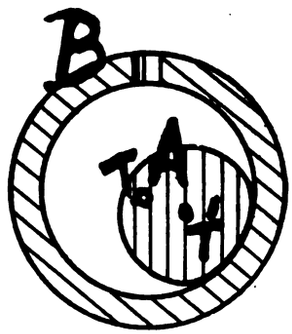

FIG. LXXV.

with a decrease of amplitude, *i.e.*, the tension zero of the springs will find itself at T^1, the centre of the axle A while the centre of rotation will be found at, say, T. The tension in this case will need to be delicately increased. It should be remembered that when in rotation, the chief wear and tear of the axle is always along one line of the circumference, and this wear is dependent upon the pressure of the revolving weight or *masse* which, thrown out by the centrifugal force developed, increases the pressure of A at the outer edge of the bearing B. The construction of the axle itself which is fitted with a limiting collar screwed on to the axle just behind the governor ensures that the friction produced by the axle shall always be at practically the same point.

(To be continued.)

HEARD DURING A VISIT TO A SUB-OFFICE.

"Can I have a dog licence, Miss?"

"Yes, what name?"

"Spot!"

TELEGRAPHIC MEMORABILIA.

As one grows older one hesitates to make new promises for a new year, realising too well the frailty of human nature and especially one's *own* human nature. Yet each opening year somehow presents itself as a clean sheet before us and there are few who do not dream or hope for higher heights, greater possibilities, more complete successes. We of the telegraphs, therefore, offer no apology for giving way to a dreaming of dreams and a seeing of visions regarding our own particular corner of State Service. Shall we see the steady rise of the traffic curve? May we hope for extended public services? Will 1922 see London in direct cable communication with Warsaw in a less intermittent sense than she is at present in wireless communication with Posen? How far will scientific research, discovery, and invention take us along the road to more stable telegraphic communication, both by cable and by wireless with the political and cathedral cities of Germany? Will a wir*eless* telegraphic system between our metropolis and Rome, for example, become sufficiently stable to help the lame and sadly-inefficient Anglo-Italian wires in their daily task of Sisyphus of rolling the traffic stone to a destination which is never reached? Or will the close of 1922 find this particular service still engaged in its hopeless task? One's hope is fixed upon the Italian Minister's plans of improved lines and an extension of the underground system and one hopes that one is not hoping in vain. That 1922 will see many renewed attempts on the part of private enterprise, by means of wireless, to compete with State-owned and cable systems may be anticipated with no small degree of certainty for there are many signs both at home and abroad that an immense amount of private capital is being sunk in *Sans Fil*.

Shall we see before the changing of many more moons some signs of a revival of Anglo-Russian telegrams? Again one has something more than fond hopes. As to the internal communications of our own land the vision is clearer and more well-defined. By the end of the present year both the telegraph and telephone systems of the United Kingdom will surely have reached a standard of stability never yet attained. Multiplex type-printing telegraphs will make further strides, while type-writer perforating keyboards will doubtless be further standardised, adapted to the various systems, and extended in their use upon both inland and foreign circuits. So much for the writer's reading of the telegraph horoscope!

It may be the Christmas season which is hovering round us while we go to press, but a meticulous correspondent writes as follows:—

> "The *Post Office Guide*, referring to *Inland* telegrams, says:—'A receipt for the *charges* prepaid upon a telegram can be obtained for one penny.' Is not this illegal for sums over £2?"
>
> "Referring to *Foreign* and *Colonial* Telegrams the same authority states: 'A receipt for a *telegram* can be obtained for one penny.'
>
> "The actual printed receipt, however, declares that the receipt is for a telegram on which certain charges have been paid. Where are we?"

The same correspondent, still in the conundrum spirit of Noel, continues:

> "Could an individual telegraphist be successfully prosecuted for loss or damage sustained through telegraphic error resulting from: (1) proved negligence; (2) causes over which the operator had no control, seeing that the titular head of the Post Office is himself immune?"

There is at least one European country where the telegraphist may be sued under heading number one.

Still in the ghostly spirit of the Yuletide season and with due acknowledgments to our scientific contemporary, the *Electrical Review*, the following letter from a Norwich correspondent is boldly *lifted*, title and all for the special benefit of the student readers of the T. AND T. JOURNAL!

Telephony—or Telepathy.

> "I wonder if you or any of your readers can explain the following occurrence:—A lady staying at a country house, wishing to use the telephone, took off the receiver and distinctly heard a conversation between her host and his agent; thinking that they were using other 'phones on the same line, she put back the receiver and waited till later for her call. Afterwards it transpired that her host and his agent had not been on the 'phone at all, but had held their conversation out in the park, somewhere near the telephone wires.
>
> I should like to know the explanation of this; it beats me altogether."

The very thoughtful and thought-provoking paper of Mr. Winyard on the "Possibilities of Post Office Developments," read before the T. and T. Society of London, towards the end of November last, was worthy of a much larger audience than that which the lecturer had to face. What the former lacked in numbers was, however, compensated for in the quality and rank of the listeners and debaters. The weather doubtless prevented many of those attending who lived at considerable distances from the centre of London. The catholic spirit of the Society in opening its platform to so many phases of thought regarding Post Office activities, was ably supported by the several speakers, while the Chairman, Mr. F. J. Brown, C.B.E., with his usual grace and courtesy, paid tribute to the ability of the U.P.W. officer who perhaps for the first time before a Post Office audience, so mixed in rank, had been able to show something of the constructive side of U.P.W. aims and ideals.

Digitized by Google

Signalling by invisible rays has been mentioned in these columns on more than one previous occasion, but some interesting facts were revealed by Dr. Houston just before the closing of the 1920-21 Session of the Glasgow Radio Club. Speaking more especially on optical signalling he referred to the many methods of secret visual signalling tried and practised during the war by means of colour filters infra-red and ultra-violet rays, polarised light, &c. Standing as we do in a century with invention crowding in upon invention, science bifurcating into researches which lead along strange paths and reveal new wonders on every hand, with the strangest and newest paths themselves again forking off and plunging into a maze of still newer discoveries, who shall say which is the more wonderful, the huge pressures measured in thousands of volts with their consequent immense waves surging through the infinite ether bearing the trembling human messages through space, or the tiny light from a 1½-volt bulb, as used by Dr. Houston, together with an ordinary telescope, screening off the visible rays and projecting only the *in*visible across the black waters of our darkened estuaries during war-time, yet the invisible again becoming visible when dealt with by the magician who alone held the more than alchemist powers. Truly, we are in the very realms of a fairyland undreamt of by Anderson or Grimms.

One would hardly go to so practical a source of information for confirmation of our world of fairyland as *The Times Trade Supplement*, but does not the following extract from that staid and reliable source give solid proof of the statement ?

> "A wireless development of interest to seafarers has resulted from the demand for a means of controlling fog signals off the coast and at the mouths of estuaries. This afforded a somewhat unusual problem, since to be of use the receiving apparatus must be capable of functioning without any adjustment or attention for long periods. Also it must operate without fail when required, and must not be liable to accidental operation by wireless signals other than those to which it is designed to respond. The practical solution has been provided by a combination of an improved form of the otherwise obsolete coherer acting in conjunction with a tuned mechanically oscillating relay. A wireless transmitter, suitably situated on shore, is caused to send out a series of "dots" by means of a controlling pendulum to which the receiver relay is tuned. The dot signals are received upon a small aerial on the fog gun or beacon, and each dot acting on the coherer causes a local current to apply an impulse to the tuned relay and, at the same time, to operate a tapper which provides the necessary decohering action. The relay is thus caused to swing through an arc which increases with each impulse until the relay contacts meet and the gas valve or other mechanism is operated. Apparatus of this description is to be found in the Clyde, where the fog guns at Fort Matilda and Roseneath Patch are operated from Gourock Pier. It is understood that the system is entirely satisfactory and has demonstrated its immunity from interference under exceptionally adverse conditions."

Electricity gives it that the only existing regular wireless *telephone* service at present existing in this country is that between the Mersey Docks and Harbour Board offices and the Bar Lightship, situated about a dozen miles out in the Irish Channel.

A paper on "Low Voltage Overhead Distribution" was read and discussed at the last Engineering Conference of the Institute of Civil Engineers. There was a distinct tendency to point to certain conditions which were considered somewhat onerous as laid down by the Electricity Commissioners and the G.P.O. These conditions, be it understood, were laid down solely for the protection of the public and its property, and although in these difficult times the need for retrenchment is fully recognised wherever possible, such economy cannot be true economy should it result in minimising the security of human life and jeopardising public utilities. The conclusions to which the writer of the paper had apparently arrived, are summed up by our contemporary as follows :—

> "The standard of work and appearance as well as of continuity of (electrical) supply, are much higher here than in many other countries, and the author believes that ultimately the distribution in all our towns, garden cities, and large villages will be done by underground cables. *The basis for this belief partly lies in the growing practice of the G.P.O. in replacing overhead wires by cables even in country villages.*"

According to the report of the Eastern Telegraph Company, one of the outstanding features of the 1920 accounts was the expenditure of £1,476,088 on new cables, and an increase of £365,917 for salaries and wages bringing the latter up to no less a sum than £1,082,068. The cable ships fund was credited with £100,000, and after the payment of all dividends £316,479 was carried forward, a reduction under this heading in round figures of one hundred thousand pounds as against 1919.

Unfortunately Mr. George Connell's health did not permit of a visit to the C.T.O. or other *rendezvous* in order that a public presentation could be made to him of the souvenirs purchased by his many friends in G.P.O. West. It is a far cry from London to Cornwall. The gifts consisted of a most musically-chiming 8-day clock and a tasteful breakfast cruet, the special selection of the mechanics.

The introduction of automatic re-transmitters (French pattern) into the forked Baudot systems as used by the British Administration marks an economic development, the success of which should already be assured. The trial is at present being made on a Birmingham-London-Portsmouth combination, six-triple duplex. The Liverpool-London-Paris-Lyons (triple duplex L.V.-T.S.F.-Paris) arrangement still continues to give satisfaction though hampered at times by the unstable line conditions abroad. In this case the London re-transmission is arranged by means of P.O. standard relays.

According to the *Tidens Tegn* it is proposed to lay two new telephone cables between Norway, Denmark and Germany. No. 1 cable would be laid between Arendal and Hirtshals or Fredriksvaern and Hirtshals. In either case the distance would be well under one hundred sea miles. The communication would, it is stated, give three telephonic and one telegraph connexion. The cable between Arendal and Germany would also give the same number of telephonic and telegraphic circuits. It is further stated that these proposals have already been submitted to the Norwegian Board of Telegraphs, and it is calculated that owing to modern developments the German cable will permit of telephonic communication between Scandinavia and Holland, Belgium, France, Switzerland, Italy and possibly beyond. Yet another proposal, not yet submitted however, is the laying of a 500-kilometre telephone cable between Stavanger and some point in the British Isles.

The *Daily Telegraph* is responsible for the statement that "the Commonwealth Government of Australia is likely to assent to the principle of duplication of the Pacific cable." It is understood that the decision had been postponed owing to prolonged consideration of wireless schemes. The proposal, it would appear, is for a modification of the existing route for the direct line *via* Auckland and Suva instead of Norfolk Island and, also *via* Fanning Island and Honolulu, instead of Bamfield. From Honolulu the present cable would be used to San Francisco and then would be utilised for American traffic only, while the Canadian route would be devoted to traffic for the British Isles and Europe.

In addition to a submarine telegraph cable with Argentina and Brazil the Italian Government, in granting a concession to a national company for this purpose, have apparently also included direct submarine cable communication between Italy and Spain and Italy and Greece. The Government has agreed to subsidise the Company for ten years contingent upon a fixed minimum of words being carried by each cable. The name of the corporation is understood to be the *Compagnia Italiana dei Cavi Telegrafici Sottomarini*. The radio service at Vinga (Sweden) is now giving bearings to ships on demand to facilitate entrance into Gothenburg harbour and the rounding of Skagen point.

The month of November saw the statement in the daily press that the Australian House of Representatives at Melbourne had laid on the table the draft agreement with the Amalgamated Wireless Company for a direct wireless service between this country and the Antipodes. The charges have been fixed, according to the London *Times*, and all that remains is the Parliamentary approval of the document. Following on these announcements wireless test messages were sent direct to Australia from Carnarvon, the correct reception of the same being acknowledged by cable both from Sydney and Melbourne. An interesting photograph of the battery of 56 valves used with this last experiment appeared in last month's issue of the *Wireless World*.

It is equally interesting to be able to state that the British Government news telegrams from their station at Leafield have been repeatedly received at Perth, Western Australia, though the wave-length used is quite a modest one. At times these "broadcast" telegrams contain from 400 to 500 words. It is not, however, claimed by Leafield that, "the message took one-sixteenth of a second in transit" as has been stated by the chaperons of another press telegram transmitted by another wireless system.

Meanwhile there appear to be two rival wireless private systems having schemes before the Australian Government for the exploitation of a British-Australian Service. The Federal Parliament, according to *The Times*, has referred the matter to a joint committee.

The *Electrical Review* of Dec. 9 states that: "The Director of the Telegraphic Services at Amsterdam announces that direct telegraphic communication has been established between the C.T.O., London, and Amsterdam. It is permissible to correct our contemporary. Direct telegraphic communication between Amsterdam and London has been established to the writer's knowledge for at least 40 years ! The communication referred to by Amsterdam is probably the recently inaugurated extension of telegraphic facilities between Amsterdam Bourse and London Stock Exchange, direct telegraphic communication being thus established between the two Stock Exchanges during "Stock" hours. The Paris Bourse and the London Stock have similarly been connected for many months past. Structural restrictions in the London building for the present prevent any extension of these much-appreciated facilities.

The Annual Report of the Pacific Cable Board for the year ended March 1921 is interesting reading. Naturally the world slump had its effects upon the Board's finance, nevertheless the gross receipts amounted to £633,343. The Sydney-Auckland cable was out of commission for one day and the Bamfield-Victoria cable from Nov. 27, 1920, to Dec. 19, 1921. Alternative routes were however available. The land lines in Canada, leased from the Canadian Pacific Railway worked well, and leases of the lines between Montreal and Bamfield and between Vancouver City and Victoria have been renewed for a period of ten years on favourable terms. The Board's cable repairing steamer, the *Iris*, has been occupied on Admiralty contracts during the past year.

Digitized by Google

From the *Electrical Review*, Dec. 2, 1921. "The Eastern Extension results are handicapped by the taxes of £666,000, being £250,000 larger than those for the previous year. The depreciation-of-investments account gets nothing this year, as against £200,000 a year ago, and the company carries forward the small amount of £80,000. The results are good enough, considering the times through which industry is passing, and submarine cable stocks are amongst the very few which have shown hardly any depreciation during the trade slump throughout the world.

Marconis have gone back to 1¼, and the wireless group is very quiet."

The Shipbuilder gives a photograph and description of a new cable steamer which was christened the *All America*. She has been built for cable-repairing apparently being practically a *replica* of the cable steamer *Guardian*. Her overall length is 295 feet, and her breadth 37 feet. The total coiling capacity of her cable tanks is about 14,000 cubic feet. The cable machinery was supplied by the Telegraph Construction and Maintenance Co. She carries three bow sheaves forward and one aft and is fitted with oil fuel bunkers of large capacity to enable her to keep at sea for long periods. The vessel was built and engined at the Neptune Works of Messrs. Swan for the All America Cables Incorporated Co.

The launching of this vessel may have some connexion with the statement made by the *Costa Rica Official Gazette* to the effect that a contract was signed on Oct. 9 between the Government of Costa Rica and the All America Company for the establishment within 18 months of a direct cable service between Costa Rica and foreign countries. Port Limon will be connected by cable with the Isthmus of Panama and this with the All America Cables Incorporated Company's network, late The Central & South American Telegraph Company.

Mr. B. J. B. Salmon of the Cable Room has been promoted to the class of Overseers in place of Mr. Gaisford, retired owing to ill-health. All colleagues of both of these officers while congratulating the former, express the sincerest regret at the physical causes which have operated in curtailing the service years of the latter.

Quite as an experiment readers will find that the writer, tired of his own scribbling, is introducing every month and as a termination to these particular columns, at least one quotation from a literary, scientific, or philosophical source. Thus, A. C. Benson in *From a College Window*: -"I have always believed that it is better to stimulate than to correct, to fortify rather than to blame. If there is one attitude that I fear and hate more than another, it is the attitude of the cynic. I believe with all my soul in romance, that is in a certain high-hearted, eager dealing with life, . . . I have grown to believe that the one thing worth aiming at is simplicity of heart and life; that one's relations with others should be direct and not diplomatic; that power leaves a bitter taste in the mouth: that meanness and hardness and coldness are the unforgivable sins."

J. J. T.

LONDON ENGINEERING DISTRICT NOTES.

FROM the staff of the London Engineering District to all co-workers-Greetings. May the year 1922 prove a happy and prosperous one to all engaged in the gentle arts of providing, maintaining and operating lines of communication.

Let the fact never be lost sight of that evil communications corrupt good manners.

Looking beneath the Surface.

In most operations there are some phases that are more spectacular than others and which appeal to the casual observer as the most important. Those who do the less conspicuous but nevertheless highly important work may not do it less efficiently because they are not constantly in the limelight, but they certainly will take greater interest and pride in their daily toil if they know that its importance is appreciated by those whose opinion they value. For this reason the jointers working in manholes in some busy city streets were gratified to receive a visit recently from Sir Evelyn Murray, and to note the keen interest that he took in the work they were doing. As pairs in cables which had been teed in readiness for a large exchange transfer were being cut away and joined through to other pairs our engineering readers will realise that the Secretary saw some typical examples of complicated operations that must perforce be carried out in confined spaces. It is unfortunate that it is not practicable for the Department to extend the scope of its invitation to the public and allow them to visit the jointers in their underground chambers and see how the lines from the subscribers' premises are carried through to the exchange.

If would-be subscribers realised what is involved in planning and providing the line plant in a city such as London, they might be more patient when told that the stage when any demand can be met practically at once has not yet been reached. It is not lack of will that prevents the immediate gratification of this desire. The good work is going on and the promised land is now in sight.

Telegraph Installations in Newspaper Offices.

All newspaper offices in London of any pretensions have their own telegraph circuits to the Central Telegraph Office. Until recently the current for working these was provided either from primary batteries on the premises or over individual power circuits from the C.T.O. power plant in G.P.O. West. The fact that the principal offices are located in or near Fleet Street has rendered it economically possible to lay a special ring main from the C.T.O. from which tees are taken into the offices *en route*. The main consists of a cable with 6, 7/16 cores, each insulated with vulcanised rubber. The voltages connected are 40, 80 and 120 positive and negative. At certain offices the cable is looped in and terminated in a convenient manner for testing. Considerable economies in maintenance are anticipated as in addition to a number of individual power leads, some 6,000 dry cells have been recovered.

Accidents.

The possibility of accidents to persons and plant is the cause of a great deal of worry to the Engineering staff, both to persons whose duty it is to carry out work in subscribers' premises and those employed in installing and maintaining the line plant, whether overhead or underground. A fitter has to be very careful to avoid puncturing gas or water mains when plugging walls; every fitter knows that his first task is to enquire whether there are likely to be any pipes hidden in the wall to which he is about to fix apparatus. Often wire has to be run in such positions that a tool dropped accidentally might do considerable damage. It is not always possible to get fixtures moved, and the risk of breakage must be taken; in such cases, the responsibility rests with the subscriber, if, after being warned, he fails to take the necessary precautions to safeguard his property. Effect does not always follow close on the heels of cause: recently a claim was made against the Department for damage to a wall mirror, some considerable time after the installation of a telephone on the premises. Investigation showed that the fitter had driven a screw through a partition and the back of the mirror just far enough for the point to touch the glass but not to break it; subsequent expansion of the screw, due to change of temperature, however, caused a fracture with the result that the Department was mulcted for damages.

External workmen have ample opportunities of causing damage but are more often the sufferers through the carelessness of others. Many drivers of vehicles seem to have a grievance against the Post Office and to vent it by upsetting, despite the red flag that decorates each end of them, those gothic structures, described by a London magistrate in a recent communication to the Post Office as "wigwams." It is curious what a penchant some pedestrians have for tripping over footway box covers, but, when one individual is found to have made no less than 3 claims in connexion with such accidents, the Department may be excused for suggesting that the supposed sufferer, like the man who married 3 times, had contracted a bad habit.

Occasionally accidents affecting life and limb occur, but, thanks to the extraordinary precautions taken by the Department, such are rare and are invariably due to neglect, on the part of the workman affected, to carry out some important instruction framed for his benefit.

Fire Alarms.

The ideal of the Fire Brigade Authorities is the annihilation of time between the notification of a fire and their arrival at the premises affected; hence the replacement of horse-driven vehicles by motor pumps and escapes. The last pair of horses has just been withdrawn from service. The Fire Brigades are chiefly dependent for the notification of fires upon the fire alarm systems which, in most cases, are installed and maintained by the Post Office Engineering Department. The importance of maintaining the lines and apparatus in efficient condition is fully realised by the Engineers responsible and special attention is given to this duty. Very close co-operation exists between the Brigade Authorities and Post Office staff, and there is reason to believe that the former have every confidence in the latter. A number of linemen are scheduled for duty in the event of faults showing up after the normal working hours so that at any time, day or night, prompt attention is guaranteed.

Possibility of Post Office Development.

During the discussion of Mr. Winyard's papers at the Telephone and Telegraph Society's Meeting on Nov. 21, some of the speakers suggested directions in which the Engineering Department might extend their activities.

One was that they should take over the supply of electricity throughout the Kingdom. If this service ever does become nationalised, it will be of sufficient magnitude to justify being dealt with by a separate department and not by the Post Office. It may be that the speaker had in mind the possibility of using the telephone wires for the additional duty of supplying current for lighting and power purposes to subscribers' premises. Perhaps a wireless system of supply might be more effective.

Another suggestion was that in cases where groups of houses are being built, the Post Office should put down plant in the newly-formed streets and wire every house for the telephone. Unfortunately, it has not yet been made an offence to be without a telephone, as it is to be without water. The person who made the suggestion may rest assured that the telephonic needs of these sites are not overlooked and that plant sufficient to meet the probable needs for many years to come is installed in the streets and that, in the interests of national economy, any underground plant required is placed in position before the roads are made up and not afterwards

New Type of Message Carrier.

At the new Golders Green B.O. a message carrier of a new type has just been installed by the Gipe Company. The special feature of interest in this carrier is that the small carriage holding the message form is propelled rapidly along the supporting wires by the sudden divergence of the pair of wires at the despatching end. A similar installation is working at another London office.

The
Telegraph and Telephone Journal.

PUBLISHED MONTHLY IN THE INTERESTS OF THE TELEGRAPH AND TELEPHONE SERVICE, UNDER THE PATRONAGE OF THE POSTMASTER-GENERAL.

Editing and Organising Committee - - - JOHN LEE. J. J. TYRRELL. W. A. VALENTINE. J. W. WISSENDEN.

Managing Editor - - W. H. GUNSTON.

NOTICES.

As the object of the JOURNAL *is the interchange of information on all subjects affecting the Telegraph and Telephone Service, the Managing Editor will be glad to consider contributions, and all communications together with photographs, diagrams, or other illustrations, should be addressed to him at G.P.O. North, London, E.C.*1. *The Managing Editor will not be responsible for any manuscripts which he finds himself unable to use, but he will take the utmost care to return such manuscripts as promptly as possible. Photographs illustrating accepted articles will be returned if desired.*

VOL. VIII. JANUARY, 1922. No. 82.

POST OFFICE DEVELOPMENT.

THE Post Office has been well-named the "handmaiden of commerce." Its functions are manifold and its activities extend to every corner of the country and affect every member of the public in greater or less degree. The future will, no doubt, see considerable development and extension of these functions and activities, widespread though they are at present, but it will tax the enthusiasm of the most confirmed advocate of Post Office development to give support to all the proposals made in the very interesting paper which Mr. A. C. Winyard read before the Telephone and Telegraph Society of London and which appears elsewhere in our columns. Mr. Winyard has all the courage and audacity of the ardent reformer. He sees nothing fearful in the Post Office, apart from its existing responsibilities, becoming a bank of such magnitude that every existing banking institution would be a pigmy in comparison, or in its developing of an insurance business which would out distance all competition, or in its taking charge of all foreign cables, or in its assuming house-to-house delivery of newspapers. These suggestions leave one breathless. Mr. Winyard conceives a Post Office grown to such dimensions as to be beyond the grasp of the ordinary mind and one can only pity the men whose unfortunate lot it would be to administer so gargantuan a business.

We will leave the proposals which concern matters other than the telegraph and telephone services to others better qualified to consider them. As regards telegraphs, apart from the question of operating all foreign cables, Mr. Winyard's suggestions come under three heads (1) whether there is a case for urgent and non-urgent telegrams with a differentiated tariff; (2) the introduction of deposit account telegrams, ; and (3) the anomaly of a Flat Rate Tariff.

The first and third suggestions are old friends. The traditional attitude of the British Post Office is that all telegrams are urgent, and facilities, both as regards plant and staff, have been provided to ensure rapidity of service. A marked differentiation between urgent and non-urgent telegrams in respect to quality of service, such as would justify a differentiated tariff, could be secured only by holding up non-urgent messages, as it is certain that members of the public would not be prepared to pay a higher tariff for urgent telegrams if their transmission were hastened only to the extent of a few minutes. In Continental countries the proportion of urgent telegrams amounts to only 3 or 4 per cent. of the whole. There is no reason to suppose that it would be appreciably higher in this country, and, unless the present tariff became the non-urgent rate and a higher rate were imposed for urgent telegrams, the proposal would result in a considerable loss of revenue which the telegraph service certainly cannot afford.

The Flat Rate system of charge may seem anomalous, but, with the transfer of the great bulk of short-distance communications to the telephone service, there are not such wide variations in the wire mileage of telegrams as one might suppose. The operating charges per telegram remain fairly constant whatever the mileage, and the charge for the use of plant, which is covered by the tariff, is comparatively small. The Flat Rate system of charge has become so integral a part of the British telegraph service that very strong reasons would be required for departing from it. Mr. Winyard does not furnish details of how the deposit account system, which he suggests, would work, but it would seem to involve a complicated method of accounting, and one may doubt whether much use would be made of such a system if it were introduced.

The Editing Committee take this opportunity of wishing all readers at home and abroad a Happy and Prosperous New Year.

Suggestions have been made by our readers from time to time that a column of "Answers to Correspondents" would be a desirable feature in the JOURNAL. The Editing Committee therefore invite enquiries on telegraphic, telephonic and kindred subjects which they will be glad to answer so far as lies in their power.

POSSIBILITIES OF POST OFFICE DEVELOPMENT.*

A. C. WINYARD (C.T.O.)

I WAS informed in the communications which passed respecting to-night's meeting that the subject was regarded in some quarters as of a controversial character, and confess I was somewhat surprised. I imagine, however, the controversial side of the subject is bound up with the question of the *advisability* of Post Office development rather than with its *possibility*. I suppose even in this year of grace, 1921, differences of opinion still exist as to the desirability of Post Office extension, either in competition with, or independent of, private enterprise, and there are possibly a number of individuals in all ranks of society who look upon new forms of State trading whether in the Post Office or elsewhere as inventions of the devil.

In this connexion we are irresistibly reminded of the dictum of a former Postmaster-General when he laid it down "that any scheme involving an extension of active competition on the part of the State with work already done cheaply and efficiently by private enterprise would have no chance of receiving the assent of Parliament." Possibly some of us would be inclined to agree if the reference was to the present House of Commons, but the Postmaster-General who gave utterance to such a declaration made it clear that it was his personal opinion only. Other times, other manners, and one has more than a suspicion that the past few months have brought a new orientation to St. Martins-Le-Grand.

The ink was scarcely dry on the portentous declaration of policy just mentioned, when the Post Office announced the initiation of that great scheme of Imperial communication, the State-owned cable across the Atlantic. That was an anti-climax indeed. A step which has been of inestimable benefit to this country and the Empire, not only during the war period but since the advent of peace. The opponents of State trading nowadays are not in a very happy position. In all phases of commercial life, and in all classes of society the principle of State or municipal enterprise is steadily gaining ground and obtaining recognition. It is sapping and mining in all directions under the trenches of private profit, and infiltration is proceeding at such a rate that it is only a question of time before a flood-tide sets in.

That well-known writer, Emil Davies, in his interesting work entitled "The Case for Nationalisation," doubtless familiar to many present, has so admirably illustrated the position that I make no apology for quoting his word-picture. He sums up as follows:—

> "Eliminating the element of time in getting from place to place it is already possible for a man in any civilized country to be brought into the world by a State doctor or mid-wife, reared in a State nursery, educated, clothed and doctored at a State school, and, if needs be, fed at the cost of the community during his school days. He can earn his living in Government employment in any country. In most big towns he can live in a municipally-owned house. In New Zealand the Government will lend him money with which to buy a house, and it will also lend him, free of charge, the plans on which to construct it. If sick, he may be treated by a State doctor, or in a State hospital. He may read at the State or municipal library until he goes blind, when the State will take him into a State blind asylum, or until he goes off his head, when he will be cared for in a State lunatic asylum. If unemployed, the State endeavours to find him work. In most of the towns in Italy or in Budapest, he can buy his bread from the municipal bakery, and in other countries he can get municipally-killed meat from a municipal butchery, and flavour it with Government salt after having cooked it over a fire made with State-mined coal. Or he can partake of this meal in a municipal restaurant, drinking municipal brewed beer, wine from the State vineyards or State spirits. He then lights his State-made cigar with State-made matches, and can read a municipally-produced daily newspaper. By this time, feeling more cheerful, he can draw some more money from his account at the State or municipal savings bank, and can visit the municipally-owned racecourse, where he gambles with the State or city, and can end up the evening at the State or municipally-owned theatre. If he likes he can even take a municipal ballet girl out to supper, after which he may, if he feels so inclined, confess to a State-supported priest. Then, if he can afford it he may go to recuperate at a State or municipal water spa, or bath in France, Germany or New Zealand, after having insured his life with a State Insurance office, and his house and furniture with the State fire department.
>
> By this time if a strong individualist, in despair at the encroachments of the State and municipality in every domain of life's activity, he can buy State gunpowder at a State shop and blow his brains out; or if he likes to blow out some one else's, the State, having brought him into the world and made him what he is, will finish the job and kill him, this being a monopoly jealously guarded by the State except in war time.
>
> In Switzerland, Paris or many another city, the municipality will bury him. There is no time on this occasion to follow him beyond this stage, except to mention that the Public Trustee in most countries will probably look after the deceased's affairs much better than he himself did during his lifetime.

It is difficult to resist the conclusion from such a summing-up, that however disastrous the Russian experiment may have been, as indeed all drastic and extremist steps are bound to be under such circumstances, by gradual processes, the doctrine and the practicability of State or municipal enterprise is fermenting the Western nations.

Suggestions for the extension and development of Post Office services are by no means novel.

They were first put forward several years before the war, by the various Post Office Trade Unions, and in that campaign, what was then known as the United Kingdom Postal Clerks Association, played a prominent part. A comprehensive booklet on the question was published by that organisation, which in the main covered the majority of the proposals since discussed in a wider sphere.

A number of deputations have visited the Postmaster-General, and articles have appeared in the Service journals dealing with various phases of the question; the most recent instance being the publication in the "Post Annual" of an interesting description of the Postal Cheque System. One cannot, therefore, in any shape or form claim originality for the proposals adumbrated, nor will it be possible to go fully into details. They are of such an extensive character and cover such a wide variety of subjects that to-night it would merely fog the issue, and one can only hope to present the skeleton or framework of the development theory.

The suggestions which have been advanced from time to time for Post Office development are based mainly on the broad ground that the Post Office with its extensive network of offices, stretching like tentacles throughout the whole of the United Kingdom, possess an unrivalled and unique organisation for enlargement and extension of services—an organisation the equal of which does not lie in the possession of any private company, however powerful and far-reaching it may be. The staff and machinery are there, and it should be a comparatively simple matter to superimpose upon that organisation, other services of a remunerative character, without unduly increasing the necessary standing charges. A close consideration irresistibly drives one to the conclusion, however, that future Post Office expansion is inevitably bound up with the question of international relationship, remote though the connexion might at first sight appear.

If this country in common with others, is to be engaged in another world war before many decades or even years are past, then future development must be viewed from an entirely different angle to what would be possible if a pathway to peace became visible. There are only two possible channels. One was being traversed when the flood-tide of August 1914 burst upon us. It is labelled "Militarism," and carries its attendant implications. If such be the chosen pathway of mankind in the time to come, then the British Post Office would have one, and only one duty before it—however much as individual members of that Service we might deplore the position—and that duty would be to develop still further, these war-time activities in which it excelled so greatly, in order to be adequately prepared against the future tide of war. All question of development tending towards the encouragement of peaceful industry in such circumstances would rightly be excluded.

I trust and believe, however, that the pathway of humanity is set in the other direction—the channel leading to disarmament, and the encouragement and development of the arts and industries of peace—then indeed, a new orientation will open—and the future development of Postal Services can, and must be, viewed from quite a different standpoint.

We are sometimes apt to forget that even in the past the Post Office has developed—and developed at an extraordinary pace—but even so, it has been a development arrived at by force of circumstances, rather than of will, and it has taken place in what can only be described as an atmosphere of doubt and distrust with the possibility of war always looming on the horizon. Remove that dread spectre, bring security to industry, and we shall see such a trade revival, such an increase of industrial and commercial prosperity, as the world has seldom witnessed. I am an optimist in this matter. I believe we are on the eve of a revival of this nature, and without indulging in metaphors concerning "rainbows" and "sunshine over the Welsh mountains," we can yet see a new era opening before stricken humanity. In the coming commercial expansion the Post Office will doubtless share, but it indicates that the problem must be faced from a fresh point of view, and with a recognition that in the new circumstances a far heavier responsibility than hitherto will rest upon the shoulders of Postal administrators. The Post Office has always been, in a limited and restricted sense, the hand-maiden of the people. In the industrial revival it should strive to attain that ideal in a very real and comprehensive sense; until it would really become in the best meaning of the term, the "People's Office."

Perhaps for a few moments I may be permitted to refer to the attitude, the traditional attitude, of the Treasury and the Department towards the question of development. One of the chief difficulties has been that of Treasury control, for it can be said with a good deal of confidence that scarcely any industry in the country would be able to register a success under the financial restrictions and supervision imposed by Whitehall.

The actual attitude of the Treasury towards extension, is perhaps not quite identical with that of the Government. The latter are influenced by factors which do not, except indirectly, touch the former. Politics being what it is—Big Business, Political Expediency, or any old thing which affects votes—those supremely important factors in a modern democracy—will

* Paper read before the Telephone and Telegraph Society of London.

Digitized by Google

always play some part in the attitude of a Government, and, we cannot reasonably expect it to be otherwise while the present system remains. The Treasury should certainly not be influenced by any of these considerations, and yet as far as the outsider can discern it views Post Office expenditure almost as though it was a non-revenue producing Department; and seems to ignore the fact, that the income is derived from transfer of goods and services, which, sold in the Post Office shop, are always good value for money

Whatever other changes are made in Treasury control, and such are quite possible—given altered methods of presenting accounts to Parliament- it is obvious that a complete differentiation should be drawn between the expenditure of a department like the Post Office, and that of departments which are administrative only. With control exercised as it has been in the past, it is a distinct tribute to Post Office management that it is such an outstanding example of successful enterprise; successful financially in peace, giving a service and supply unsurpassed in efficiency and quality and withstanding war shocks in a manner unrivalled by private firms. It has emerged from the struggle--a struggle which saw private industry rocking to its foundations --with its reserves almost untouched, its morale unimpaired, and ready to take its place in the coming commercial expansion with credit to the Empire -- if the Government and Treasury but permit.

What better instrument could we have than such a stable institution on which to build, broad as its own foundation, an organisation of public service, instinct with initiative and enterprise, and inspired by the glowing ideal "for the good of the public."

It has been the accepted theory in some circles, that the conservative attitude adopted by the Post Office has been to some extent dictated by fear of press criticism if it ventured at all into domains hitherto sacred to private enterprise. If the Department was ever under the impression that the adoption of a negative policy would save them from criticism in the press, surely recent events have undeceived them.

When one discovers that newspapers with views not usually favorable towards public enterprise, begin criticising the Post Office, not because of the establishment of a new Service, but because that service—the air mail to Paris –is in their opinion insufficiently advertised—then it is time to sit up and take notice.

A policy of audacity as the Prime Minister would say, always pays, even for the British Post Office when facing press criticism. Those who are most opposed to the development policy are moreover in no sort of doubt as to the attitude of the staff.

The Post Office Trade Unions have carried resolution after resolution at their annual conferences endorsing the policy, and this represents the considered attitude of the great majority. There is a desire, a very natural and proper one, amongst those likely to be affected by development proposals for due recognition to be accorded, of added responsibility which fresh service entails.

But a State service is not alone in that respect—employees of private firms take up inevitably a similar and in some cases a far more definite attitude. Fresh services hve been added in considerable variety during the war, and it would be quite easy to argue that in such circumstances, employees of private companies would have put forward much greater demands.

One has only to contrast Postal work, as it exists to-day, with the position as it was in the early days of its establishment, to realise the great changes which have taken place.

The Post Office commonced its work as a carrier for the common people but a haphazard selection of present day services is almost startling in its wide variety. Let me recapitulate a few at random. They comprise: Life Assurances, Annuities, Telegrams, Telephonic communication, Pensions, Savings bank, Cablegrams, Wireless, Air Mails, International Coupons, Railway letters, Postal Orders, Money Orders, Licences, Patent Forms, National Savings Certificates, Government Stock, Express service, etc.

Speaking generally existing Post Office services respond in a marked manner to the outside industrial atmosphere. The ebb and flow corresponds to the fluctuations in trade, for the Post Office is a very sensitive industrial barometer.

It may be said that the fluctuations are not quite so violent, nor are they so disastrous in effect, as are those in outside industry. This is due not only to the inherent stability of State trading, but to higher efficiency in comparison with the average business firm. Nevertheless, the condition of industry generally, reacts on the Postal Services inevitably, whether in a favourable or unfavourable direction.

The flow of telephonic traffic was reduced by war-time restrictions, such as the limitations on racing. The increased cost of paper during the war, automatically reduced posting, quite apart from the increased postage rates which were imposed, and so forth and so on, instances could be multiplied almost indefinitely. The real lesson to be learnt is, that even from self interest the utmost possible should be done by the Post Office to help and encourage trade, for it encourages thereby its own prosperity.

Advocacy of banking developments from a Post Office point of view does not commit one necessarily to the setting up of a National Bank controlling credit. That would be the function of the Bank of England in any case, and if nationalisation of Banking was aimed at, there again it would inevitably fall to the Bank of England to control and direct operations.

One is confined, therefore, in this review to a consideration of the facilities for deposits and transfer of money, or in other words, an extension and development of the Postmaster-General's present powers until he could really be termed the banker of the people. Many years ago the Postmaster-General opened a banking shop, and straightway announced to all possible customers that he would do only a little business, just a little, with each customer.

It would be difficult, if not impossible to find a similar situation in the industrial world. A greengrocer might just as logically open his business and announce to his clients that he could only sell them a pound of apples or two pounds of potatoes. No more - oh, no, it would not be good for the seller and the buyer. All big orders must go to Mr. Smith the big greengrocer a mile away. Happily for our reputation as a trading nation, we do not find the greengrocer or the butcher committing hari-kari. If they did, the undertaker would soon have an opportunity accorded him of doing unlimited business, and it is almost time that in a nation of traders the Postmaster-General, as a banker should set his house in order, and cease to send potential customers to Mr. Smith or Mr. Barclay round the corner. The restrictions which have hedged the British Post Office Bank round and about ever since its inception should be swept away definitely and for ever.

Owing to war emergency those restrictions have been modified, but in this instance war-time emergency is identical with peace-time necessity, and there seems no reason why the loss of deposits to other savings banks, not subject to restrictions should be continued. The loss to the State is definite and yet preventable, and no manager of a private concern would long retain his post, who allowed such a leakage to continue. But the restrictions which operate in the case of the savings bank are not the only instances in which the Postmaster-General figures, functioning in his capacity as a banker.

There would seem to be no reason beyond the antagonism of the great joint stock capatalist banks, why one could not open an account with the Postmaster-General's bank, and pay bills by cheques, in precisely the same way as one can with an ordinary private bank.

A number of so-called banks have failed during the past few years, and on each occasion, we have had an outcry in the Press against the looseness of the system, and pointing out the ease with which a bank so-called can be set up, and allowed to accept the money and deposits of the public. On the other hand we have the Post Office with its unrivalled network of offices in every town and village, with machinery for dealing with such a business, unexampled in the history of the world, refusing to satisfy a crying need in our vast and complicated modern industrial world. Some of the organisations which have failed, have had none too savoury a reputation, and their appearance in the bankruptcy court has caused unutterable distress and misery to thousands of widows and orphans. Has it no moral responsibility in this matter, when the machinery is ready to its hand ?

The managers of defaulting concerns had the acumen to discern what appealed to the small depositor, to the members of the lower middle class, or the better paid artisan class. Thousands upon thousands of small men would be only too glad to open an account at the Post Office Bank, if they were accorded the opportunity, and perhaps members of this Society would not be altogether absent in the rush which would take place. The announcement of the initiation of such a step would cause a run of quite a different character to that usually experienced by banking institutions and it cannot be alleged that predecents do not exist for such a step. Even in Austria, to take one instance alone, an account can be opened, with a minimum of £4 in the Austrian Postal Bank and bills can then be paid by cheque. The extension and development of the Post Office Banking system should not stop even with the adoption of the reforms indicated.

We have lately heard a good deal and are likely to hear a good deal more, about the Postal Cheque system.

It is a matter of some surprise, and illustrates to what an extent we are dominated by financial interests, that the Continent is so far ahead of us on this question. It has long been adopted and worked with a maximum of success by almost every Continental country, and some of the latest figures which are available are startling in their revelations of the extent and ramifications of the Postal Cheque system abroad.

In SWITZERLAND at the end of 1919 *account holders* numbered 33,780, the *turnover* was 16,700 mill. francs, *international transactions* were 12,169, and orders were issued for 1,700,000 francs.

In GERMANY at the end of 1919 there were 437,667 accounts. At the end of 1920, 622,343: an increase of 42 per cent. over 1919. *Turnover* 1920 683,900 million marks; 187 per cent. increase over 1919. *Capital* of account holders. 1920 7,600 million marks; 123 per cent. increase over 1919. *International Service* 1919: Transfers on Hungary 90; reverse direction 80. Transfer on Switzerland 4,890; reverse direction 9,160. Transfer on Belgium 30; reverse direction 140.

In CZECHO-SLOVAKIA Started 1918. At the end of 1919 the *account holders* numbered 42,995. Capital 1,402 million crowns. *Transactions* 1918 866,741; 1919, 19,948,496. *Net Profit* 1919, 9,885,160 Crowns.

Such figures are startling in their implications, and it must not be forgotten that our network of Post Offices is far superior to that of the majority of Continental countries in many respects.

It needs, therefore, little effort of the imagination to visualise the extensive ramifications and wide organisation of the system which would in a short time be elaborated if it were adopted in the United Kingdom. It would simplify accounts, do away with an enormous number of duplicate calculations, and as far as the country post offices and agricultural transactions are concerned, it would be an immense help in encouraging and stimulating by ease of settlement, all the work of the busy country side, whether conducted by farmers or smallholders. I do not think I should be justified in wearying an audience

Digitized by Google

of this character with a close exploration of the details of the Postal Cheque system, but perhaps a brief sketch would be useful.

If I possess a postal cheque account and desire to send a remittance to an individual who also holds an account, I simply fill in a form, hand it over the counter at any Post Office, or forward it by letter in the ordinary way. The necessary amount is transferred forthwith from my account to his. Even in cases where the sender has no postal cheque account the system operates, for upon payment of a small poundage the money is transferred to the necessary account. Take a practical case. If I desire to pay the rent, or the doctor's bill, I should simply fill up a form for the necessary amounts to be transferred from my account to those of the landlord and physician. It saves an infinitude of trouble and is a godsend to those, who, not having the means to keep a large account, standing in a private bank yet desire the convenience of paying their accounts by cheque. Amounts can also be withdrawn, and paid in by means of the money-postman at a private address. Perhaps the Post Office will explore this side of the development question as one factor towards solving the problem of part-time labour.

When an account under the Postal Cheque system has been credited with a particular amount, the payee is notified, and the sender can always obtain confirmation from the Post Office of the transaction if he should chance to lose his official receipt. The system is unquestionably of great utility to societies of all kinds.

In the majority of Continental countries members of societies or Trade Unions can pay their subscriptions at any Post Office in the sure and certain knowledge that it will be transferred at once to the account of their societies. It can be seen at a glance what an enormous saving of typing, duplicating, letter writing and accounting this means. The only objection which can in all seriousness be urged against the system is that the revenue is diminished from money and postal orders, etc. This is perfectly true, but the profit from the system itself is proportionately so enormous that, from the unanimous experience of countries that have adopted it, one can safely say that where a penny is lost, a shilling is gained.

Continental societies of all kinds, business firms, and hundreds of thousands of individuals, use their Post Office bank, and it is time that Britain ,the workshop of the world, followed suit. The real obstacle to the institution of the machinery in this country, however, is, as everyone knows, opposition from private and joint-stock banks. On this phase of the question, the effect of the institution of a State bank is, I believe, somewhat exaggerated.

For a period of time following the initiation of the experiment it is probable the result on the turnover of the private banks would not prove to be as great as might be anticipated. The first effect would be the exploitation of what has hitherto been an almost untapped field; untapped, that is, except by bogus and mushroom concerns, and the mobilization of previously unattached financial resources would be of distinct benefit to the nation.

A new factor too, has supervened in recent years, a factor to which, sooner or later—and the sooner the better—the Government must give serious heed. I am referring to the extensive amalgamations of banking interests which have been continuously proceeding for some time past. We have a situation emerging in which the financial position is largely dominated by a few huge joint stock concerns of tremendous wealth and potentiality. Hitherto they have been conducted, as far as one can gather, in a manner comparatively restrained, and with a good deal of regard for the interests of the nation as a whole.

That statement, however, contains no guarantee for the future, and it may be that the Government of this country at some time or other, will find a situation arising in which the existence of a stable, well developed, extended Post Office bank will be not only an indispensable supplementary to the National Bank of England, but also the only possible guarantee against a financial attack on the State.

The institution of the penny post has always been regarded as something which the service had every reason to feel proud of, and the public in time came to regard it as one of those good old British institutions which had come to stay. Scarcely one of the innovations which the war brought in its train caused so much regret generally as did the disappearance of the penny post.

The cost of living is now showing an appreciable drop, we are within hail of the penny fare on the 'buses, tubes and trams, and an increasing desire will certainly manifest itself for the reinstitution of the penny post.

One is aware of the almost insuperable difficulties standing in the way, but immediately the condition of Post Office finance allows, the service will heartily join with the general public in a desire for its re-introduction, even in a modified form. This would be by far the most desirable development of Post Office services on the purely postal side that could be accomplished for some time to come. The resultant increase in traffic would be of such a character as to contribute its own quota towards the diminution of unemployment, and increased prosperity both postal and national.

There are, however, a number of comparatively minor reforms which even now could be considered for adoption on the postal side. Taken separately they may not perhaps be estimated to be of prime importance, yet taken in bulk they would prove of great utility to the nation. The majority have succeeded abroad and in this category can be placed automatic stamp-machines. Surprise is occasionally expressed that this comparatively recent innovation of the Post Office has not been adopted more extensively.

A reason which would be somewhat difficult to explain to the public undoubtedly exists, but adjustment should certainly not be impossible, nor a departmental difficulty allowed to stand in the way of the adoption of a public benefit.

One contrasts the facilities which are offered to the public for writing purposes abroad, with the miserably meagre opportunities in Great Britain. It is perhaps a question of economy, yet the experience of Continental countries leads to the belief that expenditure incurred thereby is returned a hundredfold, and this lesson some of our great multiple concerns have learned and applied.

On long-distance trains the absence of letter boxes is an anachronism. It would be of great benefit to business men who frequently deal with their correspondence whilst travelling, from the saving of initial delay, and the earlier reply.

Newspaper delivery through Post Office agency is one other source of profit not yet exploited, and its initiation would save the wasteful spectacle of different news lads, or girls, distributing papers in the same street and covering precisely the same ground with the concomitant loss of time, labour and money.

Advertisements and advertisement revenue is another item which has received but tardy attention. It is capable of infinite development and if tackled in an artistic spirit the Post Office of the future might become not only very different to the average drab appearance which now confronts us, but something of positive attraction. On the practical side it can be said with logic and reason that advertisements would bring in a large additional revenue without substantial increase of cost.

There was almost as much satisfaction on the telegraph side of the service on the institution of the sixpenny telegram, as existed on the postal side at the introduction of the penny post. We seem to have travelled a long way since it was possible to send a wire for the nimble tanner, and perhaps the the best that one can wish for in the way of development for the telegraphs is the speedy advent of that time when the readjustment of prices and costs will enable that happy position to return, even if only in modified form. We shall then witness not only a reversion to the pre-war flow of traffic, but a considerable increase on those figures, the period coinciding in all probability with a substantial trade revival. That would indeed be a welcome development, but pending the millenium arriving it is perhaps permissible to wonder whether the full possibilities of urgent and non-urgent telegrams as traffic and revenue producing agents have been fully explored. Joint departmental and staff consideration of such a potential subject is certainly desirable.

On the subject of deposit account telegrams, too, the view is sometimes expressed that perhaps an extension of the system might be adopted. In the case of a commercial traveller on his round representing a large firm, it is often the fact that the decision as to whether a wire or letter should be sent is one of personal convenience. There should be no great difficulty in allowing the deposit system to function in these cases within fixed limits. The question too, whether a flat rate for telegrams is not an anomaly, and whether some modification of the system is not desirable whether in the direction of a zone system or in othe ways, is surely ripe for consideration.

On this subject the question should be tackled jointly by the staff organisations and the department, for the possibilities from all points of view, are manifold.

The Washington Conference has just adopted a far-reaching and sensational principle on the question of disarmaments—a step which we all, I believe, in this country rejoice, and rejoice whole-heartedly to see taken. But I am not sure that all the implications of the step have been recognised. It has been argued that one of the logical outcomes of the naval decision is the complete international control of communications. Without committing oneself to such a far-reaching theory, it yet would seem that there is a good deal to be canvassed in the suggestion. Arrangements will have to be made by the States concerned to see that the agreement arrived at is faithfully carried out.

It would be unthinkable that States which are loyal to the pact should be exposed to sudden and treacherous attack by unscrupulous neighbours. The best method of guarding against such an eventuality remains to be considered, but control of communications, or oversight of communications would certainly fall within the ambit of consideration. This country found that the method was of incalculable benefit during the progress of the war, and the records of the censorship would doubtless reveal the story of many surprise attacks being happily frustrated.

It is to be hoped that the Government from an imperial view will take a definite stand and that the extension of wireless schemes will be completely under the control of and managed by the State.

One cannot praise too highly the enterprise which initiated the Imperial Transatlantic Cable, and the excellent results which have flowed directly from that work. But here again the Government must make up its mind precisely in which direction it is going. It cannot embark on such an enterprise and continue as an ordinary competitor with private capitalistic concerns in the same line of business. Such a condition of affairs could not go on indefinitely. Sooner or later influences would arise, governmental or otherwise, which would seriously affect the stability of one side or the other. If the Government remains in the business it must remain in as the supreme factor as far as Great Britain is concerned.

The after-war allocation of cables has presumably not yet been settled and it is conceivable that diplomatic and financial considerations may make the public consideration and discussion of such a subject inadvisable. One is, therefore, debarred from touching on what perhaps is the most interesting phase of the development question on the telegraph side of the service.

It is permissible, however, to express the hope that if the subject be considered of such paramount importance as to merit discussion at the

Digitized by Google

Washington Conference, that our delegates take the strongest possible line. One may hope though not perhaps indulge in expectation that the two English speaking countries would mutually agree that all wireless and cable working should be under national and international control.

The naval situation provides an opportunity which is not likely to recur and administrations will be weighed in the balance and judged by future generations according to their acts and decisions at such a golden moment.

The Insurance business of the Post Office is surely in as curious a position as could well be imagined. We possess a system with such adequate machinery for extension and amplification that it could be made to embrace the whole insurable population of the country. The actual position, however, is that the very existence of a Post Office insurance business is almost unknown. It is probable that a large proportion of the population of this country are not even aware that one can insure through the medium of the Post Office.

It is also probable that those who are aware that a scheme exists, have but the faintest notion what particular form of insurance it embraces. There is something inherently wrong for such a condition of affairs to be in existence and it is not a matter for wonder that it was possible for the Parmoor Committee in 1920 to damn the management of industrial assurance with faint praise when a State insurance department almost fails to function.

Insurance is such a recognised element in modern social and industrial life that its existence is regarded as axiomatic. The public take it so much for granted that its relevance and fitting place in the scheme of things receives little attention.

The enquiries which have been made, however, indicate, as might have been expected, that the defects of management by private undertakings are numerous and varied. So obvious, and outstanding are the faults as revealed by Lord Parmoor's Committee that the State should seriously consider whether the whole of the insurance business should not be monopolised under State management.

There are about 18 companies engaged in industrial insurance and some of these are enormous concerns, one company possessing funds of £90,000,000.

In 1918 the total premiums received by industrial companies was over £25,000,000, there being 51,000,000 policies in existence. In carrying on the business of these companies there is an immense amount of overlapping and duplication in machinery, involving a tremendous waste both of time and money. Armies of collectors are kept at the labour (unproductive in the proper sense of the term) of collecting weekly sums and canvassing for fresh customers. Rival agents often traverse the same streets and compete for new policies. The financial part of the business is even more staggering. Management expenses, including commissions and dividends, reach an astounding figure, about 44 per cent. of the total premium income going in such expenses. Of £25,000,000 per annum received in premiums £11,000,000 is utilized for expenses, and only £14,000,000 received in benefits.

Perhaps the worst features of the system are the number of insurance policies which lapse, giving the policy holders absolutely nothing for their money. In 1913 nearly 5,000,000 policies lapsed, of which nearly 4,000,000 had only been taken out in 1912-13. About 4,000,000 policies taken out in any given year lapse in that year or the year following.

It may be argued that if a policy drops it is the fault of the policy-owner in not keeping up the necessary payments. That, no doubt, is true, but under the present system we find that agents often do not call for premiums for weeks at a time. It is not difficult to realise the position in many homes when eventually he does call. The system of commission on new business does not tend to prevent this happening. There is no remedy for this condition of affairs as long as the employment of numbers of competing agents working on a commission basis for competing companies continues.

There are perhaps several reasons why the Post Office insurance system has comparatively speaking failed.

First and foremost comes the question of publicity.

For practical purposes one can say this does not exist either by way of advertising or canvassing. As far as can be ascertained the insertion of a leaflet in Post Office savings bank books is the only effort that has been made. The principal reason for the timid policy pursued by the Government in regard to insurance is not in doubt. A deputation from the Postal and Telegraph Clerks' Association in 1917 urged the Postmaster-General to popularise the insurance section, and he then declared frankly that the opposition of the companies prevented him from acting. In face, however, of the Parmoor report can that attitude still be maintained?

The Postmaster-General could now approach the problem from a fresh position and in view of the findings of that report he would discover that public opinion was on his side. The advantages of State insurance are (1) avoidance of wasteful competition caused by commissions, multiplication of offices, staffs, agents, directors' fees and dividends. (2) Avoidance of high proportion of lapses. (3) Decreased premiums or increased benefits due to the operation of (1).

In almost all sections of its organisation the Post Office attitude in the past and as far as one can judge in the present also is timidly to draw back from embarking on fresh undertakings, which would be of great advantage to the nation.

One hopes that in the future a different view will be adopted for it is inconceivable that so vast a business organisation with its branches and agents everywhere should permanently be debarred from indulging in these supplementary forms of enterprise which, apart from the benefit they would confer would bring in an additional income without materially increasing the present standing charges.

Proposals for the development of the Post Office as of any other business undertaking are bound in the nature of things always to be of a fluid character. Business, industrial life and national expansion are ever and always changing and development plans must be adopted and fitted to the fluctuating and kaleidescopic circumstances of the time.

It would be folly to lay down fixed and rigid plans and an excellent proposition at a given time might be altogether unsuitable five or even a less number of years later. One does not, therefore, either criticise or welcome development in a particular section of the service from a settled angle. Rather is the broad point of view the only one possible in the circumstances, *i.e.*, that the Post Office organisation and machinery is far-reaching and unrivalled, and on it, therefore, it is possible to erect other public services of utility and benefit to the nation. Each particular suggestion must be examined necessarily in the cold light of fact and practicability.

That is all those who believe in the possibility of development have ever asked or suggested, except that on this, as on any other principle that might be advanced, there is a psychological moment for advancement. I have little doubt that the course of a few years will see the time arrive when the moment is favourable if indeed it is not almost upon us now. A great deal will then depend upon the attitude of those in whose hands the decisions will rest.

Only time will tell, but whatever the course taken one can hazard the prophecy that in the future as in the past the Post Office will take its share in the industrial development of the nation.

Whether that will be carried out from force of circumstances, or whether such a movement will be initiated, guided and encouraged into the most useful channels will be for Post Office administrators themselves to consider and decide.

MODERN WIRELESS TELEGRAPHY AND TELEPHONY.

BY F. ADDEY, B.Sc., M.I.E.E., FELLOW I.R.E.

(*Continued from page* 44.)

Transmission.

In the preceding pages the various arrangements used at a receiving station to indicate the passage of electric waves have been described.

We will now consider the means by which these waves are produced.

It has been explained above that a transmitting station, in order to produce a signal, may either send out a series of detached trains of waves with the amplitude of the separate waves in each train gradually decreasing, as shown in Fig. 5; or the waves may be sent off steadily and with constant amplitude during the whole signal.

The first type is known as "damped wave transmission" or "spark transmission." The second type is known as "undamped wave transmission" or "continuous wave transmission" (contracted to "C.W.")

Spark Transmission.

The arrangement used for the production of damped waves is shown in Fig. 21.

In this diagram A represents an alternator which is joined to the primary coil P_2 of a step-up transformer. The Key K is inserted in the leads between the alternator and the primary of the transformer. The secondary coil S_2 of the transformer is joined through the two inductance coils L_2 L_2 to a "spark gap" G. This latter, in its simplest form, consists of two insulated metal rods or balls placed near to one another. These are called the "electrodes" of the gap.

Across the spark gap is joined the condenser C_1, the primary coil P_1, of an oscillation transformer and an adjustable inductance L_1. The Secondary coil S_1 of the oscillation transformer has one end joined to earth through a current indicating device I, while the other end is connected through the adjustable inductance L to the aerial.

Digitized by Google

We thus have an open oscillatory circuit consisting of the aerial the adjustable inductance L, the secondary coil S_1 and earth, coupled to a closed oscillatory circuit consisting of the condenser C, the primary coil P_1 and the adjustable inductance L_1. The spark gap G in the closed oscillatory circuit is automatically closed when oscillations are taking place, as will be explained later.

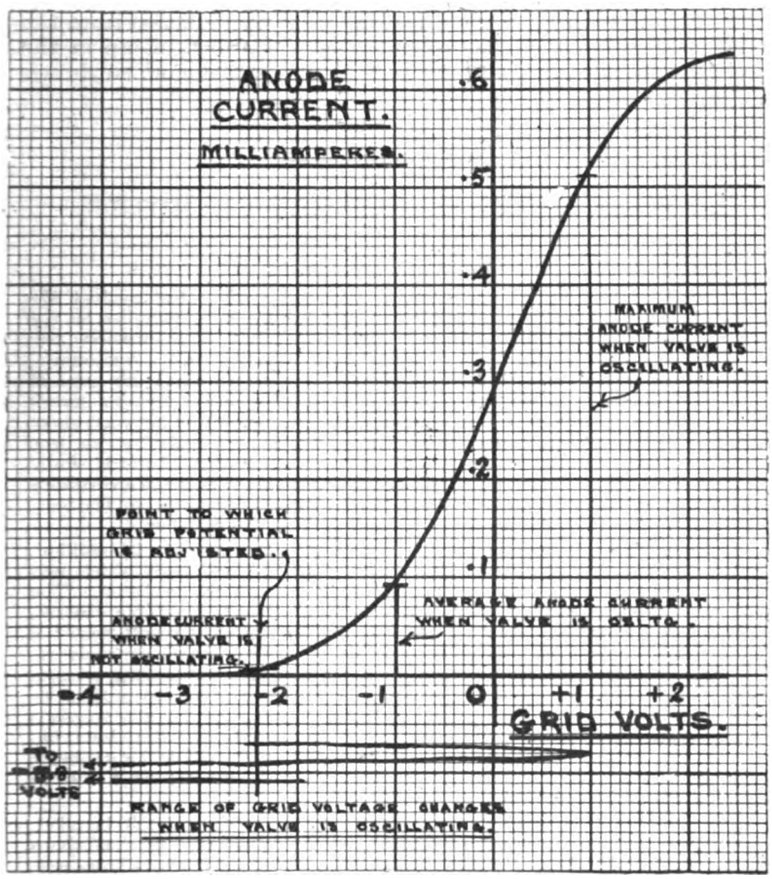

FIG. 20.—VALVE CHARACTERISTIC CURVE SHOWING THE PRINCIPLE OF THE TURNER RELAY.

Both these circuits are adjusted to have the natural frequency corresponding to the wave-length which it is desired to transmit. For instance, if the desired wave-length be 600 metres, the circuits must be adjusted so that their natural frequency of oscillation is 500,000 periods per second.

The frequency adjustments are made by chosing suitable values for S_1, P_1, and C_1; the final adjustments being made by varying the inductances L and L_1.

When the key K is depressed the low-voltage current from the alternator A is allowed to flow through the primary coil P_2 of the transformer. This sets up an alternating current at high-voltage from from the secondary coil S_2. This high-voltage current flows through the inductance coils L_2 L_2, the inductance coil L, and the oscillation transformer primary P_1, into the condenser C_1. As soon as the potential to which the condenser is charged reaches a sufficiently high value the air between the two portions of the spark gap G is broken down and a spark passes. This renders the space between two electrodes of the gap conducting, and the condenser consequently discharges round the circuit C_1, P_1, L_1 with oscillations, these oscillations gradually dying away as explained in the early portion of these articles.

By reason of the coupling between P_1 and S_1 the oscillations in the closed oscillatory circuit set up similar oscillations in the open oscillatory circuit, and consequently a train of damped electric waves is sent off from the aerial.

After the condenser has discharged itself in this way it is re-charged by more current flowing into it from the secondary S_2 of the transformer, and when it is charged sufficiently another spark occurs at G and another train of waves is sent off.

Thus, as long as the key K is held depressed, sparks will occur at G, and a succession of trains of damped electric waves will be sent off from the aerial.

The function of the inductance coils L_2 L_2 is to prevent the oscillations in the closed oscillatory circuit from passing back into the transformer P_2 S_2, and possibly causing damage. These coils allow the passage of the slowly alternating current from the transformer without difficulty, but offer great opposition to the passage of the exceedingly rapid oscillations from the condenser circuit.

The current-indicating device I, known as the "aerial ammeter" which is joined in series with the aerial, enables the magnitude of the current flowing in and out of the aerial to be ascertained. Since the amplitude of the radiated waves depends upon the value of the current in the aerial, the readings of the aerial ammeter are also an indication of the strength of the signals which are being sent out.

If the closed oscillatory circuit has been properly adjusted, the indications of this instrument can likewise be used to ascertain when the aerial is properly tuned, because when this is the case the current flowing in and out of the aerial will be a maximum.

With the spark gap described above there is no necessary relation between the frequency of the current from the alternator, and the frequency with which sparks occur at G. The sparks will occur more or less irregularly, and consequently the sound produced in the telephones at the receiving station will be merely an unmusical noise. By the use of a special form of spark gap, however, in which, by means of a star-shaped disc rotating between two fixed points, the size of the gap is reduced at regular intervals to the distance across which a spark can pass, but at other times is too wide to permit the passage of a spark, the sparks are made to occur at regular intervals and a musical note is produced at the receiving station.

In the earlier form of rotating spark gap the rotating portion was driven by a small separate motor at any convenient speed, and the frequency with which the sparks were produced, and consequently the pitch of the musical note heard at the receiving station had no relation to the frequency of the alternating current used to charge the condenser. The sparking was not quite regular, as, owing to the alternating supply to the condenser not being in step with the periods of closing of the spark gap, the voltage of the condenser when the spark took place was not always the same, and, if the gap happened to close just at the instant of the reversal in the alternating supply from the transformer, a spark would be missed.

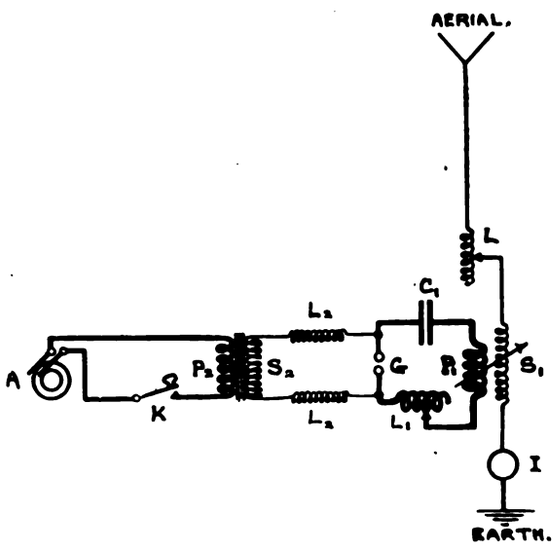

FIG. 21.—APPARATUS FOR SPARK TRANSMISSION.

Digitized by Google

Such an arrangement was called an "asynchronous spark-gap." An improvement has been made by mounting the rotating disc on the shaft of the alternator, and, by suitable adjustments, arranging that the gap is closed at the instant when the condenser is just fully charged by the pulses of current, alternately positive and negative, from the transformer.

By this means the spark does not take place till the maximum charge has flowed into the condenser, and the discharges are perfectly regular, so producing a pure musical note at the receiving station. Since one spark occurs for each positive or negative pulse of charging current, the pitch of the note so produced is double the frequency of the alternating current used to charge the condenser.

It is now necessary to consider more in detail the actions which take place when a spark-transmitting set such as that just described is in action.

The condenser C_1 is gradually charged up, until the voltage between its plates, which is also, of course, the voltage between the electrodes of the spark gap, rises sufficiently high to cause a spark to break across the gap. When this happens the gap is rendered conducting and the condenser discharges with oscillations round the path C_1, P_1, L_1, G. These oscillations are damped, as there are not only the losses which occur due to the various resistances in this path, but also, at each oscillation, a large amount of energy is transferred to the aerial through the coupling between P_1 and S_1. When the oscillations in P_1 start the aerial is quiescent. The first swing in P_1, however, starts a swing in the aerial, and since the aerial circuit and the condenser circuit are adjusted to have the same natural frequency, each subsequent swing in P_1 occurs at just the right instant to help the oscillations already set up in the aerial. These oscillations consequently get bigger and bigger, energy being drawn from the condenser circuit, until the oscillations in that circuit are completely damped out. When this occurs we have all the energy which was originally stored in C_1, with the exception of that lost in the various resistances, transferred to the aerial circuit, in which it now exists in the form of electrical oscillations.

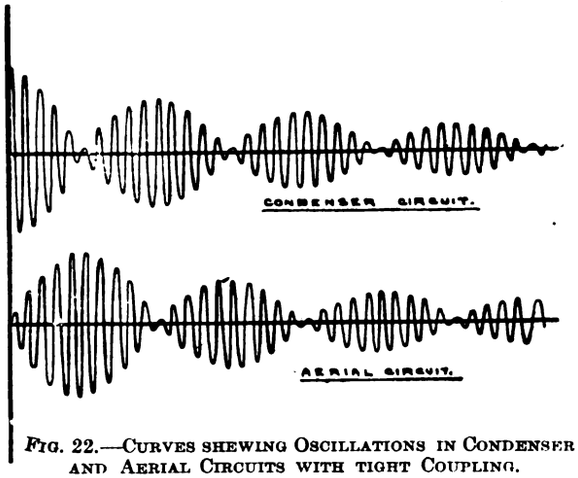

FIG. 22.—CURVES SHEWING OSCILLATIONS IN CONDENSER AND AERIAL CIRCUITS WITH TIGHT COUPLING.

The spark gap G does not immediately return to its original non-conducting state. At the instant when the oscillations in the condenser circuit stop, therefore, we have the aerial circuit in strong oscillation coupled, through S_1 and P_1, to a closed oscillatory circuit, the condenser-circuit, the spark gap in which is still in a more or less conducting state. Unless the coils S_1 and P_1 are widely separated, so as to weaken the effect of oscillations taking place in one of them upon the other, or, as it is expressed technically, unless the coupling between these coils is "weak" or "loose," similar actions to those just described will take place in the reverse direction, the oscillations in the aerial re-igniting the spark and gradually building up oscillations in the condenser circuit. The energy in the aerial circuit is thus gradually transferred back to the condenser circuit till at last the oscillations in the aerial are entirely damped out. The condenser circuit is then again in full oscillation, although the oscillations are not so strong as at first, because in addition to the various resistance losses, a considerable amount of energy will have been radiated away from the aerial in the form of electric waves, which, of course, is the object aimed at.

The oscillations which are now taking place in the condenser circuit again set the aerial into oscillation, and the same series of actions takes place. Thus, at each spark, the condenser circuit and the aerial circuit are alternately set into oscillation, these oscillations getting weaker and weaker, as the energy is gradually dissipated either in the various resistances or by radiation from the aerial, until ultimately they cease. The oscillations set up in the condenser and aerial circuits for each spark are therefore as shown in Fig. 22.

(To be continued.)

LONDON TELEPHONE SERVICE NOTES.

Standard Expressions.

FROM time to time there is heard a murmuring of protest against the use of set operating expressions and it may be well to pen a few notes on the subject. The extreme views are, on the one hand that set expressions can be constructed and should be used to meet all conceivable circumstances; whilst at the other end of the scale it is contended that there is no need at all for standardisation, and that telephonists should be left free to invent phrases. The proper course to follow probably lies somewhere between these expremes, but just where it is difficult to determine. If the "go as you please" method prevailed there is small doubt that set forms of words would become customary in certain well-defined circumstances so that the champions of freedom of expression would by practice become converts to the set-expressions even if it were not actually accepted as the standard.

It is generally conceded that some form of set expression is justified, especially when it is considered that the various circumstances which call for speech on the part of the telephonist, can be accurately predicted. The great advantage of having standard expressions is that particular circumstances can be associated with a particular phrase, with the result that the remark is readily understood over the telephone, if it is not always appreciated. In ordinary conversation, lip reading plays a big part in understanding what is spoken. This advantage is lost in telephone conversations, and unfamiliar words are not infrequently misunderstood, whereas the set form of words is grasped immediately; indeed, before they are completed. Standard expressions should pass three tests, in the first place they should be explicit; secondly, they should be brief; and lastly they should not be liable to confusion with other phrases.

The real question seems to be, not whether set expressions should be used, but whether those in use are the best that could be devised. Most of them have stood the test of time, but it is sometimes stated that others have not. In the latter category, to give an example, is the expression "They will probably call you again, will you please replace your receiver." This expression is used following a complaint of premature disconnexion, where it is not possible to re-establish the connexion. Does it pass the three tests? It certainly is explicit; there may be doubts about its brevity, but it is not likely to be confused with other expressions. Who is the judge? Some will say the telephonists who use it; others, the subscribers who suffer (?) it, and still others who will say the observers, who are non-interested parties and can, therefore, judge impartially. A consensus of opinion gathered from all quarters, if it could be obtained, would be extremely interesting and useful. So far as the first-named are concerned, perhaps these notes will provoke correspondence on the subject, which will be welcomed.

London Telephonists' Society.

On Wednesday, Nov. 30, Miss A. C. West's paper "The Voice and its effect on the Telephone Service," was very ably read, on Miss West's behalf, by Miss Webb.

The Chairman referred to the regrettable absence of Miss West on sick leave, and asked for an expression of sympathy, which the audience tendered unanimously.

Miss West, in her paper, emphasised the importance of correct pitch, resonance and articulation, and reminded her audience of the necessity for particularly careful enunciation on the telephone, not only because of the mistakes which must inevitably be made when telephone speech is slovenly; but also because the person addressed has nothing but the voice to express the personality of the speaker, and receives an impression, favourable or otherwise, accordingly.

The paper was followed with keen interest, to which the unusually large number of members taking part in the discussion bore witness.

It is hoped that Miss West's paper will appear in print, as it should prove extremely valuable from an educational standpoint.

On Wednesday, Feb. 18, 1922, the prize-winning competition papers will be read, and a large attendance is confidently expected.

Langham Choral Society.

The Society's next concert, the second this season, is fixed for Tuesday, Jan. 24, when "Elijah" will be performed. A particularly strong combination of soloists has been secured, including Elsa Stralia, Margaret Balfour,

Digitized by Google

Alfred Cracknell, and Joseph Farrington. The last named created quite a furore when the same work was performed last year, giving a fine rendering of the Prophet's part and singing from memory throughout. Mr. Cracknell, a member of the Traffic staff, is promoted this year from the quartet to the principal tenor part, and his colleagues in the Choir wish him well in the ordeal of singing in company with prominent vocalists.

The Langham Choral Society is proud of the fact that, although choral performances are said to be unattractive, they have paid their way. This is due almost entirely to the support received from within the service. There are, however, large numbers of the staff who have not attended one of the Society's concerts, and as it needs a large circle of admirers to enable three concerts at the Queen's Hall to be given each season, they are urged to make a special note of Jan. 24.

The Honorary Secretary, Miss W. M. Nurse, will be happy to forward posters, hand-bills, or tickets, especially tickets, to anyone interested if they will apply to her at 61/3, Shaftesbury Avenue.

Lotos Swimming Club.

Following the Traffic Officers' Team Race at the last London Telephone Service Swimming Gala, a swimming club has been formed in the Traffic branch. A membership of 60 is assured, so that the club should have a useful start. A Committee has been appointed under the chairmanship of Mr. L. Prossor of the Service Section and Mr. J. North of the same section as Honorary Secretary. By the time the spring comes round, it is hoped to have everything organised for a buoyant season in divers ways at Great Smith Street Baths, Westminster.

Culled from the Exchanges.

Trunk Exchange Bazaar.—"One 'Take this' is better than ten of 'God help you.'" It is in the spirit of this old proverb that the Trunk Exchange staff approach the problem of assisting those who suffer as the result of active participation in the Great War. The Trunk Exchange Bazaar has come to be regarded as an annual event, yet so far from that fact reducing the interest taken in it and the effort expended on it, the contrary is the case, and each year's success is capped by an even greater success, in its successor. The prime object in 1921, as formerly, was to benefit "St. Dunstan's" and the "War Seal Foundation," and it would be difficult to find any cause that makes a stronger appeal. The staff of the Trunk Exchange do not do things by halves and they evidently carry into their after office hours' pursuits the same keenness, the same exactitude and the same skill as they give to their daily telephone duties, with the result that Friday, Nov. 18, saw set out at the Memorial Hall such an assortment of useful and beautiful articles as would satisfy the needs and artistic aspirations of the most exacting of purchasers.

It is the privilege of the Trunk Exchange to serve all ranks of Society, from highest to lowest, and the staff are used to carry on business as usual when their hive of industry is visited by the cream of the social world, but not hitherto in their efforts outside the exchange have they been honoured by the presence of one related to the Royal House. That, however, was their good fortune on this occasion when Her Highness Princess Marie Louise opened the Bazaar and the Press photographers made a permanent picture record of Her Highness examining a silver box presented by Her Royal Highness Princess Mary which realised £10 17*s.* for the funds.

The Princess, who set an example of punctuality not to be improved upon by the telephone staff, who have a reputation in this respect, was received by Mr. Preston, the Controller of the London Telephone Service, and several members of the staff were presented to Her Highness who entered at once upon a discussion of telephone matters. In a well-delivered speech, she declared the Bazaar open and indicated the real interest she takes in both the organisation which benefited by the Bazaar. Mr. Preston expressed to her the thanks of the Trunk staff and his thanks were supported by Mr. Roberts, the Secretary of the War Seal Foundation speaking on behalf of the two beneficiaries, and the Princess then paid a visit to each stall and partook of tea. She was presented with two lovely bouquets—one from the Trunk staff, and one on behalf of Sir Oswald Stoll. There was universal regret that Mrs. Preston was unable to be present owing to indisposition.

The sale went fast and furious, and as will be seen from the Balance Sheet below, the total raised exceeded a thousand pounds. It is a truly magnificent achievement, and in the circumstances, we may perhaps forgive those who in the pressure of other interests, forgot to prepare the data which would have been necessary to indicate the precise limits of the Bazaar busy hour and the total sum collected therein. We shall have to do without it now.

The Committee responsible and the staff of the Trunk Exchange are to be congratulated on a striking achievement. If one were not privileged to have met them in their work one might hesitate to believe in the reality of the achieved result, but knowing them one could be certain they would achieve anything they set their hands to. They said "We will raise £1,000." They raised it, with a margin over to make sure! They wish especially to acknowledge their indebtedness to

The staff of the Victoria Exchange for the loan of the sweet stall and to the Victoria Engineers for fitting it up.

The staff of the Nottingham Trunk and Local Exchanges for a donation of £10 to the sweet stall.

The Edinburgh Central Exchange and Traffic staff for a "Highland Laddie" doll which realised £11 6*s.*—and a cake—35*s.*

Lady Stoll for a donation of £2.

Mr. Wood, who was unable to assist with his weighing machines, sent a donation of £5.

The Trunk Exchange Orchestra who supplied such admirable music in the Refreshment Room. The Orchestra organised by Miss Willis (Supervisor) was conducted by her father.

Mr. Mordaunt (Trunk Night Telephonist) and to Mrs. Mordaunt who, in addition to gifts, procured the services of her Grafton Orchestra and herself took an active part. The Orchestra was excellent, and was much appreciated by all in the Bazaar Hall. Mr. Mordaunt supplied the printing of tickets without charge, and in addition obtained the assistance of Capt. Barry Briant, who, not only designed the very artistic cover for the programmes, but assisted by rendering musical items in the Concert Room.

All friends and colleagues (Engineering and otherwise) who assisted to obtain so splendid a result.

Trunk Exchange.

Balance Sheet for Bazaar, Nov. 18, 1921.

£500 sent to St. Dunstans.

£500 sent to War Seals Foundation.

The remaining £5 6*s.* 7¾*d.* will be passed to the fund for providing children of Canning Town with a Xmas Tea.

City Exchange.

The second dance of the season was held at Stationers' Hall on Saturday, Dec. 3. Friends and acquaintances from other exchanges and offices made the large gathering a representative one, and a merry evening was spent with Mr. J. Webb again acting as M.C. The third and final dance of the season will be held at the same hall on Feb. 25, and as the number of tickets is limited, it is advisable to make early application to Miss Castell of City Exchange.

East Ham Exchange.

Ever energetic in the sweet cause of charity, the East Ham Exchange staff organised a bazaar in aid of the funds of the local St. Mary's Hospital. The result more than justified the endeavour and the organisers were able to send a cheque for £26 to the Hospital.

Central Exchange.

By means of weekly collections, the staff of Central have been able to celebrate the season of goodwill by forwarding the sum of £50 to the War Seals Foundation Fund to augment the £40 they sent at Easter.

INSTITUTION OF POST OFFICE ELECTRICAL ENGINEERS.

THE Council is pleased to announce that Lt.-Col. Booth has handed over the sum of £100 awarded to him by the Postmaster-General "in recognition of his invention and services in connexion with improvements in telegraph working" (Booth-Baudot duplex) to be utilised at the discretion of the Council in annual awards for the best improvement in telegraph land-line apparatus or systems.

An annual award of £5 (to be known as "The Booth-Baudot Duplex Award") is therefore offered for the best improvement in telegraph land-line apparatus or systems, to be governed by the following conditions:—

1. British subjects only, employed by public telegraph administrations throughout the world, will be eligible to compete for the Award.

2. Applications for the Award to be received between January 1 and Mar. 31 of any year, such applications referring to improvements made, or suggested, during the twelve months prior to Jan 1. referred to above.

3. At the discretion of the Council of the Institution of Post Office Electrical Engineers an award may be withheld in any year, if, in the opinion of the adjudicators appointed by the Council, after full consideration of the applications received no Award is warranted.

4. Applications for the Award, accompanied by full details of the improvement should be addressed to THE SECRETARY, Institution of Post Office Electrical Engineers, G.P.O. West, London, E.C.

CORRESPONDENCE.

TO THE EDITOR OF THE "TELEGRAPH AND TELEPHONE JOURNAL."

In the leading article (December) "A 'Lesson'" you say *inter alia* "Again Herbert Spencer is quoted as saying that the telephone was unknown in English cities other than London in 1882. A little research would have shown that Manchester was opened in 1879 . . . and during the following two years Liverpool and other towns in Lancashire, Scotland, South Wales, Birmingham and other places obtained telephone service."

With a view to strengthening your argument and rendering our historical records as correct as possible, may I remind you that in my serial articles on "The Dawn of Telephony in Birmingham" which commenced in the "T. & T. J." in November 1915, I pointed out that the Birmingham Exchange was opened in 1879, and one at Wolverhampton in 1880. I also referred to these in a letter on "The first Telephone Exchange in Europe," which appeared in the issue for December 1917, in which I quoted also a paragraph appearing in a circular issued by the Midland Telephone Co. Ltd. in October 1880 which ran as follows:

> "Over 60 firms in Birmingham (as will be seen by the annexed lists) are availing themselves of instantaneous communication with each other by means of this Company's telephonic exchange. The London Exchange has over 800 subscribers, Liverpool and Manchester about 300 each, besides an increasing number at Glasgow, Sheffield, Bristol, Dundee, Leeds, &c."

ARTHUR E. COTTERELL.

Dec. 7, 1921.

LONDON TELEPHONE SERVICE DINNER.

UNDER the auspices of the London Telephone Service Supplementary Clerks' Association, a Dinner and Concert took place at the Dean Hotel on Nov. 23. There was a large muster of members and the guests included Mr. G. F. Preston, C.B.E., Controller, Messrs. J. F. Stirling and J. F. Edmonds, Assistant Controllers, Mr. H. G. Trayfoot, Headquarters Traffic Dept., and others. A letter of regret for inability to be present was read from Mr. W. A. Valentine, Deputy Controller. Mr. C. W. Muirhead, Chairman of the Association, occupied the chair.

Major Preston, in responding to the toast of the London Telephone Service, referred to the magnitude of the service and congratulated the members on the manner in which the gigantic task in connexion with the revision of the tariff had been carried out. In London, despite the difficulties which they had to encounter, they had one of the best telephone systems in the world. It was necessary for them, in order to be of the greatest possible use to the Service, to acquire knowledge of other departments than their own and he believed that the Whitley system would help in spreading such knowledge. Staff Associations could be instruments of great benefit in this respect.

Mr. Stirling, in proposing the toast of the Association, said that such Associations could do much to foster and encourage a spirit of mutual helpfulness within the Service. The discussions which took place between the representatives of the Association and the Controlling Officers tended to better understanding and the well-being of the Service. Associations, like individuals, must put before them high ideals—they must have moral as well as material platforms. No Association with the best will in the world could give its members equality of mental endowment but it could endeavour to obtain equality of opportunity so that the best men could have a chance of coming to the front. He advocated a pride not only in the service generally, but in the Department to which they belonged, a belief that they were giving to the public a service of which they had reason to be proud. Every member should be an apostle of that belief. He wished the Association prosperity and success. Progress sometimes seemed slow but it was more important to have that progress sure and within it the elements of stability.

Mr. Muirhead in reply, after referring to the happy and sympathetic way in which the toast had been proposed, said that their Association was something more than what was the popular conception of a Trade Union. They sought, it was true, to obtain better conditions of employment and to secure the redress of such grievances as might exist or arise. These were worthy and legitimate aims but they had other aims as well. They sought, equally with the official side, to improve organisation and machinery and to promote efficiency. Referring to their relations with the three Whitley bodies—the National Council, the Departmental Council and the Office Whitley Committee—he believed that, notwithstanding the criticisms of Whitleyism, criticisms mainly confined to its working and not to the thing itself, Whitleyism had been, and would be still more in the future, productive of great benefit to the Service and to the State.

Mr. Hinshelwood, Secretary of the Association, in proposing the toast of the Guests, referred briefly to the better understanding which had arisen as the result of frank discussion on staff questions and Mr. Trayfoot, in reply, expressed his pleasure at meeting with old colleagues and referred to the growth which had taken place in the London Telephone Service during the last decade.

An enjoyable musical programme, under the direction of Mr. W. R. Bourchier, was carried out, the artistes including Mr. Willoughby Walmisley, pianist (from Queen's Hall), Mr. Hugh Williams, tenor, Mr. E. Jacob, baritone, and Mr. E. Widdup, humourist. Mr. A. H. Harris officiated at the piano.

PERSONALIA.

LONDON TELEPHONE STAFF.

The following resignations took place on account of marriage:—

Miss O. E. YOUNG, Assistant Supervisor, Class II, of Paddington Exchange.
Miss F. M. JARVIS, Assistant Supervisor, Class II. of Trunks.
Miss M. A. LOHAN, Telephonist, of Paddington Exchange.
Miss A. C. COLLINS, Telephonist, of Trunk Exchange.
Miss B. L. MERRITT, Telephonist, of Regent Exchange.
Miss M. FOWLER, Telephonist, of Regent Exchange.
Miss W. KNIGHT, Telephonist, of Putney Exchange.
Miss G. L. BETTS, Telephonist, of Gerrard Exchange.
Miss D. M. ARMITAGE, Telephonist, of Gerrard Exchange.
Miss G. D. SMITH, Telephonist, of Sydenham Exchange.
Miss G. F. WARDLE, Telephonist, of Central Exchange.
Miss F. E. WEIMAR, Telephonist, of Central Exchange.
Miss. F. E. WEST, Telephonist, of Central Exchange.
Miss D. G. SHUTTLEWORTH, Telephonist, of Central Exchange.
Miss S. TRUSCOTT, Telephonist, of Victoria Exchange.
Miss W. E. HENDERSON, Telephonist, of Victoria Exchange.
Miss H. BILSBY, Telephonist, of Avenue Exchange.
Miss A. D. CHALLEN, Telephonist, of Avenue Exchange.
Miss L. W. HILL, Telephonist, of North Exchange.
Miss E SUCH, Telephonist, of North Exchange.

PRESENTATION TO MR. P. F. CURRALL.

AN enjoyable social gathering of the Brighton District Post Office Telephone Staff at the Old Ship Assembly Rooms, Brighton, on Nov. 24, was the occasion of a presentation to Mr. P. F. Currall, District Manager, Telephones, on his transfer to Birmingham.

Mr. F. W. George, Contract Manager, asked Mr. Horn, the Postmaster of Brighton, to make the presentation on behalf of the staff of a silver cigarette box to Mr. Currall and silver entree dishes to Mrs. Currall. Mr. Horn, in expressing the general feeling of appreciation for the recipients, traced Mr. Currall's career from Birmingham through Plymouth, Dublin, Newcastle-on-Tyne, London and Brighton, back to Birmingham. He knew that Mr. Currall would leave behind him in Brighton many good friends who wished him health and prosperity in his new business sphere.

In responding, Mr. Currall said in his 5 years at Brighton he found the work congenial and the staff loyal. When he first came to Brighton the district contained 74 exchanges with approximately 10,000 telephone stations. There were now 149 exchanges with approximately 23,000 telephone stations, the Brighton district ranking seventh in size in the United Kingdom. Trunk lines had been largely increased and many exchanges had been enlarged and remodelled. His thanks were due to Mr. Horn and his staff for the pleasing associations they had had, and to Messrs. G. Stevenson, A. Lumsden and F. W. George, the controlling officers of the accounting, traffic and contract sections and their staffs. He was proud of the honour which had been conferred upon him and the gifts would always remain with him as an appreciation of their good-will and kind remembrance.

TELEPHONE SUPERVISION.

SOME IDEAS OF THE DUTIES OF A TELEPHONE SUPERVISOR.

THE duties of a telephone supervisor might readily be considered from the following four points of view—not necessarily in order of importance: firstly, to the subscriber; secondly, to the staff; thirdly, to the department; fourthly, to herself.

To the subscriber, by seeing to it that his calls are answered promptly; that his complaints receive attention, that the cause is fully investigated and faults are removed as early as possible: that repeated complaints of a similar nature are followed up, and special action is taken in cases where they appear to be such as should be avoidable and prevented. By seeing to it that verbal complaints receive attention equally with written complaints. The supervisor should realise that if a subscriber learns that his verbal complaints are properly treated, written complaints are prevented, with resultant economy in administration charges. By seeing to it that monitors and telephonists deal tactfully with subscribers. A supervisor should assume that a subscriber who complains has good reason for doing so, and that, if he appears to be irritated and unfairly blames the operating staff for his troubles, this is due to lack of knowledge of the working conditions. It however, seems impossible to satisfy a certain type of subscriber, but these instances are rare and a supervisor should not allow them to outbalance her perspective of the proportion of complaints which are legitimately made. The supervisor herself should deal with the subscriber tactfully, as, if this is done, he is likely to be satisfied that his complaints and troubles will receive due attention, and this leads to a good feeling which reflects itself in the dealings between the subscriber and the staff generally, as well as giving the subscriber confidence in the management of his exchange. It seems to me that much depends upon the treatment of the subscriber by his own exchange staff, as opinions of the service are often framed on the goodwill which exists between him and the exchange officers. It is a mistake for the supervisor to take up an attitude of defence when dealing with complaints. Much better results are obtained when these are listened to attentively, and when it is assumed that they are not made without cause. Above all, the supervisor should deal with the subscriber in an able and business-like manner, otherwise she will unintentionally give him the impression of inefficiency. If a subscriber requires information, the supervisor should answer at once and as directly as possible. If the information required cannot be given, no hesitation should arise in informing the subscriber of the facts, as known, with a promise to furnish the information, if possible, later. Although rules and regulations exist to cover most cases with which a supervisor is called upon to deal, it should be borne in mind that, in cases of doubt, it is her duty to use discretion; to apply a broadminded view to any case, and, in those which appear reasonable, to err on the side of the subscriber, because, after all, the department is in the position of a seller and should encourage business with its customer, the subscriber, by treatment such as would be extended to him in purchasing goods in the usual way of business.

To the staff the supervisor's duty is to see to it that they are comfortable; that their rooms are kept clean, ventilated and orderly; that they are released from duty promptly; that their meal reliefs

Digitized by Google

are given promptly, and that rest reliefs are given when business permits. By seeing that each officer receives similar treatment; that privileges extended to one are not refused to another; that supervision does not become harassing; that encouragement is given and tact used in her treatment of the staff. The supervisor should have some knowledge of the temperament of the individual officer. She should help the telephonists as much as possible, and assist them in their difficulties. She should endeavour to gain the confidence of the staff, and should be always willing to listen if approached on any subject. She should not hesitate to bring to the notice of her superior officers any grievances of the staff, and she should not hesitate herself to put forward any recommendations which she may think desirable for the betterment of the conditions at her exchange.

To the department, by seeing to it that the service is efficient in all respects, by drawing attention to shortage or excess of junctions, unequal distribution of loads, lengthy duration of faults. By seeing that exchange records are kept up to date, proper records made, and that standard markings are used, and renewed when necessary. By drawing attention to faulty maintenance of switchboard, and to parts which are reported missing or incomplete. By drawing attention to building repairs as soon as dilapidation is apparent, and by seeing to it that the exchange is worked economically; that artificial light is not used unnecessarily, and that consumption of fuel is kept at a minimum. She should take an interest in the switchroom and switchboard and see that everywhere is neat and tidy. A well maintained switchroom appears to me to reflect the efficiency of the officer in charge. She should maintain a strict and impartial attitude to the staff. Irregularities should not pass un-noticed; attention should be drawn to them at once because, although they may occur infrequently at first, an example once set often spreads. By seeing to it that operators attend punctually; that standard expressions are used; that switching procedure is followed; that telephonists are in possession of staff and operating rule books, and that they understand fully the procedure set forth therein. She should endeavour to create a feeling of comradeship among the staff, to foster interest in the work with a view to the efficiency of the service generally, and that of her exchange in particular. In her supervision and training of junior telephonists and learners she should insist at all times on a strict obedience to instructions, whilst not failing to let them understand that she is willing to help them when trouble or difficulties arise. She should be patient with the learner, and give encouragement when this is merited. She should not hesitate to report adversely on a candidate who is not adaptable to the work. This, probably, is the most serious and difficult problem the supervisor has to meet, but her duty in this respect is beyond doubt. A telephonist who is not of average standard or lacks interest in her work is a constant source of trouble.

To herself by seeing to it that she keeps fit and well; that she maintains a cheery and alert attitude whilst on duty, that she preserves a true balance between that which matters and that which does not; that important issues are not lost sight of in minor issues. She should appreciate the fact that from time to time difficulties and troubles are inevitable in spite of her efforts, and should not allow these to worry her unduly. She should retain a keen interest in her work, and so, by example, set a standard to those whom she controls.

The ideas are, of course, applicable mainly to an officer in charge of a small exchange, yet the underlying principles embody much that is common to supervision generally and perhaps not only in respect of telephone exchanges.

"S" (Liverpool).

CONTRACT MANAGER, DUBLIN.

Mr. Fred. C. Taylor, Contract Manager, Exeter, has been appointed to the position of Contract Manager, Dublin.

THE TELEPHONE DEVELOPMENT OF THE WORLD AT DECEMBER 31, 1920.

By W. H. GUNSTON.

THE following statistics, which give the total number of telephones in the world as 20,791,000, are made up roundly as follows:—

Official figures	19,390,000
Estimated figures based on last year's figures (mostly official)	1,109,000
Conjectural figures (Russia, Rumania, Finland, Philippines, etc.) based on old official and other figures	292,000
	20,791,000

It will be seen that all but an inconsiderable number were obtained from official figures, and the total may be taken as fairly representative of the telephonic development of the world at Dec. 31, 1920. I am indebted to Mr. V. M. Berthold of the American Telephone & Telegraph Co., for some very full statistics relating to Central and South America, which supply the necessary information regarding a quarter from which it is difficult to obtain complete figures. The information relating to the eight chief telephone-using countries in the world is official, except that in the case of Japan it is based on last year's official figures and that the number of "independent" telephones in America is partly estimated. These countries are:

U.S.A.	13,411,000	telephones.
Germany	1,812,000	,,
Great Britain	986,000	,,
Canada	856,000	,,
France	458,000	,,
Sweden	390,000	,,
Japan	320,000	,,
Denmark	254,000	,,

No other State has over a quarter of a million telephones.

In the British Empire there were over two and a quarter million telephones, viz.:—

	Thousands.
Great Britain and Ireland ...	986
Canada	856
Australia	233
New Zealand	88
India, etc.	46
South Africa	51
	2,260

The tables which follow may be summarised as follows:—

	1919.	1920.
Europe	4,910,000	5,235,000
Asia	466,000	507,000
Africa	70,000	95,000
North America	13,480,000	14,355,000
South America	260,000	277,000
Australasia	294,000	322,000
	19,480,000	20,791,000

It will be seen that out of an increase of over a million and a quarter telephones in the total for the whole world, North America alone accounts for 875,000, while Europe accounts for over 300,000.

Digitized by Google

The total for 1919 has been slightly corrected, in the light of information since received, from the figure shown in the January and February issues of the JOURNAL, 1921.

Eighty-three cities possessed upwards of 20,000 telephones in 1920, 10 having over 100,000 telephones, 33 between 50,000 and 100,000, and 50 between 20,000 and 50,000 telephones. Altogether 188 cities contained 10,000 telephones and upwards, of which 100 were in the United States, 30 in the British Empire (15 in Great Britain and Ireland, 10 in Canada, 4 in Australia, and 1 in South Africa), 23 in Germany, 5 in Japan, 4 in Switzerland, and 3 each in France, Sweden and the Netherlands, 2 each in Italy and Russia, and 1 each in Denmark, Norway, Austria-Hungary, Poland, Czecho-Slovakia, Belgium, Spain, Mexico, Cuba, Argentine, Brazil, and Uruguay. Madrid, Lisbon and Pekin almost qualify for admission in the list with upwards of 9,000 stations each.

TABLE A.

EUROPE.

NUMBER OF TELEPHONES.

	Dec. 30 1920.	Dec. 30 1919.	Population Thousands.	Population per Telephone.
Austria (1919)	114,075	114,075	9,500	83
Belgium	48,943	30,383	7,500	153
Bulgaria (est.)	5,000	4,378	5,500	1,100
Czecho-Slovakia ...	78,177	—	13,000	166
Denmark (220,443) lines	254,000	239,312	2,921	12
Esthonia	3,218	1,896	480	149
Finland (est.)	40,000	35,000	3,000	75
France	458,534	418,898	41,500	90
Germany...	1,812,341	1,767,156	57,000	31

Poland	70,450	36,169	30,000	428
Portugal	15,000	14,000	9,675	645
Roumania (est.) ...	20,000	20,000	17,000	850
Russia, Ukraine, Latvia and Lithuania (est.)...	200,000	200,000	—	—
Serbs-Croats and Slovenes	16,439	—	11,600	704
Spain	75,871	69,191	20,356	267
Sweden	389,830	388,794	5,522	14
Switzerland	152,336	138,843	3,877	23
Turkey	7,298	6,078	2,000	274
Total ...	5,235,000*	4,910,000	400,000	76

* With allowance for Danzig and probable increase in Austria.

Europe it will be seen, now possesses 5,235,000 telephones, an increase of about 300,000 over last year. About 260,000 of this five million odd is a conjectural figure, no recent information being obtainable from Roumania, Greece, Russia, Finland, the Ukraine, Lithuania, &c. The figure for the Russian States has been put at 200,000; it may well be 50,000 more or less than this estmiate.

The number of inhabitants per telephone in Europe is 76; but if that half of the total population of Europe which is comprised in the Northern and Western States (*i.e.*, France, Switzerland, Austria, Bohemia, Germany, Belgium, Holland, Great Britain, Norway, Sweden and Denmark) is considered separately, it will be found that 4,750,000 telephones are contained in this area, an average of one to every 40 inhabitants.

Austria.—Statistics relative to 1920 have not been received. The figures for 1919 have been adopted in the table as it is difficult to gauge the rate of development in this country at present.

Belgium.—The Belgium telephone system has almost regained its pre-war extent. There are now 16,616 telephones in Brussels, and 7,878 in Antwerp.

Denmark.—This is the most highly-developed country in Europe from a telephonic point of view. The number of lines is officially given as 220,443, which may be put at about 254,000 stations. Copenhagen and suburbs have now over 96,000 telephones.

Esthonia.—The number of telephones in the new State has nearly doubled since last year.

France shows an increase of 40,000 telephone stations. Paris has now 159,692, Marseilles 11,794, Lyons 10,937, and Bordeaux 7,347 stations.

Germany.—45,000 stations were added during the year. Twenty-three German towns have systems comprising upwards of 10,000 stations. Berlin has increased from 187,982 to 199,555 stations. Besides the cities shown in table B, Nuremberg, Mannheim, Bremen, Essen, Chemnitz, Magdeburg, Konigsberg, Stettin, Duisburg, and Elberfeld have each over 10,000 stations.

Great Britain added nearly 73,000 stations to its system in 1920. Apart from London, Glasgow, Manchester, Liverpool and Birmingham (see Table B), ten city systems contained upwards of 10,000 stations. Edinburgh had 18,089, Sheffield 14,063, Leeds 13,898, Bradford 13,864, Newcastle 13,850, Hull (Corporation system) 13,209, Dublin 12,479, Bristol 10,850, Belfast 10,437, and Nottingham 10,323.

Hungary.—Information has been obtained from this State for the first time since the War. While of course its system has decreased owing to the diminution of its territory the number of stations in Budapest has increased from 34,755 in 1917 to 37,579.

Iceland has now 2,296 stations, of which 1,229 are in Reykjavik.

Italy shows an increase of over 7,000 stations. Milan has 16,142, Rome 13,806, Genoa 7,843, Turin 7,408.

Luxemburg.—The number of telephones has increased from 5,190 to 5,567.

Netherlands.—Here an estimate has been based on the development in 1919 the progress of the telephone system in Holland being fairly uniform. Amsterdam has over 31,000 telephones; Rotterdam had over 23,000 in 1919, and The Hague 19,800. The latter has now probably over 20,000.

Norway.—The number of stations has increased from 112,395 to 127,709. Christiania has 29,754 stations, and Bergen and Trondhjem each over 6,000.

Poland has 47,450 stations on the State telephone system. The large increase over last year is due to the inclusion of the system in that part of Poland formerly belonging to Prussia. There are about 23,000 stations on the system of the Telephone Co. in Warsaw, making a grand total of over 70,000.

Portugal.—The Anglo-Portuguese Telephone Company has 13,562 stations, of which 9,829 are in the Lisbon district and 3,613 in the Oporto district. The State maintains exchanges in some of the smaller towns.

Serbs, Croats and Slovenes.—Official figures have been received from this Kingdom for the first time since the War. The system comprises 16,439 stations.

Spain.—The total number of stations has increased from 69,191 to 75,871. Barcelona has 10,971 telephones and Madrid 9,831.

Sweden.—There is but a slight increase of stations in Sweden due to the acquisition of the Stockholm Telephone Company by the State in 1918, and the resultant gradual elimination of duplicate telephones. Stockholm has actually decreased from 126,961 to 118,180 stations. Gothenburg had 23,778 and Malmö 11,708 stations.

Switzerland.—The system has increased by about 10 per cent. from 138,843 stations to 152,336. Zürich has 20,023 telephones, Geneva 13,714, Basel 11,619, and Berne 10,016.

Turkey.—The Ottoman Telephone Company has 7,298 stations in Constantinople, of which 476 are allied military lines.

(To be continued).

ANSWER TO CORRESPONDENT.

To Ajax.—Phone Voyance is the word invented by a psychist who claims to possess the power of seeing his correspondent at the distant end of the line and is able to describe him or her, the room, and at times other occupants of the house. See Chap. V. "The Beginnings of Seership," by V. N. Turvey.

MODERN WIRELESS TELEGRAPHY AND TELEPHONY.

BY F. ADDEY, B.Sc., M.I.E.E., FELLOW I.R.E.

(*Continued from page* 62.)

A mechanical model to illustrate the phenomenon just described can very easily be made. The arrangement is shown in Fig. 23.

A piece of twine, four or six foot long, is tied fairly loosely between two fixed points at approximately the same level. Two pendulums are suspended from the middle portion of this piece of twine, the points of attachment being about a foot apart. Each pendulum consists of a length of twine about 3 feet long with any small weight as a bob. The pendulums should be of equal length, so that they each have the same time of swing.

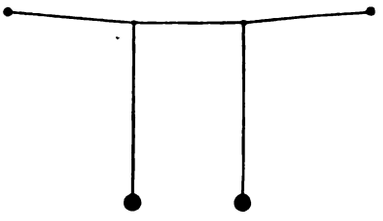

FIG. 23.—DOUBLE PENDULUM EXPERIMENT TO ILLUSTRATE EFFECTS OF VARIATIONS OF COUPLING.

If now the bob of one pendulum be drawn aside at right angles to the supporting twine (towards the reader in the diagram), and then released, it will swing to and fro, but it will be observed that the distance through which it swings gradually gets less, while the second pendulum will be set swinging, the distance through which it swings increasing as the swings of the first pendulum decrease, until ultimately the first pendulum comes to rest, and, assuming that the two pendulum bobs are of equal weight, the second pendulum is swinging through nearly the same distance as that through which the first pendulum was originally drawn aside.

It is easy to see how this transfer of the oscillations from the first pendulum to the second is brought about. At every swing the first pendulum gives a slight jerk to the supporting thread. The first jerk so given starts the second pendulum oscillating, and because the pendulums have the same time of swing each succeeding jerk from the first pendulum occurs at just the right instant to help the oscillation already set up in the second pendulum.

The energy which the second pendulum possesses by virtue of its motion is drawn from the first pendulum, so that the latter gradually loses its energy of motion and so comes to rest. When the first pendulum has thus given up all its energy the second pendulum cannot further increase its swing. The conditions are then exactly the same as at the beginning of the experiment, with the exception that the rôles of moving and stationary pendulums have been reversed. The same action is therefore repeated, the first pendulum being gradually again set swinging through almost the same arc as at first, while the swings of the second pendulum gradually decrease, till ultimately it comes to rest. This interchange of swinging between the two pendulums will continue until the energy which they possess has all be dissipated by the resistance of the air to the motion or by friction in the supporting threads.

If we imagine a pencil to be fixed to each pendulum and a long band of paper drawn under the swinging pendulums at right angles to their direction of motion, it is clear that the traces made by the pencils would be of the same nature as the curves shown in Fig. 22.

The first pendulum corresponds to the condenser circuit and the second pendulum to the aerial circuit in the electrical case. Drawing the first pendulum aside corresponds to charging the condenser and releasing it corresponds to the breaking down of the spark gap.

The coupling between the condenser circuit and the aerial circuit is represented by the connexion between the two pendulums by means of the supporting thread.

Thus with the arrangements shown in Fig. 21, if the coupling between S_1 and P_1 be "strong" or "tight" enough, we shall obtain, for each spark which occurs at G, an oscillation in the aerial which does not die away uniformly, but of which the amplitude pulsates, as shown in Fig. 22. The amplitude of the waves sent off from the aerial will of course pulsate in a similar manner.

It can be shown that such a pulsating wave-train is made up of two superimposed trains of waves differing slightly in wave-length.

The easiest method of doing this is to reverse the process, by taking two wave-trains of different wave-length and combining them. This has been done graphically in Fig. 24, in which, for simplicity, the damping has been ignored.

In this diagram the waves represented by the curve (*a*) have a slightly shorter wave-length than those represented by the curve (*b*). Since the wave-lengths are different the waves will be in step and therefore assisting one another at certain points A; while at points B half-way between these the waves will be out of step and will oppose one another.

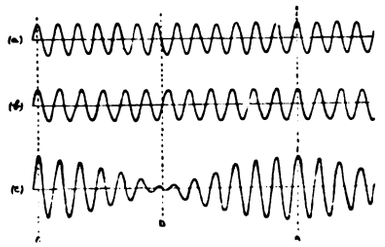

FIG. 24.—ANALYSIS OF A "BEATING" OSCILLATION INTO TWO OSCILLATIONS OF DIFFERENT FREQUENCY.

The resultant wave-train produced by combining these two wave-trains is therefore one on which the amplitude periodically rises and falls, as shown in the curve (*c*).

Hence an aerial circuit oscillating as shown in Fig. 22 can be considered as radiating two trains of waves differing slightly in wave-length.

This is a disadvantage, as only one of these radiated wave-lengths can be fully utilised for actuating the receiving apparatus, while the energy radiated in the form of the other wave-train is more or less wasted, and, further, the second wave-length may disturb some other receiving station.

By reducing the coupling between P_1 and S_1 the rate at which energy is transferred from one circuit to the other is reduced. It therefore takes longer for all the energy to pass out of the condenser circuit into the aerial, or *vice versa*, and consequently the period of each "beat" is prolonged.

This means that the two waves radiated are nearer to one another in wave-length. The reader may confirm this by drawing a diagram similar to Fig. 24, but with the two original waves differing in length more, or less, than is shown in that figure. It will be found that the more nearly alike the original waves are in wave-length the longer are the "beats." Since by making the coupling very loose the duration of each beat may be made very long indeed, we have then practically a single wave-length only radiated.

The reader should try the corresponding experiment with the pendulums. By increasing the distance between the points

Digitized by Google

of support on the horizontal twine the effect of one pendulum on the other is reduced, or the "coupling" is weakened. In these circumstances it will be found that it takes longer for the motion to be handed over completely from one pendulum to the other.

Thus by sufficiently weakening the coupling between P_1 and S_1 we can overcome the difficulty of the double wave. A new drawback is, however, introduced.

With a weakened coupling it takes longer for the energy to pass from the condenser circuit, where it does no useful work, into the aerial circuit, where it is usefully employed in radiating electric waves. There is therefore a longer time during which resistance losses can make themselves felt, and it may happen that these increased losses more than counter-balance the advantages gained by obtaining a single radiated wave-length.

Quenched Spark System.

To overcome the difficulties mentioned above a transmission system has been introduced in which practically a single wave-length only is radiated, while at the same time the coupling used is extremely tight so that the energy is very quickly transferred from the condenser circuit to the aerial circuit. It is known as the "quenched spark system."

Before describing this system it will be advantageous to perform yet another experiment with the pendulum. Bring the points of support fairly close to one another, or in other words, tighten up the coupling. Now set one pendulum swinging as before. Owing to the tight coupling it will quickly hand over all its energy of motion to the second pendulum and will come to rest. When this occurs, instead of allowing the first pendulum to be set swinging again, the bob of this pendulum should be taken in the hand, and lifted up so as to slacken its supporting twine.

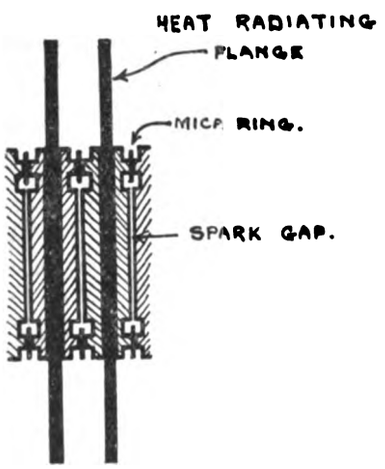

FIG. 25.—SECTION OF PORTION OF QUENCHED SPARK GAP.

The second pendulum is now left swinging by itself, and consequently it goes on swinging steadily until the various energy losses bring it to rest.

The action of the hand in preventing the first pendulum from being again set into motion once it has come to rest is imitated in the quenched spark system by the action of the special form of spark gap which is employed. This spark gap consists of a number of circular metal plates, separated by thin mica rings, and provided with flanges so that the heat produced by the sparking is rapidly radiated away, and the apparatus thus kept cool. A section of a portion of such a spark gap is shown in Fig. 25. The various parts of the gap are held in position by means of a suitable insulating frame. The number of separate gaps used depends on the voltage to which the condenser is charged. It is found that with the total spark gap broken up into a series of narrow spark gaps in this way, and kept cool, the conductivity of the gaps disappears very quickly after the spark ceases. Consequently, after the first series of oscillations in the condenser circuit, when

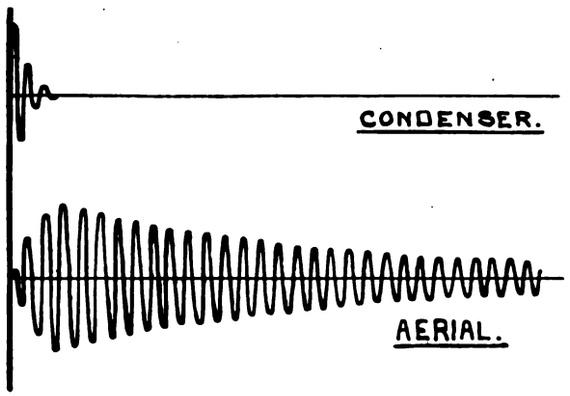

FIG. 26.—CONDENSER AND AERIAL OSCILLATIONS WITH QUENCHED GAP.

the energy has all been transferred to the aerial circuit and the spark has gone out, the loss of conductivity of the gap prevents the spark being re-formed by the reaction of the oscillations in the aerial on the condenser circuit, and consequently the energy does not pass back again from the aerial to the condenser, but the aerial oscillations continue steadily till all the energy in the aerial circuit is either radiated away in the form of electric waves or has been converted by the various resistances into heat. The condenser and aerial oscillations are, therefore, as shown in Fig. 26.

Thus by the quenched spark system the beats of aerial current, which occur when the ordinary spark gap is used and the consequent radiation of a double wave, are avoided.

(To be continued.)

TELEGRAPHIC MEMORABILIA.

ACCORDING to a Buenos Aires authority a French engineering company has obtained a concession from the Argentine Government for the erection of a wireless station for direct communication with France. The concession is for 30 years. The Government has apparently arranged for the transmission of the telegrams exchanged over its own lines and has fixed the tariff.

Reuter's and other kindred authorities have stated that negotiations between the United States and Japan have led to an agreement being reached between them with respect to the Island of Yap and other islands in the Pacific Ocean north of the Equator. The points of the agreement are as follows:—

1. The Uuited States shall have free access to the Island of Yap, on a footing of entire equality with Japan, or any other nation, in all that relates to the landing and the operation of the existing Yap-Guam cable or of any cable which may hereafter be laid by the United States or its nationals.

2. The United States and its nationals are to be accorded the same rights and privileges with respect to the radio-telegraphic service as with regard to cables. So long as the Japanese Government shall maintain on the Island of Yap an adequate radio-telegraphic station, co-operating effectively with cables and with other radio stations on ships and shore, without discriminatory exactions or preferences, the exercise of the right to establish radio-telegraphic stations at Yap by the United States or its nationals shall be suspended.

3. The United States shall enjoy on the Island of Yap the following rights, privileges and exemptions in relation to electrical communications: (*a*) Rights of residence without restriction and of acquisition and enjoyment and undisturbed possession upon a footing of entire equality with Japan or any other nation of all property and interests, both personal and real, including lands, buildings, residences, offices, works, and appurtenances. (*b*) No permit or licence to be required for the enjoyment of any of these rights and privileges. Each country to be free to operate both ends of its cables, either directly or through its nationals, including corporations and associations. (*d*) No cable censorship or supervision of operations or messages. (*e*) Free entry and exit for persons and property. (*f*) No taxes, port, harbour, or landing charges or exactions, either with respect to the operation of cables or to property, persons or vessels. (*g*) No discriminatory police regulations.

Digitized by Google

4. Japan agrees that she will use her power of expropriation to secure to the United States the needed property and facilities for the purpose of electrical communication in the island, if such property or facilities cannot otherwise be obtained. American property and facilities for the purpose of electrical communication in the island are to be exempt from process of expropriation.

A formal convention will be drawn up for signature and will be subject to ratification by the Senate.

The Agreement gives the U.S.A. the right to use the Yap-Shanghai cable for messages to Japan and also the use of the cable to the Dutch Indies.

During the last few months of 1921 one British firm alone supplied and laid no less than 320 miles of twin telephone cable for the British Post Office.

Should these lines meet the eyes of any British contractors whose special feature is telegraph apparatus they may be interested to know that the Madrid Telegraph authorities are asking for Hughes apparatus to the value of 350,000 pesetas.

During the first week in January the Central Post Office of Tokio was completely destroyed by fire.

Further extracts from the report of the Pacific Cable Board for the year ended March, 1921, are worthy of note.

The service of week-end telegrams between the United Kingdom and Canada on the one hand and Australia and New Zealand on the other, was reinstated early in 1921. As is well known this latter class of traffic is only carried across the Atlantic by the Imperial cable, the private companies not yet having re-introduced this privilege.

During the year over 7,700,000 paying words of International traffic (*i.e.*, traffic other than local traffic between Australia, New Zealand and the Pacific Islands) were handled by the Board. This was approximately 1,350,000 words less than the total during the previous year, when more than 9,000,000 words were carried. In addition to the international traffic, approximately 2,600,000 paying words were carried during the year between Australia and New Zealand and between those Dominions and the Pacific Islands. This was approximately 280,000 words in excess of the 1919-20 figure. The ordinary international traffic showed a decrease of more than 500,000 words, while the deferred ordinary and the Press traffic each showed an increase of more than 300,000 words. There was a diminution of nearly 1,200,000 words in the Government traffic, the total handled being less than half that transmitted during the previous year.

In this connexion the Federal Government's approval of the duplication of the Pacific cable scheme is of added interest. So also has been the exchange of correspondence in *The Times* on an Air Mail service *versus* a Cable service across the Pacific, Mr. Holt Thomas taking up the cudgels on behalf of the former and Sir Charles Bright very concisely and very effectively defending the Cable Board project. The critics of the cable scheme appeared to rail at the expense of the duplication, to which Sir C. Bright replied that there was a reserve and renewal fund of sufficient dimensions to more than pay for the duplication so that it would not be necessary "to call on any of the partner Governments for financial contribution." The cable protagonist concluded:—This position is, of course, highly satisfactory to those of us who were, at an early period, active in urging the cause of this line, despite the loud-spoken claims of interested parties to the following effect: (*a*) that it could not be successfully laid in such deep water: (*b*) that if it did happen to be laid it would not work; and (*c*) that if laid and even worked it would be a financial failure on the basis of the proposed tariff!

From Helsingfors comes the information that a combined Russian and Finnish Commission has reached an agreement with reference to telephone, telegraph, and temporary railway communications. Further evidence of the gradual emergence of Russia into the economy of Europe may be found in the news that the transmission of telegrams between Sweden and Russia is now possible. "Radiograms," says a Stockholm informant, "having been regularly forwarded from Karlsborg to Petrograd since the middle of December." An ordinary service has been established in the direction of Russia to Sweden and one in the opposite direction arranged by the Store Nordiske Co. will probably have been established by the time these lines are in type. Telegraphists from the Great Northern Telegraph Company left Copenhagen for Petrograd one or two days before the end of 1921 in order to re-start the services suspended in 1918.

On the 18th ult. official intimation was received, just in time to insert this "Stop Press" memo, to the effect that the Company had established telegraphic communication between Petrograd and Gothenburg *via* Nystad, and that terminal traffic for Russia could therefore be accepted by this route from abroad. The delays from Moscow the following day were announced as somewhere in the neighbourhood of three hours. Those by the British Government route were considerably less.

So as to enable Chile to correspond with the principal European and American stations, the Government is accelerating the installation of wireless stations in various parts of the Republic. The total cost of this project is estimated at £1,385,000.

A liquidator has been arranged for the winding-up of the affairs of the *Societe Industrielle de Telegraphie sans fil* of Paris founded with the meagre capital of 200,000 francs. The voluntary winding-up of the Anglo-French Wireless Company is also announced by the *Electrical Review*.

The Postal Department of Turkestan has prepared a telegraphic Morse alphabet for telegrams in the Kirkgis and Usbek languages. The results on trial were quite satisfactory. Telegrams in the local languages are already being exchanged between Old and New Tashkent.

The Times records a curious and probably a unique official recognition by any Government of services rendered. Moved by the specially generous hospitality of the Ameer of Afghanistan shown to the Dobbs Mission, the Indian Government presented the Ameer with sufficient telegraph material to link up the 460 miles separating Kabul from the Indian telegraph extension at Herat *via* Kandahar.

Under the title of "Changes in Old London," the *London Times* gives an interesting account of the alterations and extensions about to be made in connexion with the premises of the Great Northern Telegraph Co., in St. Helen's Place, Bishopsgate, London. "Here," says our comtemporary, "is a bit of old London which is about to undergo extensive alterations. The Great Northern Telegraph Company have acquired from the Leathersellers' Company the lease of the land on which six old houses are built. The Place is cut off from Bishopsgate by iron railings and a pair of iron gates, and at the end is the hall of the Leathersellers' Company, rebuilt in 1878 on the site of the hall of the Black Nuns of St. Helen's. The property was bought by the Leathersellers' Company soon after the surrender of the old priory to Henry VIII. The whole of the property in St. Helen's Place thus belongs to this latter ancient corporation."

The following somewhat abbreviated extracts from the speech of Sir John Denison-Pender, Chairman of the Western Telegraph Company, at the 88th General Meeting of the Company, was held over from last issue owing to lack of space, but though somewhat belated should prove of the greatest interest to the telegraph world.

"Our new cable from Brazil to the island of Barbados is still lying idle. You will remember that this cable was laid in conjunction with the well-known American company, the Western Union Cable Company, who laid one northward towards Florida from Barbados, at which latter place they received the requisite permission to land from the British Government.

The Western Union cable is still buoyed outside United States territorial waters, and the Western Union and our own cable are still lying idle in consequence of the refusal of the Government of the United States of America to permit the landing in Florida. I hope that a decision on the matter will be arrived at shortly.

In the meantime a valuable direct cable communication between South America and the United States is being held up, and this traffic is at present mainly passing by the lines of our competitors, the All America Company, whose route from Brazil is south to Argentina over the Andes, and north up the west coast of South America.

The renewal of our older section between Lisbon and Madeira, has been effected, and arrangements are now in progress to carry out a similar renewal of the original Madeira - St. Vincent cable early next year by our cable steamer, which will, immediately after carrying out the work, continue her voyage to Brazil and lay the new cable between Pernambuco and Maranham, also other cables connecting Pernambuco and Maceio, and with Victoria and Rio de Janeiro, and a third cable between Rio de Janeiro and Santos, thus materially strengthening our coast connexions. The ship will also carry some further cable to replenish our stock on the coast of South America. This expedition will entail an expenditure of about £700,000, bringing our total expenditure since 1918 on new communications and on renewing older sections of our system up to no less a sum than £3,000,000."

On the same date the chairman of The Eastern Extension Australasia and China Telegraph Company, in reply to certain queries regarding possible developments and competition of wireless, made the following well-balanced remarks:—

"I am not going to prophesy with regard to wireless, but I will give you certain facts and you can all judge for yourselves. Germany was supposed to be well up in wireless before the war, and her only means of direct communication during the war was by wireless. That fact ought to have assisted very materially in making wireless efficient in Germany. At the present time, however, Germany is about, if she has not already done so, to enter into an arrangement with a big Atlantic company for direct cable communication with the United States. Italy is looked upon as the birthplace of wireless, yet at the present time endeavours are being made to obtain direct communication between Italy and Central and South America by cable. I give you these facts but I am not going to prophesy. If wireless communication should prove to be better than cable communication, it will cut us out, but it has some work to do before it is in that position, whatever may happen in the future."

A provisional agreement has been concluded between the United States and Japan to which the assent of Britain, France, Italy, and Holland is sought, allocating as follows the three German Pacific cables: the Yap-Guam cable to the United States: the Yap-Shanghai cable (later to be diverted to run from Yap to the Japanese mainland) to Japan: the Yap-Menado cable to Holland. Later news adds that the five big powers have agreed to an arrangement by which Holland as well as the United States and Japan will be given cable rights on the Island of Yap.

Much satisfaction was evidenced by the appearance of Mr. F. J. Brown's name in the list of New Year's Honours. The British Post Office is proud of its representative who is once again across the Atlantic busy with certain matters in connexion with the Washington Conference—and after.

February, 1922, will be notable in electrical circles as completing the fiftieth year of what was originally known as the Society of Telegraph Engineers which held its first meeting on Feb. 28, 1872, the more comprehensive title of The Institution of Electrical Engineers being adopted some years later. The jubilee of the Institution will be celebrated by a lecture by Professor Fleming, F.R.S., on "Faraday and the Foundations of Electrical Engineering," on Feb. 21 followed by a dinner at the Hotel Cecil. On the 22nd the professor will repeat his lecture and on the 23rd certain members connected with the Institution will give short dissertations on their reminiscences of the early history of electrical supply.

Administrative representatives of the C.T.O. who on Jan. 11 were privileged to attend the private view of the Gaumont film entitled "The Romance of a Telegram" were highly pleased with the quality of the production.

The Conference at Cannes once more showed the pliability of the Baudot system. Two sectors of a Paris-Cannes Baudot were switched through automatic re-transmitters at Paris on to two sectors of one of the London-Paris Triple Duplex sets, thus giving excellent communication between the metropolis and the historic centre. Later, as the Press and Government traffic increased, two more traffic channels were added by the same means through another of the London-Paris duplexes. Eventually yet another pair of channels became necessary and these were readily provided by the French authorities. London respectfully tenders its sincerest thanks to Paris and Cannes for their excellent co-operation. In addition to heavy Government and private traffic, as much as 15,000 words of Press were dealt with in one day.

The latest innovation in the way of apparatus in the London C.T.O. is that of the Teletype, which is at present performing excellent service on the short line between London and Croydon. The system, it would appear, has come to stay.

Lake Tanganyika.—A new telegraph line has been opened between South Africa and Usumbura (Ruanda-Urundi), *via* Brokenhill and Albertville, Katanga.

Germany has established direct telegraphic communication between Koenigsberg and Riga, *via* Memel and Lithuania. This route opens international traffic with the Baltic States and Russia.

The T. and T. Society should be greatly indebted to Mr. H. H. Harrison for his specially interesting paper on "Printing Telegraphy in America," which our esteemed friend delivered before its members on the 16th ult. To a busy business man the personal sacrifice of both time and personal convenience in order to assist the educative efforts of the telegraph profession were unfeignedly appreciated by the audience, judging by the remarks one heard as the listeners left the hall. The paper will in all probability be printed in these columns, but one cannot refrain from remarking upon one surprising piece of information regarding the American telegraphist who, the lecturer remarked, "takes no interest in the technical side of his craft. I was interviewed by a journalist," continued Mr. Harrison, "who asked me why it was so many of the British telegraphists taken a keen interest in technical telegraphy. I pointed to the encouragement given to telegraphists by the British P.O. in the way of additional increments and the possible openings for the rank and file on the Engineer-in-Chief's staff."

Congratulations to Mr. A. Avery, whose paper read before the Telephone and Telegraph Society of London last session, has been translated and published *in extenso* in the pages of *Annales des Postes, Télégraphes, et Téléphones* Paris. *Les Annales* is the official journal of the French Telegraphs Administration.

Apologies are tendered for a couple of errors which slipped into last month's issue. For "six-triple," readers will doubtless have already interpreted "sextuple" in connexion with the Birmingham Portsmouth Baudot developments and in the Baudot article my friend the "comp." has again insisted that the rods of the governor are "grinding rods," I sincerely hope not! Please read "guiding."

Only a few weeks ago the lines were penned felicitating Mr. George Connell on the fact of having retired from the Telegraph Service to his Cornish home with, as it seemed, quite reasonable prospects of spending a few quiet and recuperative years away from the hurly-burly of official life. The new year had scarcely well-established itself when the sad news came announcing that our respected old friend had passed over. To his sorrowing wife and family our tenderest sympathy.

This sad note must still further be maintained in recording the loss of Mr. John Grant, retired, a much respected member of the supervising staff of the C.T.O. Mr. Grant was a man of no small talents and had been well associated with many of the C.T.O. activities, and those who knew his happy household will best realise the gap which his decease has left. It was a gracious service that Mr. Alec MacEwen rendered at the graveside by his oral tribute to an old and revered colleague.

From *All Things Considered* by G. K. Chesterton: "In the last resort all men talk by signs. To talk by statues is to talk by signs. Pillars, palaces, cathedrals, temples, pyramids, are an enormous dumb alphabet: as if some giant held up his fingers of stone. The most important things at the last are always said by signs, even if like the Cross of St. Paul's, they are signs in heaven." J.J.T.

LIFTING THE VEIL.

(From the "Post" of Dec. 17.

"WHAT is the place like; what is the man—or maybe the girl—like at the other end?" No one who has sat working at a wire hour after hour to an out-station can have failed to dwell on the notion. Nor alone will it have been the youth of our craft—flirtatiously inclined—whose thoughts have strayed in that direction; the older and the more sedate among us have all in turn felt at times that it would relieve the tedium or perhaps ease the stress of an uncomfortable hour if the "veil between" could be lifted. The impatience to which so many of us fall victim might in that way be averted; wrath with a struggling "crampist" or novice would perhaps give place to tolerance and sympathy could but a vision be vouchsafed.

The Baudot, and even the Creed, has not destroyed completely the human element in our relationship with the distant colleague; but human though that communion undoubtedly be, it has always seemed to be like that which exists between the blind. Who can question that advantage would follow upon the gift of sight? The notion lends itself to illimitable fancy! But the days even of practical tele-photography are not yet with us.

For all we know it was reflections such as these which led to a suggestion that the walls of our instrument galleries should be embellished with views of the towns with which the C.T.O. was in direct communication. The proposal at once found favour, and at the instance of the Controller a small committee had been set up representative of the staff and supervisors.

It is an essential part of the idea that the pictures shall occupy positions as nearly as possible in the vicinity of the circuits working to the respective towns. Not less desirable is it that the scheme shall be reciprocal, and that it shall be kept on a fraternal and non-official basis.

In due course, therefore, it is anticipated that copies of typical London views or scenes, subscribed for by the TS staff, will be presented to the offices taking part in the scheme.

It is not too soon to say that the efforts of the committee appear assured of considerable success. Already pictures from the staffs at Birmingham, Brighton, Bristol, Cardiff, Edinburgh, and Liverpool have been placed in position, whilst others from Bradford, Dover, Dundee, Exeter, Newmarket, Norwich, Salisbury, Tunbridge Wells, and Weymouth have been received. A number of other telegraph staffs have signified their willingness to co-operate. Up to the present as a general rule only those offices with a considerable staff have been invited to take part, but the Secretary of the Committee (Mr. Herbert Parker) is anxious that it should be understood that a picture will be welcomed from any office which would like to be represented.

One of the most pleasing incidents has been the gift of a valuable etching from a Scottish colleague who during his career, in peace and war, has been in close touch with TS men and wishes in this way to indicate the friendliness of his sentiments towards them.

It is not contemplated that the C.T.O. will become a second National Gallery. The necessary use of wall space for official announcements, electric fittings and instrument adjuncts prevents anything like symmetry in hanging the pictures; but already there is a noticeable reduction in the "workshop" element in our surroundings which is all to the good, and much appreciation is felt at the evidences of our provincial colleagues' goodwill.

In the early stages of the experiment it was found that some of the pictures received were too small to be effective as they were dwarfed by the size of the galleries, and the committee had to ask that in the event of the suggestion being favourably considered the pictures should not be less in size than 24 by 18 inches.

It may be added that the pictures are framed after their arrival at the C.T.O. as it is advisable to conform in some degree to a standard pattern, although in one case the donors made arrangements for framing and handing over direct. In every instance the frame bears a plate indicating by whom the picture was presented.

AUTOMATIC EXCHANGE FOR "LIVERPOOL COURIER."

On Jan. 16, Sir Wm. Noble, the Engineer-in-Chief of the Post Office, opened an automatic telephone exchange at the office of the *Liverpool Courier* connected with the public service and affording intercommunication with every apartment in the building. The system was installed by the Relay Automatic Telephone Company, and the whole of the operations are manipulated by means of a central switchboard to which each instrument is connected by twin wires only.

Mr. Burchill, the managing editor, who presided over a gathering of the representatives of municipal, commercial and newspaper interests and of the chief local Post Office Officials, said that if the Post Office was left free to work out its own salvation, and was only subjected to the right degree of wholesome pressure instead of venomous and vindictive criticism, it would by and by, attain the high ideal towards which, as they all knew, Sir William Noble and his colleagues were earnestly striving.

Mr. Burchill paid a whole-hearted tribute to the Liverpool Post Office engineers, who during the installation had been most assiduous and unremitting in their attention, and specially mentioned the invaluable co operation of Mr. Cornfoot, the sectional engineer.

In conclusion, he invited Sir William Noble to accept, as a memento of the occasion, a handsome silver inkstand, the centre of which consists of an automatic dial with which Sir William made the first call on the new system.

The
Telegraph and Telephone Journal.

PUBLISHED MONTHLY IN THE INTERESTS OF THE TELEGRAPH AND TELEPHONE SERVICE, UNDER THE PATRONAGE OF THE POSTMASTER-GENERAL.

Editing and Organising Committee - - - J. STUART JONES. JOHN LEE. J. J. TYRRELL. W. A. VALENTINE. J. W. WISSENDEN.

Managing Editor - - W. H. GUNSTON.

NOTICES.

As the object of the JOURNAL is the interchange of information on all subjects affecting the Telegraph and Telephone Service, the Managing Editor will be glad to consider contributions, and all communications together with photographs, diagrams, or other illustrations, should be addressed to him at G.P.O. North, London, E.C.1. The Managing Editor will not be responsible for any manuscripts which he finds himself unable to use, but he will take the utmost care to return such manuscripts as promptly as possible. Photographs illustrating accepted articles will be returned if desired.

VOL. VIII. FEBRUARY, 1922. No. 83.

THE WORLD'S TELEPHONES.

THE statistics which we publish in another column show that there were nearly 21,000,000 telephones in the world at the end of 1920 as against nineteen and a half millions the year before. The figures are, as our contributor explains, of a composite nature, and only those who have attempted the task can appreciate the difficulty of assembling telephone statistics of recent date. Some countries furnish figures up to March, some to June, some to December, and others none at all; in some countries the telephone is in such numerous hands that it is difficult to know how to reach all the companies concerned in its provision. Again, some countries show their development in the form of "lines" and others in the form of "stations" or telephones. All these figures need to be equated as far as possible, and recourse must be had to estimates for an earlier year where recent statistics are not available. It may be asked whether it is worth while to make such calculations and whether it would not be better to wait until absolutely official statistics for every place were obtained, even though they were five or six years old. The answer to that is that telephone statistics are not stable, like those referring to railway development, for instance. The mileage of railways—in Europe at least—shows little change from year to year, but telephone development proceeds at the rate of six per cent. and even higher. Even by now there are probably at least another million telephones in the world than our article records, and information relating to 1917 or 1918 would even if there had been no War, be utterly out of date. It has been possible this year to present a more reliable summary than we have been able to show on any previous occasion. Figures for Mexico, Central and South America—places where the operating companies are numerous—have been obtained by the kindness of Mr. V. M. Berthold of the American Telephone & Telegraph Co., and all the figures of the great telephone-using countries are official, so that only a small margin of conjectural estimate is required to round up the sum total.

The figures present no novel feature. The preponderance of North America in telephonic development is undiminished. In that continent are contained 14,355,000 of the 20,791,000 telephones in the world. The major portion of the balance is in Europe. The difficulty of obtaining information from any of the States formerly comprised in the Russian Empire (with the exception of Poland and Esthonia) makes the total for Europe a matter of conjecture to the extent of some 50,000 stations; 5,235,000 is a conservative figure, and we should not be surprised if there were 5,300,000 to 5,400,000 telephones in Europe at the end of 1920. There should of course be at least twice as many, even allowing for the fact that the non-industrial countries are never likely to possess a high telephone development. It is useless to expect any signs of overtaking America in the present year, nor do we think that (whatever rates may prevail in the future) the telephone will ever be considered such an urgent necessity by dwellers of all degrees in the ancient civilisations of Western and Central Europe as it has become to the Western World; but the telephone field in Europe is full of possibilities, and telephone men can only hope that when trade improves and questions of exchange are settled, a great forward movement in telephone expansion will begin.

HIC ET UBIQUE.

MR. ELLIS BARKER'S statistics and strictures, which we dealt with fully in our December issue, have overflowed from the *Quarterly* into sundry evening papers where, truth to tell, such "tendencious" stuff (to use Mr. Emil Davies' expression) is much more at home. One would gather from this article that if you want to get a five-dollar call free of charge in America, all you have to do is to ask for the husband if you want the wife (or *vice versa*). Then, (so Mr. Barker informs us), since "no charge is made if one can only speak to the wife" (and that could easily be arranged), you can enjoy "free speech" in the most literal sense.

AN official return gives the following statistics for Poland:—

Administrative District.	No. of Telephones
Bydgoszcz (part of Posen province) ...	8,357
Gdansk (formerly West Prussia) ...	5,383
Grodno	—
Krakow (Cracow)	8,093
Lublin	1,356
Lwow (Lemberg)	3,510
Poznan (Posen)	16,936
Warszawa (Warsaw)	3,815
	47,450

The figure of 3,815 for the Warsaw administrative district does not include the telephones (some 23,000) in the City of Warsaw which are worked by a Swedish Company.

A CORRESPONDENT has sent us a translation of an open letter to the *British Esperantist* from M. Modenov, Central League Committee, Cudovsky, 6, Moscow, to the effect that the Postal Telegraph, Telephone and Wireless Telegraph officials in a combination of separate societies, desiring to start reciprocal communication with all colleagues in like services throughout the world, decided at their all-Russian Congress to study the Esperanto language for the purpose of interchanging by its help, our thoughts.

"The time is soon coming when Russian officers of the League will be able to initiate and carry on friendly correspondence with you, and by this means we might progress on a mutual base—a common interest. But in order that we may effect this, friends, you must help us—you must inform us to what grade you belong in the "Esperanto" movement of your land—how your professional leagues are arranged, and particularly you must let us have addresses of all Esperantists of the league which will be printed in our journal. We desire to have your journals and gazettes of your societies and Esperantist gazettes, and also we would like photos of your groups in exchange for ours."

The societies in Russia number 185,000 members. They desire similar information from England.

THE *Manchester Guardian*, commenting on Dr. Fleming's recent lecture, says: "The telephone is not and never was an ideal creature. It has its shibboleths like the Ephraimites at the fords of the Jordan; it cannot pronounce 's' properly, and tends to make 'f' sound like 'n' . . . and in addition it has some special trump cards of malevolence that it rarely gets the chance to play. The waves passing over a long-distance wire get tired of their job, which is perhaps not surprising. Unfortunately in this long-distance work they do not get all tired at the same rate: some stay the course better than others. It is therefore possible for the faster waves to overtake the slower, 'so that the notes of a tune like "God Save the King" might possibly arrive at the other end of a long wire in the wrong order.' This is a terrible warning against misguided vocalism down a long-distance telephone. What is too silly to be said may be sung—but not through an instrument of this sort."

As we read these instructive lines there recurred to us the memory of some of those facile jokes about the telephone and the telephone service which flow in a never ending stream through our comic dailies and weeklies. If they could be sung into a telephone over a wire of interminable length, perhaps they might edify and amuse the stranger at the distant end—but only if they reached him in sufficiently inverted order.

A WRITER in the *Irish Independent* seasons some excellent "advice to the novice" with considerable wit.

Most people, he says, approach a 'phone for the first time convinced that there is a catch somewhere. A blurred memory of an electric shocking coil in early youth and a fear that when they put in "the other penny" there will be no chocolate left, and the station-master won't have a key, unnerves them from the start.

The first thing to remember is that Bell or Edison (according to taste and nationality) invented the 'phone—Sandow had absolutely nothing to do with it. The little handle at the side is intended to attract the operator, not distract her, and certainly not for developing the muscles. Again, the idea that yelling down the receiver gets any farther than all round the office and next door is erroneous. The voice travels better when the speaker speaks quietly.

When the operator puts you through, don't jangle the bracket and curse or give an impersonation of a watchdog on a short chain. You are now at the mercy of your fellow-subscriber. If you ring again, the exchange girl, being a lady and not inquisitive (she doesn't know you, anyhow, and has 49 other plugs to mind) will take it that you are ringing off. Then you are where you started, minus tuppence and temper. You ring again and get the exchange, and so on.

* * * *

Have a heart for the girl who sows plugs all day and reaps harsh words. The only variety she ever gets is when she alters her voice and manner and pretends she is the supervisor. She is a telephonist, not a telepathist. If you don't give the correct number she can't read your mind: or know you are trying to get on when you ring off. If she were a thought-reader she'd be on the halls. If she told you her mind she'd be fired.

The Post Office is a British Government department, and, therefore, responsible to nobody, but it is polite. It says, "You may telephone from here." It might say, "Why should you telephone from here?" or "How dare you telephone from here?" or just "Certainly not," but it says you may, and you may; perhaps, people have—think of Bruce and the Spider. Anyhow, be polite to the Exchange girl. When you are rude you hurt her to the quick. Oh, yes, indeed, she has—you are thinking of Post Office telegraphs.

We feel sure our humorous critic would agree that the moving apologue of Bruce and the Spider would apply even more suitably to the telephone joke-repeater than to the telephone caller. He does try!

THE NIGHT TELEPHONE SERVICE AND SOME OF ITS PROBLEMS.*

BY E. J. LANSBURY (LONDON TELEPHONE SERVICE).

IT may appear from a cursory reflection on the title of "The Night Telephone Service and some of its problems," a little difficult to establish the case that problems do exist apart from the service as a whole; but yet, a closer examination will reveal certain features that are conditioned by and peculiar to a night service. As one views the telephone system it has a twofold function; firstly to cater for what may be termed the purely utilitarian needs; secondly, to render service in the purely social sense. This might sound paradoxical because both features are utilitarian, but one is desirous of drawing a distinction between traffic arising from ordinary commerce and traffic which is solely of social use, or service apart altogether from a commercial value.

Critics of the telephone system take little or no account of the latter feature. Seldom has the service been credited with its full usefulness; mainly its standard of value is regarded solely from its return of money profit, and whilst some regard for this aspect is needful, yet it is not all important. In theory and practice the purely service aspect is accepted by critics. It could not be otherwise. It is only disregarded because it is convenient to do so and the principle never in jeopardy, and if such a retrogression were possible as the closing-down of the night service, the line of defence for its retention would be its social usefulness, and doubtless the loudest critics of to-day would assist most assiduously in the campaign.

The night service more than the day emphasises the purely service aspect of the institution of telephony. As the night wears on, it becomes clearly defined, and, according to the purpose which prompts its use, the telephone, becomes invaluable in terms of money's worth. It may be for fire, police, or doctor, and upon these demands during the stillness of the night, when the normal means of daily contact are suspended or limited in scope, the telephone is rendered incomparable with the usually accepted standard of value. When meeting such needs as these, the night telephonist loses his individuality as a mere telephonist. In the wider sphere of rendering a social service, he finds himself functioning in the highest degree of citizenship.

It appears most likely that the service aspect of the night system will remain. It may vary in degree, but all the portents point to the limitation of night industry as far as is possible. Bearing this in mind, it is apparent the problems to be met are of a different nature from those arising from the day organisation.

The first problem that comes to mind, and perhaps the most important because others are subsidiary, is the acceptance as a principle that night telephony is mainly a social service, and because of this its return of revenue must be subservient to its social value. This principle once accepted should determine many of the night staff problems. It would at least determine the fundamental issue upon which conditions and remuneration are based.

Perhaps at this moment it would be well to examine in detail the peculiar circumstances of the night traffic. Firstly, the mode of procedure in operating night traffic has not been dictated, but rather it has developed. It has, of course, its connexion with the system found most suitable for dealing with day traffic, but its rigid application is not possible or desirable, and in the circumstances there is a variation in practice. On receiving calls, for example, the day practice is to deal with each one at a time, and give careful supervision to them, but it has proved convenient and efficient at night to deal with two or more simultaneously, and even then for the operator to leave the position for another one, and repeat the same operation.

In such circumstances it must be obvious that the minute and careful supervision of calls is not possible, and yet it is correct to say that in the main efficiency does not suffer because the telephonist becomes adapted to the condition and knows what is required of him. Again, the system in operation at exchanges with subscribers' multiples is for a scout to watch the whole switchboard for calling signals, and then to call the number for any telephonist who may to pick up the call and see it through. The only

* A paper read before the Telephone and Telegraph Society of London, on Dec. 19.

Digitized by Google

way to apply the standard procedure would be to employ a much greater force than at present to cover the switchboard. Experience has shown such a course is not warranted, but the variation in practice suitably meets the condition. Perhaps the outstanding feature of the night service is the adaptability of the night telephonist. To give of his best he requires initiative and alertness, and these he acquires by experience. Now there are times when the night telephonist has to determine which of two or more calling subscribers shall receive first attention, and, because of his knowledge of the traffic, his decision is usually accurate. A night telephonist knows his callers, and it is precisely the regular callers, calling at regular periods that ensure prompt attention for the unusual caller, and therefore delay on urgent calls does not arise. The unusual calls in the late night or early morning are invariably due to emergencies.

In nearly all exchanges there are certain regular calls at regular periods, the most common examples are, L.G.O. Company branch garages calling up headquarters to give statistics and records, night guards such as at banks ringing round a circuit to ensure all is well at various branches, police stations also ringing round a circuit to give various instructions, &c. Whilst on this latter point we might here note a very convenient and efficient variation in practice, When it is desired to pass an important and urgent message, say to a dozen areas, usually the caller will say his call is important, and ask to be connected simultaneously. Then the communications are established on one position, the keys thrown over, and all areas can be spoken with as desired. Such procedure is not possible during the day, unless, of course, special provision is made, Further, the procedure is not provided for in standard rules, but it is indeed useful and efficient in practice.

To summarise, the main features of the night service are regularity of traffic at regular periods. By instinct these calls are known, hence when unfamiliar calls are made (and mainly these would be due to emergencies), the question of delay does not arise. The adaptability of the night telephonist to exchange conditions consequently assures prompt and efficient service. There is one other important point which can only be fully appreciated by actual experience, and it is the sympathetic understanding of the calling at night tending towards a tolerance which makes for smooth working. So far we have dealt with the special traffic conditions, and the consequent arrangements to meet them. The relation of the night telephonist to the service as a whole, and his contribution to a general efficiency of the service has now to be spoken of. At night the whole of the exchange equipment and apparatus is tested, and from the point of view of general efficiency such a test is invaluable. The conditions obtaining at night, namely, a big decrease in the volume of traffic renders a complete test comparatively easy, but yet on a thorough overhauling depend most of the factors that make for a good service. Inefficiency due to mechanical faults is lessened, faulty cords, no glows, and faulty ringings are detected, and in most instances all can be adjusted before the high-pressure peaks again come around. It is quite common to pass to the engineers a veritable crop of exchange faults.

The testing of register keys is regarded as most important. The percentage of over—and undercharges, must be a matter of serious concern, and complete accuracy at least in this connexion is a matter of vital importance. This system of exchange testing is known as routine testing. The name is probably best suited in all the circumstances, but it does not convey its very great importance. The measure of its value may be difficult to express, but without doubt this contribution by the night telephonist to the sum total of exchange working and efficiency will always remain vital, but yet obscure.

At this point a glance at the night telephonist from the personal or human point of view might be useful. We find him a person mainly in obscurity rendering service, and aiding in the maintenance of a vital organisation. By the nature of his work he is cut off from the normal mode of life known to others functioning within the organisation ; of necessity he accepts all the disadvantages which inevitably follow. At the moment the basis of his contribution to the organisation is not clearly defined ; his rendering of social service is not accepted as such, nor is his contribution in other aspects fully valued. He acutely feels his disadvantages and has shown in spite of his difficulties he can prove himself capable and fitted when opportunity presents itself, and he is always glad to be relieved from the incidence of an irksome calling. Occasionally he comes into his own, and ultimately his status is assured. The one outstanding feature of the night telephonist is his isolation. The result is loss of personal touch between him and those who should have a personal knowledge of him. The disadvantage may be a loss to the individual and the service. The difficulties of administration are doubtless appreciated by all concerned. They may by variation or organisation and administration at least be toned down, but the purely human element is not so much a question of organisation as it is the acceptance of certain principles and the consequent implications.

Organisation.—One is not assured that the present method of organisation is most suitably adapted to meet the circumstances of the night service, and whilst the merits and demerits of centralisation and decentralisation could be argued for many hours, the fundamental fact which should determine the principle or expediency in this instance is the peculiar circumstances attaching to the night service.

The one needful effort necessary for the night service administration is a comprehensive system that will abolish its present irksome isolation and give it life and scope, and give opportunity for full expression of individuality, and so make the individual feel, that after all he is really more than an adaptable part of the mechanism. It will further ease the difficulties that must of necessity be many, consequent upon a day staff organising arrangements for a night service.

The present system might usefully be amended, because it is awkward and tends toward duplication. The justification for variation in procedure is produced by the variation of all essential factors in the telephone system. Actually there is no line of demarcation between the day and night administration, so far as it is concerned. The responsibility is centred in the chief of each district area, and the same machinery is intended for both day and night services.

Apparently it is recognised that the system leaves something to be desired. An effort has been made to meet it, for side by side with the traffic district control there exists the night Superintendent's office. Yet neither meets the essential need. Virtual district control is not possible under the system, and a system whereby many people have control from a night Superintendent's office for periods of short duration likewise leaves much to be desired. From the point of view of economy, efficiency and regard for the staff, the centralised system of control with a permanent night personnel can best be adapted to the night-service. It would ensure the specialisation which the special circumstances need. There might also be added to the night organisation the training of the night staff ; at the moment it is trained apart from the normal environment. The night telephonist receiving instruction from the day schools becomes acquainted with the apparatus and telephone nomenclature, but that is all. He receives his training at the exchange switchboard, where he learns the reality and becomes adapted.

It will not be doubted that the real secret of efficiency lies in solving the human problen. Therefore, the aim should be to encourage the fullest measure of co-operation, but real co-operation implies a widening of the Whitley constitution, so that staff representatives can function more usefully than in an advisory capacity. An extension of Whitleyism in this direction would be but a recognition of the new outlook on the State and social service that has developed, and is in the process of shaping itself into concrete form. Meanwhile, the basic principle of the institution of night telephony needs to be defined. Shall we accept its function to be rendering of social service and accept the consequent implications ? If so, the problem of administration from the consumer's point of view and likewise those engaged in its maintenance will be easy of handling. Then what are considered problems to-day will pass ; they may be remembered historically, and that is all.

REVIEWS.

"Directive Wireless Telegraphy. Direction and Position Finding, &c. By L. H. Walter, M.A., A.M.I.E.E. Published by Sir Isaac Pitman & Sons, Ltd. xii + 124 *pages. Price* 2*s.* 6*d. net.*

During recent years various methods have been devised for directing the waves used in wireless telegraphy along a definite line, and, at a receiving station for detecting the direction whence the waves are received. The methods used at a receiving station to detect the position of a transmitting station are of particular importance. Not only do these methods enable navigators to find their way in foggy weather, by taking the bearings of known wireless stations in the same manner that the bearing of a lighthouse is taken by optical means, but they also enable the signals from a nearby transmitting station to be cut out at a receiving station, and thus enable duplex working to be carried out.

The ordinary text books on wireless telegraphy do not deal very fully with the subject of directional working, and in view of the importance of the subject the appearance of a book dealing solely with this question will be welcomed. The first chapter deals with the general problem of directional wireless telegraphy. The various methods used, both for directional transmission and reception, are described in the second chapter, together with a summary of the formulæ bearing on transmission and reception with loop aerials, and hints on the design of these aerials. The application of directional working to practical navigation is dealt with in the next chapter, and the fourth is devoted to a description of the various types of direction finding apparatus in use at present. The final chapters give a short account of the wireless stations fitted with directional apparatus which are now in operation, and of various other applications of directional working, including those which aim at the prevention of interference by atmospherics.

The book is well got up, and the illustrations are excellent. It will certainly be found of great assistance to anyone who is in any way brought into touch with wireless matters.

"Rays of Positive Electricity and their Application to Chemical Analyses." By Sir J. J. Thomson, O.M., F.R.S. Published by Longmans, Green & Co., 39, Paternoster Row, London. Second Edition. 237 pages. Price 16s. net.

Everyone who is connected with present day telegraphy or telephony is more or less familiar with electrons and their properties, as exemplified by the thermionic valves used as generators and detectors of electro-magnetic waves, and as relays on cable circuits and on long-distance telephone lines. These electrons are negatively charged. Experiments with vacuum tubes have, however, also revealed the existence of positively charged particles, consisting of atoms from which one or more electrons have been removed, and it is streams of these positive ions, as they are called, which constitute the positive rays, or "canal rays," so called from the fact that they were originally detected streaming backwards through a hole or "canal" made in the cathode of a vacuum tube.

A large amount of research work has been carried out on these rays. Although the results obtained so far do not bear very directly on telegraph engineering matters, they have received very important applications in the determination of the chemical constitution of bodies and of the structure of atoms and molecules, and at least a superficial acquaintance with these results should be possessed by anyone who wishes to keep up-to-date with scientific developments. It should also be borne in mind that phenomena which, when discovered, appeared to be solely of academic interest, have over and over again received very important practical applications, so that it is advisable that no advance in pure science should be neglected by the practical man. The case of the cathode rays, discovered by Crookes, and their application in thermo-electric valves, is, of course, an outstanding example.

The book under review is one which should be read by anyone wishing to keep abreast of modern progress in these matters. Sir J. J. Thomson is well known as the leading authority on these matters, and there is no need to analyse the book in detail. The subject matter has been brought up-to-date, and no great amount of previous mathematical and physical knowledge is required by the reader in order to follow its presentation. Of course, it is not an elementary book, but anyone with the fundamental knowledge required to deal with telegraph and telephone engineering problems should have no difficulty in reading it.

The book is well printed, the diagrams are good, and the plates showing the photographic results of various experiments are very clear.

"The Practical Electricians' Pocket-Book and Diary, 1922." S. Rentell & Co., Ltd. 3s. net.

This, the 24th issue of this well known and useful little work has been thoroughly revised and brought up-to-date—in fact, several sections have been entirely re-written. New chapters have been added on the motor converter, railway signalling, electricity in motor vehicles, &c. The 560 pages are packed with information of utility to electrical engineers of all kinds.

"Sindri." Reykjatik. Nos. III and IV.

We have before referred to this periodical, which is published quarterly by an Icelandic society. No. IV gives particulars of 15 years' growth of the Icelandic telegraph and telephone system, which has increased from 616 km. to 2,420 km. (pole route) and from 1,241 km. to over 7,000 km. (length of wire) in that period.

THE BAUDOT.—XXIX.

By J. J. T.

THE care of the receiver will now receive our attention. Each armature E (Fig. LXXVII) should move freely on its hinge at H and the brass antagonistic split flat spring M should be given sufficient tension to throw its armature sharply upwards to its limiting stop B. In quadruple single plate and sextuples of any type this tension may need to be increased for obvious reasons. All armatures should normally be the same distance from their respective coils, *i.e.*, should be in the same horizontal plane. The play of each armature is adjusted by the notched screw J. The

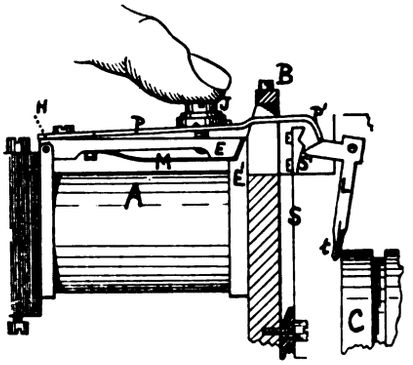

FIG. LXXVI.

lip of each appendix is adjusted before the receiver leaves the factory or workshop at a distance of about 2 millimetres from its corresponding lever L. Should it be necessary, however, it *may* be gently bent either nearer to or farther from the horizontal portion of the same. This necessity should be rare. When the appendix lip P^1 is depressed by the action of the armature E the former should follow L downwards in its course but not with sufficient force to press the lower portion *t* unduly against the edge of the combiner wheel C. To adjust this, stop the receiver at the point where the shuttle cam has just completed the replacement of the appendix levers; then with the finger (Fig. LXXVI) press J firmly

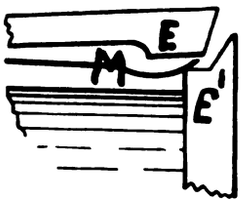

FIG. LXXVII.

so that L rests against the edge of C. In that position there should be (1) no play between the lip P^1 and the horizontal portion of L, and (2) no feeling of flexibility whatever pressure may be exerted upon J. To obtain this necessary condition, the screw J should be adjusted. If, however, as will sometimes happen, there is no possibility of obtaining both conditions, it is better to have a little play between L and the appendix lip P^1 than to have any flexion of the appendix itself.

The antagonistic brass spring is as is already known split into two forks. One only is actually needed as a spring, the other serves to prevent the effects of retentivity in the extended pole-

Digitized by Google

piece E^1 unduly acting upon the armature E. The correct adjustment is, therefore, that one of the forks of the spring M should be bent slightly lower than the other. The free ends of M should extend right up to the end of the undercut portion of E^1 and on no account should they be bent as shown in Fig. LXXVII.

(To be continued.)

CORRESPONDENCE.

SOME MORE NOTES ON SYNCHRONISM.

TO THE EDITOR OF THE "TELEGRAPH AND TELEPHONE JOURNAL."

Sir,—In your December issue you published an article by Mr. J. W. Teare, which by implication gives the credit for the invention of synchronism generated from the message signals to the designers of the Western Electric multiplex. To anyone not acquainted with the facts, Mr. Teare's article would give the impression that this method of correction is a special and exclusive feature of the Western Electric. Such an impression would not only be erroneous but also unjust to other inventors and systems. I must, therefore, ask you to allow me to present your readers with some additional facts which will synchronise Mr. Teare's article with the true position.

Probably the first printing telegraph to correct from the message signals in the modern sense was the Hughes. Of the modern high-capacity systems the Murray automatic printing telegraph was, to the best of my knowledge, the first to use this plan. It was followed by the Creed automatic reperforator, in which this method of correction also appears.

In 1903 when I began to realise the advantages to be gained by a combination of the Murray automatic and the Baudot multiplex, I prepared a paper with illustrations and diagrams describing such a combined system, which embodied all the essential features of the present Murray multiplex. It was a multiplex with perforated tape transmission and automatic transmitters for each channel, and it was provided with the automatic start and stop for the transmitters, invisible correction of errors and other devices employed in the Murray multiplex and since copied by other multiplex systems. It also provided for correction from the message signals. I sent copies of that paper in confidence to the British, French and several other telegraph administrations in 1903. Several years afterwards, the French telegraph engineer Pierre Picard applied this idea of correction from the message signals to the Baudot multiplex in a different way from the plan I had proposed. The Picard plan has been in successful use for many years across the Mediterranean between Marseilles and Algiers, and it is fully described in the French textbooks on the Baudot. It is the Picard arrangement that has been adopted without acknowledgment in the Western Electric multiplex, and I am glad to take this opportunity of expressing my opinion that it is very unfair not to give Pierre Picard credit for his most ingenious application to the multiplex of the principle of correction from the message signals.

The Picard arrangement can be applied to any multiplex system, and it is in no sense a speciality of the Western Electric. In the Murray automatic system correction from the message signals was carried out in a simple way without any extra apparatus. The same remarks applies to the Creed automatic; but in the case of the multiplex such simplicity is not possible, and both in the arrangement I proposed in 1903, and in the Picard plan as used by the French Administration and by the Western Union and Western Electric multiplex, a good deal of extra apparatus is required. This extra apparatus is certainly not worth while in the case of the large number of circuits where the line speed is above the traffic requirements. In the case of underground cables where there is pressure of traffic up to the limit of carrying capacity, and where what we might call the law of diminishing returns begins to operate, then of course the Picard scheme for more intensive cultivation of the telegraph crop can be applied with advantage on any multiplex system, and I have no doubt that the British Post Office Engineering Department will apply the Picard arrangement on some of the British inland Baudot circuits when the need arises. Certainly on the Murray multiplex I advise the use of the Picard arrangement whenever it can be profitably employed, but not otherwise. The French Administration evidently works on the same plan, in most cases preferring the simpler and automatic Baudot method.

I must also dispute Mr. Teare's contention that the Western Electric synchronism is superior to that of the Baudot. Such a claim will certainly make the French Baudot experts smile. Here again I may point out that the Western Electric has no monopoly in fine synchronism, because the synchronism of any multiplex system can be refined to any desired degree, certainly beyond any ordinary requirements. I happen to know that some experiments are being conducted (not by me) in which refinements of synchronism much superior to anything hitherto attempted are being used. In this case special requirements render such refinement desirable, but for all ordinary work synchronism equal to that privided by the Baudot multiplex is amply good enough. The addition of the phonic motor drive to the Baudot method of correction is valuable not for the finer synchronism that is possible with such an arrangement, but because of its greater simplicity, much reduced maintenance cost, and easy change of speed within a range from 20 to 70 words a minute per channel. I know by experience that, with the phonic motor drive and the Baudot method of correction, synchronism ceases to be a multiplex trouble, and it is being widely adopted by the Telegraph Administrations because it gives multiplex without tears.

Dec. 19, 1921. DONALD MURRAY.

TO THE EDITOR OF THE "TELEGRAPH AND TELEPHONE JOURNAL."

DEAR SIR.—As criticism of the standard expression: "They will probably call you again, will you please replace your receiver" is suggested under the London Telephone Service Notes in the January issue of the T. & T. JOURNAL, I should like to give the views of myself and the other telephonists in this exchange.

1. The expression is certainly explicit from our point of view, but from our experience it is never grasped at once by a subscriber, and finally, after repeating several times without effect, the telephonist, in desperation, uses her own words such as: "They'll ring you again if they want you: put your receiver back please." The subscriber then, as a general rule, gives a grunt of comprehension and does as he is asked.

2. The P's. L's. and S's. are inclined to trip the telephonist up and the word replace develops into replaish which somewhat suggests the "morning after the night before."

Standard expressions are essential, but they should be made up of short, every-day words that can be grasped at once by any subscriber or caller whether conversant with the use of the telephone or not.

For instance, the expression "Have they answered?" sounds much better than "Have you got them?" but the usual reply to the former is "No! I'm waiting, don't take me off," while the latter is understood at once.

Z. F. RICH,
Supervising Telephonist.

P.O. Telephones, Llandudno.

WIRELESS EXHIBITION AT EDINBURGH.

AN interesting and rather unique exhibition of telegraph and telephone apparatus as applied to radio activity was held in Edinburgh on Dec. 17, under the auspices of the local Radio Society, which is affiliated to the Wireless Society of London.

The object of the demonstration was to bring under the notice of the public the practical research work carried on by the Society, and to give those interested in wireless transmission of intelligence an opportunity of seeing specimen receiving and transmitting sets in actual use. The Society is composed of a number of enthusiasts in the science of "wireless" who reside in the district, and who meet together at weekly gatherings, at which they have a series of lectures and demonstrations. The local president of the Society explained at the outset that the apparatus on view was of the most simple kind, as the members did not wish it to be thought that it was essential to employ complicated instruments for the class of work to which they were devoted. The membership consisted of those who had had experience and those who had not, and the knowledge of the experienced was at the disposal of the inexperienced.

Nine-tenths of the material of the exhibition was entirely h ome-made, and the fact that they were able to make so great a use of it showed how efficient was the work of the Society. One receiving set had been made at a cost of 17*s.* 6*d.*, and it could receive messages extending over a distance of 1,500 miles. The hobby, therefore, was not a costly one, and it gave astonishing results for very little labour. In the afternoons they got the latest news from the Eiffel Tower, while in the mornings they got Berlin, and on Sundays they got a concert at The Hague which could be distinctly heard in Edinburgh.

The exhibition was opened by Sir J. Alfred Ewing. F.R.S., the Principal of Edinburgh University, formerly and successively Professor of Engineering at Tokio, Dundee, and Cambridge, and author of of many publications of world-wide reputation including the standard work on Magnetic Induction in Iron and other metals.

During the War it was Dr. Ewing's privilege to be the "official eavesdropper" and he had organised the office in which continuous reception was maintained, night and day, of all wireless signals it was useful to overhear. There were many secrets in the archives of the office—secrets which would not be revealed in the lifetime of anyone who took part in the War. He did not give away any of those secrets, but he would say that wireless was an enormous advantage to this country for the purpose of defence, apart from its other use as a means of giving orders to the ships. With the vast improvement upon the early receiving apparatus, in which crystals were used where they now had valves, it became possible to hear almost every whisper that was occurring in the North Sea and they developed an exceeding efficient system of directional wireless. If a Zeppelin crossing the North Sea made a wireless signal, before many minutes had elapsed, the position of the airship was plotted on a chart and we knew exactly where that ship was. We got our directional system perfected before the Germans, and when a Zeppelin would signal asking her own side to tell her where she was we would hear it, although we knew the locality already. The staff became so expert that they could recognise the very "accent" of a sender. It was part of the game of

Digitized by Google

war to change the call signals of ships from time to time, and it was very important for them to know when the Germans changed theirs, and to locate which ship a particular signal belonged.

The opening ceremony was attended by a very large number of the public who were afterwards given demonstrations in telephony and telepraphy by the various exhibitors. Among others visiting the show were Mr. Taylor, Superintending Engineer, and several of his assistants. Major Jayne, Controller of Telegraphs, Dr. Douglas, Medical Officer, and several members of the Secretarial and Accountants Departments.

The writer of these notes was particularly interested in the function, as he was probably the first to write a popular article on wireless telegraphy for that same somewhat elusive individual commonly known as "the man in the street." At that time treatises on radio telegraphy were confined to the scientific or technical press, excepting when some astounding paragraph appeared in the evening or Sunday papers telling of some marvellous achievement that had either taken place or that was about to be realised.

Preece created some interest in the subject by his experiments across stretches of water, but his system was merely a development of that originally demonstrated by Rowland Lindsay of Dundee. It may not be known to many readers that the old Electric Telegraph Coy. actually tried a wireless system devised by one Howarth, but they evidently had not harboured "great expectations" from it, as in their appeal against the compulsory purchase of the telegraphs by the State they apologetically referred to this incident as being due to an excess of that zealous and progressive spirit which they claimed to have animated them in all their transactions.

The first really practical step from Maxwell's mathematical deductions was made by Hertz when he caught the wave in the form of a spark at an air gap in a metallic hoop. This clearly demonstrated the accuracy of Maxwell's theory, but it was a long way removed from accomplishing a wireless telegraph system. By the introduction of the coherer of Branley, Lodge and others, the next move was made towards successful telegraphy, and all subsequent development has been in the direction of securing greater sensitiveness in that part of the installation which was represented by the original coherer of Branly and in providing means for transmitting waves to a greater distance. The remarkable progress made may be realised when it is remembered that in 1896 the greatest distance over which signals could be transmitted was under two miles. In the year following this distance had been increased to 18 miles, and to 85 miles within a couple more years, while in 1901 it reached 1,800 miles when Marconi achieved the feat of transmitting messages across the Atlantic. The year 1910 saw from 4,000 to nearly 7,000 miles covered, and towards the end of last year communication was wirelessly established with New Zealand, or half way round the Globe.

The comparatively recent development of wireless by the Marconi Company, whereby telephonic communication was carried on by cable to Southwold, thence by wireless to Landvoort, and then by wire to Amsterdam, is only slightly less marvellous than the recorded instance of a man in Kansas, equipped with an amateur's outfit, sending out by wireless a gramophone record of "Humoreske," which was transmitted 1,500 miles to the coast and thence across the Atlantic to Scotland where it was distinctly heard. It may be truly said that few romances can boast of more fascinating pages than the history of wireless telegraphy.

PRESENTATION TO MR. W. J. PARSONS.

LLANDUDNO.

Mr. W. J. Parsons of the P.O. Engineering Dept., retired on Dec. 31, 1921, after 30 years' service with the N.T.C. and P.O.E.D.

The second annual social evening of the Llandudno and district telephone staff was held on Jan. 2 at Paynes' Cafe, and during the evening, Mr. J. Dickson, Sectional Engineer, presented Mr. Parsons with a gold watch, suitably inscribed from his colleagues past and present, and Mrs. Parsons with a pair of silver vases.

Members of the Traffic, Engineering and Operating staffs were present from Chester, Colwyn, Bay, Conway Bangor, Denbigh, Deganny, Llanrust, Llanfairfechan, Penmaenmaur, Partmadoc and Rhyl, and several testified as to the esteem in which Mr. Parsons had always been held. Letters were received from numerous friends, who were unable to be present, including Mr. J. G. Ferguson, Traffic Superintendent, Sheffield, and Miss Parry, Supervisor, Chester. The Postmaster, Mr. W. W. Young, his wife, and several members of the P.O. staff were present.

Musical items were given by Miss Hilda Parsons, Messrs. J. A. Robinson, R. G. Chambers and Clem. Brown, the accompanists being Misses Parson and Thomas and Mr. E. E. Hughes.

Prize winners in the competition games were as follows: -

Progressive Games: Mrs. J. Dickson and Mr. J. Parsons. *Blindfold Donkey Drawing*: Miss G. Thomas. *Hat Trimming*: Messrs. J. Parsons and Wilson. *Jumbles*: Miss Parton. *Stump Speech*: "Paint and Powder," Miss D. Doré; "Should Women Smoke," Mr. A. Bellis.

The arrangements were in the hands of Misses Kennerley, Jones and Rich, and Messrs. Willet, Owen and Williams.

LONDON ENGINEERING DISTRICT NOTES.

Telegraph Mechanical Aids.

THE use of mechanical aids in telegraph working viewed from the standpoint of a traffic officer, was the subject of a paper read by Mr. J. Stuart Jones before the London Centre of the Institution of Post Office Electrical Engineers on Dec. 14. The author described some of the features of mechanical aids at present employed and indicated some of the advantages and disadvantages.

The subject was divided broadly into three parts:--

(1) The reception of a telegraph message over the counter and its carriage to the instrument table.

(2) Alternative means of transmitting a telegram.

(3) The method of delivery.

As was to be expected a paper of this character read by such a well-known traffic officer before an audience composed almost entirely of engineers, provoked a keen discussion. Mr. Lack contended that a statement of the author to the effect that "there had been no notable change in the machinery of the service since the Telegraph Transfer of 1870," did not correctly represent the facts. He stated that while it may have been perfectly true that the administration had not used mechanical aids to the extent that it might have done, it was not because full details of possible and practical application of machine methods had not been supplied by the Post Office Engineering Department. He claimed that no inventor had ever brought a new invention to the notice of the Engineering Department without receiving sympathetic consideration, and, if there was any real promise in the apparatus, the advantage of a practical trial. Details of the results were furnished to the administration. A long list of actual cases was given to substantiate this claim. Moreover, it was stated that in practically every case the inventors' original idea had been improved and developed by Post Office Engineers, and the inventors themselves were the first to acknowledge this. Although the inland telegraph authorities were slow to take advantage of these investigations and recommendations, the foreign countries with whom Great Britain was connected telegraphically were fortunately ready to co-operate, with the result that British Engineers were able to instal, watch and improve various types of machine telegraphs. When, therefore, the attitude of the British authorities changed, and apparatus of similar type was required for inland working, the spade work had been done and no delay was incurred in the Engineering Department.

Mr. Lack also stated that the premier position attained by Great Britain in the investigation of machine telegraph working prior to the War was admitted by other countries and when America awoke to the fact that there was a great future for machine methods, it was to the Post Office Engineering department that she turned in order to get an expert. As competitive companies exist in America, while in England a monopoly prevails, this fact disproved the statement of Mr. Stuart Jones that a monopoly necessarily tended to stifle progress.

Another speaker drew attention to the large number of inventions introduced by Post Office Engineers, and humorously remarked that the difference consisted in the fact that the commercial inventor had his name tacked on to the invention and received the reward of his labour.

One speaker, well-known to telegraph officers, was understood to say that his qualification for being in the Engineering department was that as a telegraphist he had developed telegraphists' cramp and was about to be put on the scrap heap when, fortunately, a transfer was managed. For the benefit of those telegraphists who since the meeting have developed a pain in the thumb it may be as well to say that there are other necessary qualifications. Altogether the meeting was stimulating and helpful, and although the audience was smaller than usual, there is no doubt that everyone present echoed Mr. Weaver's well chosen words of thanks to Mr. Stuart Jones.

Unit Costs.—In all well organised undertakings some system of costing is in use. Naturally the nature of the business determines the simplicity or complexity of the system. The ultimate object is, of course, to enable the managerial staff to control expenditure and regulate the prices of the commodities dealt with.

In some businesses the requirements are met in a simple manner by equating large blocks of expenditure to some units applicable to the particular cases. Examples of this, in the case of the telephone business, are found in such statistics as figures of operating costs per originating call, and the total cost of maintenance per station. In the case of a manufactured article involving a series of operations, it is frequently considered advisable to obtain information regarding the cost of each operation. The supply of telephone plant lends itself to analysis on these lines.

The work involved in the provision of the external plant, the exchange equipment and the subscribers' apparatus, covers a multitude of separate

Digitized by Google

operations, each of which is repeated over and over again. It is clearly advantageous to know how long each individual operation takes. Such information can be used for estimating purposes and for comparative purposes with the object of setting up healthy rivalry between sections. It is obviously necessary for comparison purposes to eliminate from the returns factors beyond the control of those engaged in the operations—travelling time, for instance.

The Engineering department of the Post Office has a system in operation known as the Unit Construction Cost System from which it is hoped in the course of time to obtain some very valuable information.

The various items of work are scheduled, a number being given to each. Progress reports are prepared daily by the men, or in certain cases by the foremen, each item of work being debited with the time spent thereon. The reports are summarised in the Superintending Engineer's Office by the same staff that prepares the pay-sheets. The value of the statistics obtained is, of course, dependent on the care taken in drawing up the daily reports. Special steps are taken to see that all concerned fully understand the objects of the system, and that the information submitted is reliable.

Pneumatic Tubes.—Captain J. Coxon in a lecture given on Jan. 11 to the Institution of Post Office Electrical Engineers, dealt with a phase of the Engineering department's work that is not such a prominent feature as many others dealt with in addresses to this Institution.

The pneumatic service covering the transmission of messages in bulk between one office and another and distribution within buildings, however, is an important feature of the telegraph system both in London and the Provinces, and Captain Coxon's very lucid description was much appreciated by his audience.

He dealt with various aspects of the subject covering design, construction and traffic, but from limitations of time was not able to explore the whole field. So far as London is concerned, tubes at present radiate principally from the Central Telegraph Office to the more important Post Offices, Government Offices, &c., within a radius of two or three miles of G.P.O. West, but owing to the steady growth in the number, proposals are under consideration to make some of the different offices into switching centres. In fact the development is following on lines familiar in the evolution of the telephone service.

Captain Coxon expressed the view that a cheaper form of tube than the present one, which is of lead inside an iron pipe, is necessary. Iron piping is serving the purpose in France and was used in this country at one time. The cost of laying pneumatic tubes through London streets in naturally great, and any method of reducing the outlay is worthy of consideration. Unfortunately it is generally necessary to open the street for each tube laid, as the methods adopted in telephone practice of putting down plant in advance of the requirements, are not applicable to the same extent with tubes, although advantage is taken of the opening of streets to lay sections of tubes if there is any reasonable prospect of them being required. Most of the adjuncts of the pneumatic system such as traffic regulators, switches, &c., have been designed by Post Office Engineers at Headquarters and in the district.

Mr. Steed in his remarks during the discussion paid tribute to the work of the devoted band of enthusiasts on his staff who have done so much towards making the system a success.

The lecture was illustrated by some very clear slides.

Roman London.—Reference was made in these notes a few months ago to the interesting relics of ancient London which are occasionally brought to light during the excavations for the purpose of laying telephone conduits. In connexion with the provision of plant for the Monument Exchange it has been necessary to open a trench in the centre of Gracechurch Street near Leadenhall Market. At a depth of about 13 feet, an obstruction was met with which on close examination proved to be a portion of a Roman chamber which was once part of a public building or the residence of a Roman citizen of some standing. The walls were 2 feet 9 inches thick and were composed of ragstone and Roman tiles of a bright red colour. A length of about 10 feet of this wall was disclosed, and also part of another wall at right angles, the latter being 4 feet 6 inches in thickness. The walls had a coating of coloured plaster and the floor or pavement was composed of red tesserae embedded in dressed red mortar. When this was removed a layer of loose ragstones was exposed, and below this a bed of earth mixed with mortar.

In the plaster on the walls could be seen the lower part of square panels painted in black outline with a simple design which gave indication that the plaster had been painted to represent marble.

The authorities of the Guildhall Museum have made a careful examination of the remains, and have removed some of the tesserae but unfortunately were not able to remove the plaster in large pieces.

When excavations were being made for the Leadenhall Market extensive remains of an important Roman building were found, and experts considered it very probable that they formed part of the ancient Roman forum. If this theory is correct it is probable that the chamber now exposed formed a part of the same group of buildings.

When the excavators of 2,000 years hence expose the remains of the G.P.O. South and speculate on the uses to which the building was put, it will probably be for the purpose of laying in the trench some apparatus the use of which lis as much beyond our imagination as the telephone was beyond the dreams of the most advanced Roman scientist. *Materiem superabat opus.*

Obituary.—It is deeply regretted that the news has just come to hand of the death of Mr. G. W. Connell which took place on Jan. 10 at his new home at Fowey, Cornwall.

Mr. Connell recently retired and a full account of his services appeared in a previous issue of the JOURNAL.

It is also announced with much regret that Mr. T. H. Ayre of the Superintending Engineer's Office, London District, passed away on Jan. 6, 1922. He came of a Post Office family, his father having been the Postmaster of Canterbury. He entered the Post Office in October, 1885, and most of his service was spent in the Engineering department. He was a gifted organist and musician and was an Associate of the Royal College of Organists.

He bore his age remarkably well and although 62½ years of age, up to a few weeks prior to his retirement on Jan. 1, 1922, he looked to have many years of leisure before him for the pursuit of his musical attainments. The tragedy of his death after such a short illness is deplored by his colleagues and sympathy is extended to his widow and family.

Another tragedy in the London Engineering District has to be reported due to the prevailing epidemic of influenza. Mr. F. Jenkinson who had been in the service of the Engineering department for exactly 21 years, having entered on Jan. 7 1901, passed away on Jan. 7, 1922, aged 58. For many years he had charge of the heating apparatus at the Denman Street headquarters of the London Superintending Engineer. He was a most zealous officer in the pursuit of his duties, and his loss is greatly deplored by the whole staff, and their sincere sympathy is tendered to his widow and family in their distress at his sudden and unexpected decease. He had a vigorous constitution, and was ill for a few days only with influenza, when pneumonia intervened

POST OFFICE STORES DEPARTMENT

TRADE CLASSES PRIZE DISTRIBUTION AT HOLLOWAY FACTORY.

The Assistant Postmaster-General (The Rt. Hon. H. Pike Pease, M.P.), was the guest of honour at the Annual Distribution of Prizes at Holloway Factory recently to the factory and depot boys engaged in the Post Office stores department. This pleasant little function was preceded by renditions by the Holloway Factory Orchestral Society, under the able leadership of Mr. Aldridge. In addition to Mr. Pike Pease, Mr. W. H. Allen, the Controller, Mr. G. E. Mansbridge, Assistant Controller, and Mr. C. E. Fenton, we noticed on the platform Mr. C. C. Sanderson, Controller, L.P.S., Mr. A. L. De Lattre, Assistant Engineer-in-Chief, Mr. C. Smith, General Secretary of the Post Office Engineering Union, Mr. Ingram of the L.C.C. Education Department and Mr. Thomas, Responsible Master of Shelbourne Road Technical Institute.

Mr. W. H. Allen, the Controller, presided and briefly reviewed the work of these vocational classes, referring with pleasure to the appreciation which the lads show by their diligence and progress, and to the devotion of the tutors to their work. During the 1920-21 session, seven lads obtained County Council Exhibitions, tenable for three years at the evening classes at Northampton Polytechnic.

Mr. Pike Pease, after distributing the prizes, congratulated the lads on their successes and on the fine specimens of their work exhibited on benches in the room. He commended them for their wisdom in seeking to acquire all the technical knowledge within their range, and reminded them that not the least advantage arising from such knowledge was the moral sense of mastery of their jobs. At such classes they learned the why and wherefore of things, and were freed from the bondage of rule-of-thumb. The Assistant Postmaster-General, who gave two prizes for the best all-round work last year, promised to do likewise in respect of the 1921-22 session. Mr. G. F. Mansbridge thanked the Assistant Postmaster-General for his presence, and for the stimulating advice he had given the boys. He counselled the boys to mark well the emphasis which Mr. Pike Pease placed on the moral value of the training given them. Mr. Beresford Ingram, of the L.C.C. Educational Department, bore testimony to the quality of the training given in the classes and to the high standard of efficiency obtained by the lads. Mr. C. Smith, the General Secretary of the Post Office Engineering Union, congratulated the officers of the department on the work of the classes, and the lads on having shown their appreciation by diligent application.

LONDON TELEPHONE SERVICE NOTES.

Statistics.

ACCORDING to one authority there are three forms of prevarication; lies; d—— lies; and statistics.

However, this may be, the statisticians themselves probably prefer the dictionary definition –a collection of facts tabulated numerically—and will plead, that, having presented the facts, they are not to blame if the figures are employed to deceive.

Statistics are employed mainly in two directions; for study, or for exhibition. When they are employed for the latter purpose there is often the suspicion that something less than the truth is presented, perhaps because the exhibitor has rejected some of the statistical evidence as irrelevant, but sometimes we fear, perhaps not. The statistical enthusiast is frequently to be found in the ranks of the exhibitors, but as a rule we know there is a show on and refuse to let "Mr. Statistics" take possession of our better judgment.

The study of statistics is quite a different matter. Here the student is seeking information and searching for signs and portents; he follows where the facts lead him; he casts none of them aside without examining them with the greatest care and deliberation. He does not mind admitting that although he is forced by the weight of evidence to a certain conclusion, yet some of the facts are hostile witnesses.

Since the successful development of the telephone business depends largely of the accuracy, first, of statistics themselves and secondly on conclusions drawn from them it behoves us to satisfy ourselves that we have reviewed *all* the facts *every* time. Extracted figures are useful in their way, but we should always remember that they are not the whole story; they may be likened to the spires and towers of a town which enable the traveller to recognise the town from a distance but give little indication of the character of the inhabitants.

* * * *

London Telephonists' Society.

The annual dance of the London Telephonists' Society was held at Bishopsgate Institute on New Year's Eve and was once more an unqualified success. The demands for tickets, which had to be limited to 250, far exceeded the supply and practically all were allocated a month before the event. All the principal exchanges were represented in the gay company which assembled.

Mr. Skinner's Orchestra was once more in attendance and in very best form, and the dancers needed no encouragement to respond to his inviting melodies. Attractive as the supper tables looked many of the company were reluctant to tear themselves from the music even for a brief half-hour.

It was a matter of regret to all members of the Society that their President, Mr. M. C. Pink, was unable to be with them owing to recent family bereavements. In his absence Mr. G. Buckeridge was indefatigable in performing the duties of both M.C.s. The members who so thoroughly enjoyed the evening can look forward to a repetition of the event next season as the hall has been booked for Dec. 30.

* * * *

The next meeting of the Society will be held at the usual place of assembly on Wednesday, Feb. 8, when the successful competitors in the annual competition will read their papers.

* * * *

Standard Expressions.

Appropos last month's notes on standard expression, the following is an example of the awful consequences of falling from grace to the extent of saying "Line engaged" instead of "number engaged."

Small child :–"Mother; why do they keep lions at the Telephone Exchange?"

Mother :—"They don't dear, what makes you ask?"

Small child :—"Because when I rang up Daddy, they told me the lion was engaged."

(*Windsor Magazine.*)

* * * *

Culled from the Exchange.

Victoria Exchange.—On Saturday, Jan. 7, the Engineering and Traffic staffs combined in entertaining 420 poor children connected with the Wesleyan mission, Lambeth, to a Christmas Tea.

This was followed by an entertainment which consisted of dances, songs, and a performance by the Victoria Engineering Staff's Minstrel Troupe.

The children were delighted with the performance and manifested their pleasure by the hearty and fervent singing of the choruses. Towards the close of the festivities, Father Christmas and a Christmas Tree appeared on the stage and each girl was given a doll which had been daintily dressed by members of the staff. The boys each received a penknife or a mouth-organ and another toy. On leaving each child took away a bag of fruit and sweets and a new penny. The happy smiling faces of the kiddies as they toddled out were proof of the success of the entertainment and amply rewarded those who contributed to the treat.

* * * *

By means of weekly subscriptions the Victoria staff accumulated a fund amounting to £70 which has been divided between the Westminster, St. George's and St. Bartholomew's Hospitals.

* * * *

Regent Exchange.—Regent Exchange staff had a most enjoyable evening on the occasion of the dance they gave at the Shaftesbury Hotel on Dec. 14. Although on a much smaller scale than their usual functions, it lost none of the spontaneous gaiety which always prevails at Regent festivities. The small cosy hall had the effect of making it seem a happy family party.

* * * *

On Dec. 22, the Gerrard and Regent Catering Committee entertained all the members of their club to a Chirstmas Dinner. The menu contained all that is associated with yuletide feasting—Turkey, Christmas Pudding, Fruit, and Crackers. The guests found the most piquant moment of the occasion when they did *not* have to ask for bills and wait at the cash desk.

* * * *

"If."

(Certainly not by Rudyard Kipling.)

If subs. were only tractable,
And Radials* were not;
O! then would we telephonists
Enjoy a happy lot.

If lunch time was an hour,
And tea-time nearly half;
We'd greet our labours joyfully—
Upon our lips a laugh.

If we could have a telephone
For just "Two pennies please!"
Fixed up within our rest room,
To 'phone our "boys" with ease!

If someone would but banish
Those Saturdays we hate,
Which come so very frequently
And are known as "long and late."

If a scheme of ventilation
In Exchanges would prevail,
Whereby we'd neither roast alive,
Nor perish in a gale;

Man wants but little here below,
And women even less;
Will someone grant our wants and earn
Our lifelong thankfulness?

For then in gratitude we'd count
The blessings we have got,
But most especially I think,
If Radials were not!

(DOROTHY TURNER.)

* It should be explained that by "Radials" is meant the time-recording machines in which telephonists record their arrivals and departures.—(ED., T.& T.J.)

OVERHEARD.

Stores Clerk (*on telephone*) :–

"Stores speaking . . . What's that? . . . Punch, oh yes, Sir, . . . fine paper . . . yes, indeed . . . but beyond the range of a Civil Servant's salary . . . Eh? . . . some mistake . . . I'm not contradicting you, Sir, but really . . . conviviality . . . I quite agree . . . punch-bowl!!! . . . what the dickens! . . . Yes! . . . certainly he mentioned it . . . Pickwick and others' enjoyment . . Oh! Dickens, . . . Ah; now I get you. . . . May I remind you this is the Stores Department speaking . . . What . . . you know it is, do you . . . well . . . not a periodical you're speaking about. . . . Ah! now I hear you better . . . requisition relative to paper-punch. . . . Sorry, old man, how funny . . . I'll look it up and urge it for you . . . good-bye-ee!"

OBITUARY.

REGINALD MYLES HOOK.

ON New Year's Eve there passed away from this life a notable member of the Engineering staff of the British Telegraphs in the person of Executive Engineer Reginald Myles Hook, M.B.E., A.M.I.E.E.

He was the son of the Rev. F. P. Hook, at present curate of St. Faith's, Stepney, who was himself in the Civil Service before taking Holy Orders. Myles was appointed S.C. & T. in Limerick, the city of his birth, in 1894. He was passionately fond of music and has been organist at several churches, and at one time held the post of assistant organist of York Minster. Latterly he had taken up orchestral work and was conductor of the Southend Symphony Orchestral Society. In this connexion it is not surprising to learn that he was perhaps one of the greatest authorities on Time, and was awarded the silver medal of the I.P.O.E.E. on "Correct Time" in 1912. It was Myles Hook who developed the present system of G.M.T. distribution by the introduction of sub-chronophers at Provincial centres. This was only one of the features of his engineering knowledge as will be recognised when it is cited that he contributed articles in Kempe's Engineers' Year Book on the Slide Rule, Pneumatic Transmission, Steam Engine Indicators, Light, Gas Testing, Clocks, &c. There is little doubt but that his strenuous life as captain of H.M.T.S. *Madia* and the hardships which the duties of this tiny submarine cable laying vessel entailed during the war had undermined his strength, and sapped even at his marvellous energy so that a chill brought on an attack of pneumonia all too quickly in its train.

He was a keen amateur yachtsman and a member of the Committee of the Essex Yacht Club. With his delight in engineering he could not resist a certain preference for his own motor-boat, while the claims of his model of a home workshop also held a warm corner in his affections.

Bluff and hearty, he had the tenderness of a woman towards the weak, and a practical sympathy for the man who was down which would brook no mention of thanks or gratitude. His ruggedness of speech was a mere mask to the finer qualities of one who amongst men had the undeniable right to be called a man. It was no mere formal crowd of sight-seeing mourners that stood round the grave in Leigh Cemetery, but rather representative friends from every phase of those activities which had crowded a life pulsating with action, a gathering of men and women who will feel the gap his death has left for many a day to come.

J. J. T.

W. J. RIGG, OF LIVERPOOL.

We have to announce, with sincere regret, the death of Mr. W. Rigg, Assistant Superintendent of the Telegraph Branch, Liverpool Head Post Office. Mr. Rigg was one of the oldest agents of this JOURNAL. Himself a keen enthusiast for technical matters, he spared no opportunity of encouraging others, and was always ready to spend himself both in the application of his knowledge to the actual needs of the Service and in distributing his knowledge to others. He was more than a technical enthusiast, however. He had many interests in other things outside the office, and he was well known to take a particular delight in running a little telegraph system of his own at church bazaars and the like, charging what used to be, before the war, a penny for his little telegrams. He was a great-hearted and a buoyant character. In days gone by he devoted himself to the study of the technical details of telephony with a zest which led him into strange adventures, and it is said that on one occasion, finding that a fault on a wire many miles from Liverpool had not been removed as quickly as he had hoped, he went out on his own bicycle and mended the fault. His technical knowledge was not merely the knowledge of books: he was one of the happy men who could make things with his hands, and he left behind him tangible evidences of his skill and ingenuity which many of us might well envy. He was loved and lovable; he was sincere, earnest, and ready to sacrifice himself for the good of anyone whom he might help. We offer to his widow and his friends our sincerest condolences and we bid them remember that in William Rigg they have lost one who left the most precious of marks on the Telegraph Service.

J. L.

PERSONALIA.

LONDON TRAFFIC STAFF.

Resignations on account of marriage.

Miss K. M. BLACKMORE, Assistant Supervisor, Class II, Trunk Exchange.
Miss W. CHANTER, Assistant Supervisor, Class II, City Exchange
Miss R. D. PIZZEY, Telephonist, Trunk Exchange.
Miss N. M. TRETHEWEY, Telephonist, Trunk Exchange.
Miss G. E. MANSELL, Telephonist, Trunk Exchange.
Miss R. C. READ, Telephonist, City Exchange.
Miss G. F. GRIFFITHS, Telephonist, Hornsey Exchange.
Miss J. GORDON, Telephonist, New Cross Exchange.
Miss T. F. MALYON, Telephonist, New Cross Exchange.
Miss D. M. R. HINES, Telephonist, Regent Exchange.
Miss O. R. WHITE, Telephonist, Regent Exchange.
Miss H. W. E. PAXTON, Telephonist, Toll Exchange.
Miss M. L. BIRCH, Telephonist, Museum Exchange.
Miss D. J. HOWARD, Telephonist, Holborn Exchange.
Miss H. A. PURDIE, Telephonist, Holborn Exchange.
Miss N. L. BRAY, Telephonist, Holborn Exchange.
Miss E. H. JONES, Telephonist, Central Exchange.
Miss K. GLEN, Telephonist, Central Exchange.
Miss V. M. IRWIN, Telephonist, Supt's. Office, F.E.S.
Miss E. J. HOLLEYMAN, Telephonist, Victoria Exchange.
Miss A. M. MILLER, Telephonist, East Ham Exchange.
Miss E. F. RYTON-BENSON, Telephonist, East Ham Exchange.

EASTBOURNE.

A very pleasing and interesting ceremony took place on Friday, Jan. 6, at the Town Hall, when the Mayoress (Mrs. J. Duke), presented Mr. Arthur Miles (Skilled Workman, Class II) with the silver medal (first class), and £2 10*s.* given by the City and Guilds of London Institute for the final examination in Telegraphy (Full Technological). Several members of the telephone staff attended. The congratulations and good wishes of the local staff go to Mr. Miles.

RETIREMENT OF MR. F. A. CARMICHAEL.

Mr. F. A. Carmichael, Chief Superintendent, Telegraphs, Manchester, who retired, under the age limit, on Dec. 23, entered the Service as a learner in January, 1876, and 11 years laters was promoted to the grade of First Class Telegraphist. During his career as a Telegraphist he was employed for some years at the Manchester Stock Exchange B.O., and for about three years held the appointment of Inspecting Telegraphist in the Manchester District. Promoted to the class of Clerks (now the Overseer class) in 1897, he acted for some time as Clerical Assistant to the Instrument Room Superintendents. Further promotion to the class of Assistant Superintendent, Class II, quickly followed (December 1900) and subsequent advancements were: Assistant Superintendent, Class I, July 15, 1907; Superintendent, July 1, 1913; Chief Superintendent, Oct. 30, 1916.

Mr. Carmichael was well known outside Manchester, having taken charge at various special events. He also came into association with supervising officers elsewhere on many occasions, notably in connexion with Telegraph Conferences at Headquarters, whilst he was a member of the Committee which recommended the abolition of office copies of received telegrams. For his services on this Committee he received the thanks of the Postmaster-General.

Mr. Carmichael was always anxious that the reputation of MR. should be maintained, and ever appreciative of good service. He was of genial disposition, invariably considerate for others, and was held in high esteem, particularly by those whose intimate acquaintance enabled them to form a reliable opinion of his good qualities. By his retirement, after practically 46 years' service, the Department loses a painstaking, conscientious officer, and the Manchester staff a considerate Chief and friend.

RAMSEY VILLAGE AUTOMATIC EXCHANGE.

BY L. B. LUGET, HEADQUARTERS TRAFFIC SECTION.

THE transfer of the Ramsey (Hunts) Exchange from Central Battery Signalling to Automatic working was effected satisfactorily at 1 p.m. on Monday Oct. 24, 1921. As this is the first exchange to be provided with Village Automatic equipment, it is thought that a description of the system and of the facilities which are available will be of interest.

The question of installing equipment of this type at a number of small exchanges for experimental purposes has been under consideration for several years. Progress in this direction was, however, suspended until after the War. It was then decided to instal this equipment at two exchanges only, viz., Ramsey and Hurley. The latter exchange was brought into use on Dec. 20 last.

The equipment has been specially designed to serve rural areas, as its name implies, in order to reduce the cost of providing for night and Sunday service. It will, normally, be unattended, and for this reason it has been made as simple as possible in order to reduce the amount of attention required and to keep the cost low.

The system is somewhat limited, due to the desirability of keeping it as simple as possible, and it does not provide for certain facilities which are normally available under the manual and larger automatic systems. It is also restricted, in its present form, to exchanges having an ultimate development of 100 subscribers' lines and junctions. No provision is at present made for party-lines, coin-box lines, PBX and auxiliary lines, or for the interruption of local calls in favour of long-distance trunk calls. As none of the special classes of service mentioned above were required at Ramsey and Hurley, it was decided to instal automatic equipment of this type at these exchanges. If, however, any of these facilities are required at a later date, special arrangements will have to be made. For example, if a subscriber requires two or more lines it will be necessary to show two numbers in the directory. These would have to be dialled as separate numbers and it would be necessary for the telephonists at exchanges having dialling-in facilities to remember that they were alternative numbers.

Ramsey exchange is situated about 13 miles from Peterborough. It has two outlets, one to Peterborough, which is regarded as the controlling manual exchange, and the other to Warboys Exchange, which is situated within the Ramsey Exchange local fee area. The new equipment, which has been installed by Messrs. Siemens Brothers and Company, Limited, is accommodated on the first floor of the Post Office. The system is a 40-volt one, and two batteries of secondary calls are provided. Consequently, a fairly large amount of accommodation is required for an exchange of this type.

The system is of the two figure type, and Ramsey subscribers desiring connexion with a Warboy subscriber dial 00. Enquiries, complaints, and all other trunk and junction calls, circulate *via* Peterborough, for which 01 is dialled. Similarly the Peterborough telephonist gains the attention of the Warboys attendant by dialling 00 and Warboys gains the attention of Peterborough by dialling 01. Warboys Exchange has only one outlet and all trunk calls have to be obtained through Peterborough *via* Ramsey.

The initial equipment provides for 8 simultaneous connexions and is designed to accommodate 40 subscribers' lines (Nos. 20 to 59), 8 trunks too Peterborough and 1 junction to Warboys. It is not anticipated, however, that more than 5 trunks to Peterborough will be required during the initial period. Each subscriber's line and each trunk and junction circuit is a associated with a pre-selector, 50 pre-selectors and 8 final selectors being provided. There are 32 subscribers' lines, 4 bothway trunks to Peterborough, and 1 bothway junction to Warboys at present working.

The ultimate capacity of the equipment is for 80 subscribers' lines (Nos. 20 to 99), 10 trunks and junctions, and provides for 12 simultaneous connexions Where, however, more than one group of junctions is required, as in the case of Ramsey, the junction capacity is less than 10 owing to the appropriation of a terminal in each group for the engaged signal, as explained later. The junction and trunk circuits are allotted numbers 01 to 00. It will be seen

Digitized by Google

that it is not proposed to use level 1 (Nos. 10 to 19). This level on first selectors is generally not used on account of the liability of accidental connexions due to faults or to a careless manipulation of the switchbook by calling subscribers. If, however, level 1 were used it would be possible to accommodate 90 subscribers lines.

Each subscriber's line is associated with a pre-selector for originating calls and is multipled on the banks of the final selectors for incoming calls. The selectors are of the vertical and rotary step by step type and respond to the impulses from the dial.

When a subscriber removes his receiver, it causes the pre-selector to hunt for an idle final selector. As soon as connexion has been made with an idle final selector, a "Dialling tone" is transmitted to the subscriber. This is a continuous clicking sound and indicates to the subscriber that he may commence dialling. This tone operates until the first digit has been dialled.

As soon as the required number has been dialled, the subscriber receives the "audible ringing signal," in the case of local calls, if the called subscriber is disengaged. This is an intermittent clicking sound and indicates that the required number is being rung. Subscribers do not at present receive this tone in the case of originating junction and trunk calls, but the question of providing the tone in such cases is being considered.

If the called subscriber is engaged, the selector switch moves to an eleventh contact, which is fitted on each multiple bank, thereby transmitting an intermittent buzzing sound to the calling subscriber. When more than one group of trunks or junctions is necessary, as in the case of Ramsey, a terminal at the end of each group is appropriated for supplying the engaged, signal. This is not, however, necessary in the case of the last group as the eleventh contact is then used.

Should a subscriber receive a continuous buzzing sound, after the number has been dialled, it indicates that the number is unobtainable for some reason other than "number engaged" or "no reply" This tone which is known as the "number unobtainable tone" operates in the case of subscribers dialling dead levels, spare, ceased, or changed numbers, or lines temporarily out of service. The tone is not usually used in connexion with changed numbers, but it is necessary to do so in this case as no interception circuits are provided. It is not anticipated, however, that there will be any frequent changes of numbers in an area such as Ramsey.

It is interesting to note that Ramsey Exchange is the first exchange to be equipped with the four tones already described. These tones are now regarded as standard and are being introduced at existing automatic exchanges and will be provided at all new automatic exchanges. The Ramsey subscribers have been visited and it is satisfactory to know that they understand the meaning of the various tones and that they are not experiencing difficulty in distinguishing between them.

In the case of local calls automatic registration takes place when the called subscriber answers. Originating trunk and junction calls are not, however, registered automatically, and consequently these calls have to be ticketted at Peterborough and Warboys, the number of the calling subscriber being ascertained.

"Back release" conditions apply in all cases, *i.e.*, the connexion is released when either subscriber replaces his receiver. The subscriber is not held by the telephonist in the case of originating or incoming junction calls as at the larger automatic exchanges.

Separate trunk and local exchanges at present exist at Peterborough. As most of the trunk calls originated by the Ramsey subscribers are for exchanges beyond Peterborough, and cannot be completed on demand, it was arranged to terminate the Ramsey-Peterborough trunks in the Peterborough trunk exchange. These lines, which are 13 miles long, terminate on one position. A dial and four dialling keys, one in association with each trunk, are fitted on this position.

The trunk exchange is closed at 7 p.m. when all lines are switched over to the local exchange where a dial and dialling keys are fitted on one position. Dialling facilities have also been provided at Warboys Exchange.

The method of operating calls at the trunk exchange is as follows: To call a Ramsey subscriber the telephonist inserts a calling plug into a disengaged outgoing jack, and listens. When the "dialling tone" is heard, the dialling key, associated with the trunk circuit in use, is moved into the dialling position. The number of the required subscriber is then dialled and the dialling key restored. If the subscriber is disengaged, the "audible ringing signal" is heard until the subscriber answers. If the "number unobtainable tone" is heard, the number is verified and if found to be a working number is redialled. If the tone is then received the line is probably faulty and is reported in the usual way. When conversation is finished a clearing signal is given in the usual manner. As the subscriber's numbers commence at 20 under the new system, certain numbers have had to be changed. It has been arranged, therefore, for all inward calls to Ramsey subscribers to be intercepted for a time in order to ensure the connexion of the correct subscriber. Trunk calls originated by Ramsey subscribers are received at Peterborough on jack-ended equipment, and the insertion of an answering plug into an incoming jack connects the telephonist direct with a Ramsey subscriber or the Warboys attendant as the case may be.

In order to relieve the Sub-Postmaster, in this and similar cases, from the necessity of giving attention to alarm signals, a system has been devised whereby the existence in certain faults is notified automatically to the controlling manual exchange. The presence of any urgent fault which would interfere with the working of the exchange is notified to the Peterborough Trunk Exchange telephonist by an intermittent actuation of the calling indicator on Ramsey No. 4 trunk. The arrangements are such that the fault signal is not operated if the trunk is otherwise engaged, also that when a fault signal is being given the trunk tests engaged. Immediately any fault signals are received the Engineering staff are notified.

As an additional safeguard it has been arranged that the Peterborough telephonist by dialling 19 on any of the first three Ramsey trunks will receive the "number unobtainable tone" if the equipment is free from urgent faults. The presence of a fault will be indicated by the receipt of the engaged signal. This test is carried out three times daily and is, of course, in addition to the routine test on each trunk which is carried out at 8 a.m. The routine test on the Ramsey circuits is effected by dialling on one trunk the number of another trunk. For example, if 02 is dialled on No. 1 trunk a calling signal should be received on No. 2 trunk. Similarly when 01 is dialled on No. 2 trunk a calling signal should be received on No. 1 trunk.

If a subscriber leaves his receiver off the switchhook, or if a fault develops on a subscriber's line circuit, the switching equipment is automatically released after a certain interval. The presence of such faults is not notified to the Peterborough telephonist, and subscribers are requested to report them by the best means available.

The generator for charging the batteries is driven by a petrol engine. There are two batteries of secondary cells. The present arrangements are such that the first battery supplies the whole of the power for working the exchange for 48 hours. At the end of that period the second battery replaces the first one and supplies the power for working the exchange for a similar period. When the first battery is cut out, the generator is automatically brought into use and charges the cells until they reach a specified voltage. The charging then ceases and the petrol engine stops. The charging of the batteries is controlled by a clock mechanism, the above cycle being repeated every 48 hours.

The Ramsey subscribers have been visited by a number of the district Traffic staff, and all expressed themselves as very pleased with the new system, which they consider is a great improvement on the manual system.

THE TELEPHONE DEVELOPMENT OF THE WORLD AT DECEMBER 31, 1920.

BY W. H. GUNSTON.

(*Continued from page* 67.)

ASIA.

	No. of Telephones.
Japan (305,275)**	est. 320,000
Chosen (12,372)	13,000
Manchuria (7,848)	9,000
Sakhalin (1,248)	1,500
Formosa (7,892)	9,000

Siberia, Russian Turkestan, etc. (1915) ...	18,600
Philippines (say)	8,000
Iraq, Palestine, and Syria (say)	2,000
French Indo-China (1,610)	est. 2,000
	507,000

** Figures in brackets refer to 1919.

Population 910 millions or 1,794 inhabitants per telephone.

Official figures have been received from the Chinese Administration and from the Oriental Telephone Company. The statistics for most of the other States are based on official figures for 1919. Pekin has 9,227 stations. Tientsin 5,060, Hankow 3,241, and Hong Kong 6,112. In India there are 6,838 stations in Calcutta, and 9,709 in Bombay, Karachi and Ahmedabad. The figures for Siberia are pre-war. The telephone is at last making its appearance in Western Asia and systems are working in Iraq, Palestine and Syria. Persia is believed to have inaugurated an exchange.

Madagascar (558)	600
Mauritius	948
Southern Rhodesia	1,181
South Africa, Union of (42,419)	49,634*
	95,000

Population 180 millions, or 1,900 inhabitants per telephone.

* June 30, 1921.

** The figures in brackets refer to 1919.

The only systems of importance are those in Egypt, Algiers, Tunis and South Africa. The latter is by far the largest (49,634 stations). Johannesburg has 13,558 telephones, and Cape Town 6,880.

NORTH AMERICA.

	No. of Telephones.	Population (thousands).	Population per telephone.
Canada (778,578)**	856,266	8,593	10
U.S.A. (12,688,700)	13,411,379	105,710	8
Mexico*	41,684	16,000	384
Cuba*	30,654	2,889	97
Dominican Republic* and Haiti	1,569	3,400	—
Central America*	13,852	6,092	—
	14,355,404	142,700	9.9

*Jan. 1, 1920.

** Figures in brackets refer to 1919.

Canada had 856,266 telephones in 1920, an increase of 77,508 over the previous year. They are distributed in the principal States as follows:

Quebec	135,530
Ontario	364,798
Manitoba	69,902
Saskatchewan	90,596
Alberta	54,482
British Columbia	75,422

Ten Canadian cities possessed upwards of 10,000 telephones, viz.:—Montreal, Toronto, Ottawa, Hamilton, Quebec, Vancouver, Victoria, Winnipeg, Edmonton, and Halifax, N.S.

The United States.—The number of telephones increased from 12,668,747 to 13,411,379 made up as follows:

Owned by Bell Companies...	8,333,979
Connected with Bell Companies' system ...	4,267,956
Totally independent systems	809,444
	13,411,379

About 100 cities in the United States possess upwards of 10,000 telephones.

Mexico, Central America and West Indies.—The figures given refer to 1919 and are furnished by Mr. V. M. Berthold.

SOUTH AMERICA.

(JAN. 1, 1920).

	No. of Telephones.	Population (thousands).	Population per telephone.
Argentina	111,122	10,000	90
Bolivia	2,517	—	—
Brazil	76,837	29,000	377
Chile	25,871	5,850	225
Colombia	5,935	—	—
Ecuador	3,176	—	—
Guiana	1,898	—	—
Paraguay	428	—	—
Peru	7,850	—	—
Venezuela	8,119	—	—
Uruguay	20,984	1,463	70
	264,737	67,203	243

Say 277,000 telephones at end of 1920.

These figures are from the same source as the foregoing and also refer to 1919. The total is 264,737 and an estimate of 277,000 for 1920 would be quite justified in view of the steady telephonic progress of South America,

AUSTRALASIA.

	No. of Telephones.	Population (thousands).	Population per Telephone.
Australia (215,930)* ...	233,406	5,030.5	21
New Zealand (80,798)* ...	88,541	1,196.5	13.5
	321,947		

* Figures in brackets refer to 1919.

Australia.—Telephones in Australia increased from 215,930 in 1919 to 233,406 in 1920. New South Wales had 94,355, Victoria 69,118, Queensland 29,168, South Australia 20,464, Western Australia 13,281 and Tasmania 7,020.

There were 57,958 telephones in Sydney, 48,034 in Melbourne, 12,519 in Brisbane, and 15,798 in Adelaide.

New Zealand had 88,541 stations in March 1921, as against 80,798 in March, 1920. Auckland had 7,497, Wellington 7,685 and Christchurch 6,087.

Jersey City	39,069	*The Hague* (1919) ...	19,831
Leipzig	38,830	Louisville, Kentucky* ...	18,025

*These figures refer to the Bell Co.'s stations only. At least 10 per cent. should be added for independent stations.

The Report of the Wireless Telegraphy Commission dated Dec. 5, 1921, has been issued as a Command Paper No. 1752 of 1922 (price 1s.). Its recommendations may be briefly summarised as follows:—

Thermionic valve stations should be erected in England, Canada, Australia, South African, India and Egypt, and arc stations in East Africa, Singapore and Hong Kong. Each transmitting station should be allotted two wave-lengths and, except in Canada, a central receiving station should be equipped for simultaneous reception from the other stations.

The cost, excluding the stations in Canada, Australia, South Africa and India for which the Dominion Governments would be responsible, is estimated at £853,000.

THE BAUDOT—XXX.

By J. J. T.

(*Continued from page* 76.)

THE spring S (Figs. LXXVI, LXXVIII. See also Fig. XL. Vol. VII, No. 69) of each appendix lever L should be adjusted so as to retain the levers when at rest with a clearance of about $\frac{1}{32}$ in. in regard to the shuttle cam (Figs. XL-XLII, Vol. VII, No. 68) and to determine the play of these levers so that when in the rest position the horizontal portion of L shall remain well engaged in the retaining slot of S^1 (Fig. LXXVIII), but with the minimum of pressure. To obtain the first adjustment the height of S is adjustable by means of the block and the two screws at S^2. To obtain the required tension of S these two screws should be very delicately screwed tighter or looser respectively to give more or less tension. To determine whether the adjustment is correct, press the horizontal portion of L downwards on to the lowest slope of the slot S^1, then with equal deftness permit L to rise. In so doing it should engage right into the slot so that if now forward pressure is brought to bear on the back of S^1 no noticeable movement of the engaged lever will be felt.

For the workshop only, according to British practice, the following method may also be followed :—Remove the bridge-piece above the appendixes so that the latter may be thrown back on their hinges. This will permit the levers L being placed in the position as shown (Fig. LXXVIII). The extremities of each should then cover half the width of the block S^1 and its screws as shown by the dotted line.

The screws on the block S^2 are capable of adjustment without dismantling the apparatus if a special screw-driver be employed,

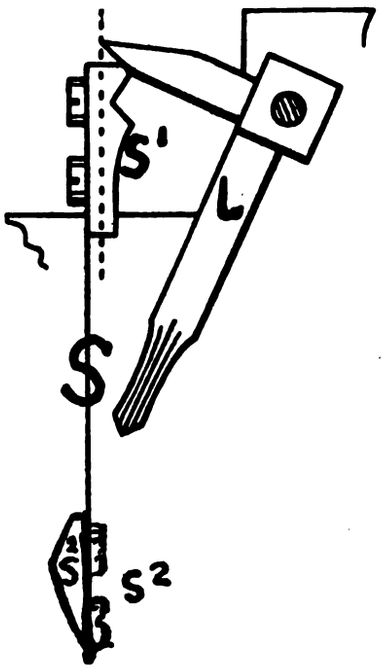

FIG. LXXVIII.

but such adjustments in practice are very rarely needed except in workshop overhaul where dismantling is done as a matter of course. Naturally the adjustments by means of S^2 are of a very fine nature.

The levers themselves should be perfectly free on their spindle and should be absolutely free and independent in action of one another upon it. Lubrication should receive due attention, but a tiny drop of oil between each lever and the washers is all that is necessary. The spindle itself should be rigid and straight. See that the end screws are properly tightened. Failure of this precaution may lead to breakage.

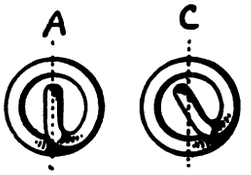

FIG. LXXVA.

The Shuttle Cam.—This should be carefully lubricated also as there is considerable friction in the selecting channels of the cam.

The two following items together with their appropriate diagrams should have followed Article XXVIII. The illustrations will therefore take the numbers of Figs. LXXVA and LXXVB.

The Baudot governor springs in general use are designed to run at 1,800 r.p.m. with a good margin fast or slow of that figure. Small differences in speed may be made by adding to or removing from the octagonal governor weight M (Fig. LXXIV) very small

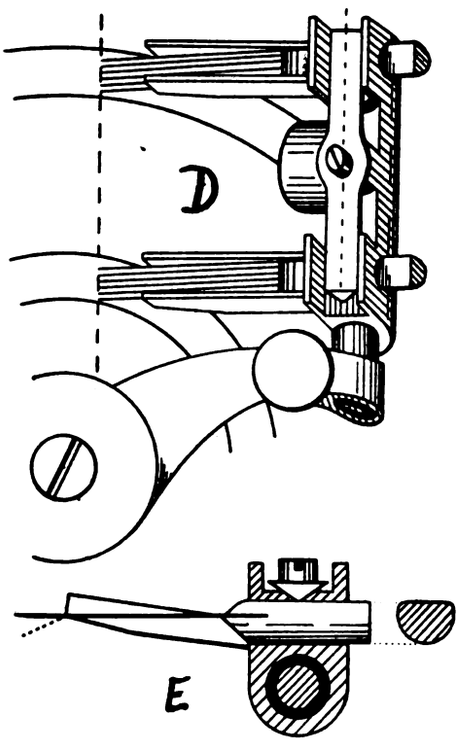

FIG. LXXVB.

masses or weights, respectively to slow down or to increase the speed. Larger differences are obtained by screwing the governor springs farther into or out of the weight M. By doing the first we bring a *lesser* number of spring spirals into play, thus *decreasing* the effective number of turns of the springs, and consequently *increasing* the speed. By taking the second course the effective number is *increased*, thus *decreasing* the speed. When making either of these adjustments care should be taken that each spring be screwed in or out, as the case may be, an equal number of turns to its fellow. Each spring should only be turned one-half turn at a time. The eyelet of the free end of the spring should always be placed in relationship to the adjusting bar as at A (Fig. LXXVA) and not as at C.

Digitized by Google

Brushes.—In adjusting brushes the ends should not extend more than $\frac{3}{16}$ in. beyond the troughing of the brush carriers, and the ends of any pair of brushes should fall into alignment along the same radius (Fig. LXXVB). To exceed the prescribed length beyond the carriers leads to many faults, for example, "spreading" of the brush ends and thus liability to short circuiting with a neighbouring ring. If the recognised length be not exceeded the relationship between the various pairs of brushes is more easily maintained; thus standardised, when any one brush needs changing, it can be more rapidly and more accurately replaced. Each brush at the point where it leaves the troughing should be so fixed that only a gentle pressure is given at the edge where the brush leaves the troughing, see E (Fig. LXXVB). The dotted line shows in exaggerated form an incorrect manner of fitting a brush. All brushes should be neatly trimmed. All short hairs should be cut away. They are a source of short circuits, false letters, and on Ring I false correcting currents. Do not use brushes which are too short. They tend to give heavy pressure and to wear the plates. The slope of each trough should not be too acute nor the pressure of the brushes heavy.

(*To be continued.*)

THE EDINBURGH TELEGRAPH AND TELEPHONE SOCIETY.

THE Edinburgh Telegraph Department has recently started the above-named Society with Brigadier-General Price, C.B., C.M.G., &c., as President, and Major A. A. Jayne, D.S.O., &c., Controller of Telegraphs, and Mr. Macfee, Telephone Superintendent for Scotland, as Vice-Presidents. The inaugural meeting was held on Jan. 31, with Brigadier-General Price in the chair. A paper, of which a copy is reproduced below, was read by Major Jayne on Vocational Training. There was a large attendance of telegraph and telephone personnel, and a most helpful and interesting discussion took place. The Telegraph Sub-Committee of the Society is composed of Mr. E. H. Fisher, Superintendent Telegraphs, Chairman; Miss Douglas, Mr. Weir and Mr. Ingram, with Mr. Lamb as Secretary.

VOCATIONAL TRAINING.

BY MAJOR JAYNE, D.S.O., &c.

The report of the Whitley Sub-Committee on the question of training after recruitment to the Post Office Service is a timely contribution to this important subject, especially just now when there appears to be an awakening of interest in the subject of finding suitable men and women for specific vocations rather than the old system of endeavouring to find what kind of work was best suited to men and women already in vocations.

Seeing that it has already been recognised by the Department that it is desirable to train young telegraphists at properly equipped training centres, the next step is to place the training at those centres on a scientific basis, mainly in the direction of studying internals or the subjective mind rather than purely externals. The Whitley Sub-Committee have indeed suggested something in the direction of scientific analytical study of telegraph learners—that is, they recommend a careful record to be kept at each training centre of the progress of each pupil, and that for a period of two years from the date of the application of their report it should be supplemented by records of the subsequent career of the young telegraphist after he has been passed as qualified.

The Edinburgh Telegraph Branch has recently been going rather farther in these directions than is suggested by the Whitley report. First of all, considerable attention is being given to recruiting the right kind of young person for girl probationers and boy messengers. Having regard to the fact that the Post Office Service is largely recruited from these primary grades, it is obviously of vital importance that they should produce the right sort of employee for the careers in the Post Office that are open to them. The initial difficulty in selecting for those primary grades is that it is not known what positions in the Service the young people will subsequently occupy; they may be telegraphists, sorters, telephonists, postmen, &c. It appears, therefore, that the only general line to adopt at this stage is to find some common factor which will govern the entry of a young person into the Service. General intelligence is a safe one and the opinion of the officers employed on the recruiting duty supplemented by simple tests will probably be as valuable as certificates of scholastic ability obtained from the schools; but both should be taken into account. This common factor must not, however, be confused with suitability for any specific vocation in the Post Office.

In addition, the candidates for employment should come up to the Departmental standards or show a practical certainty of coming up to those standards in due course—that is to say, in height, general appearance, absence of any physical disability, &c. If possible a record of a boy or a girl's moral, intellectual and physical characteristics should be obtained from the school-masters. All this information should be recorded on a history card relating to the new entrants, and it should follow them throughout their career as boy messengers or girl probationers until the time when they are to be trained for higher positions.

The particulars as regards training, which I will deal with more fully later, should also be recorded, and then onwards to the time suggested by the Whitley Sub-Committee.

At the present time a certain number of boy messengers and girl probationers are given opportunities of becoming telegraphists provided they possess certain educational qualifications. Here we see the factor of scholastic ability or general intelligence determining whether or not a boy or a girl should become a telegraph learner. I am hoping in the future that the records I have described will play an important part in determining the future positions of boys and girls in addition to scholastic ability, but before we can arrive at that stage it is necessary to make very careful analytical studies based upon detailed records, and this of course involves a year or two's study before anything can be decided.

Upon arriving at the stage where we wish to select personnel for Telegraphists, we have first of all to determine two vital questions:—(1) What are the requirements of the telegraphist's occupation; (2) what sort of person is the best for that occupation.

My own view is that this person should be one who has a well-developed sub-conscious mind. If this is the case our analytical study should probably be as follows:—

(1) Can he do two things at once—that is to say, ask him to write down from memory something he knows by heart such as a selection from Shakespeare or Burns. In the middle of writing it down, is he capable of making an intelligent reply to a question on another subject entirely?

(2) He should then be seated at an ordinary telegraph key and asked to take hold of the key as if he were about to operate it. The instinctive manner in which he grasps the key should be noted.

(3) What kind of wrist has he and how does he naturally place his arms?

(4) By *sound* he should be taught the difference between a dot and a dash, and then immediately asked to distinguish by *sound* the difference. The action of the mind to sounds will thus be disclosed.

(5) Telegraphist's work is no longer confined to sending and reading by Morse key and Sounder. Keyboard working occupies a prominent part in his occupation, and this includes Baudot operating and the working of keyboard perforators and typewriters. In this connexion, therefore, it is necessary to have some idea of the candidate's memory span, sustained attention, the sense and strength of touch, and the quality of strength in the two hands.

In carrying out these studies the procedure of the tests and the results must be standardised. The test which candidates undergo must always be the same and the instructions given to them identical.

By such a process as that indicated in the foregoing, it may be possible to determine the right sort of person for the occupation of telegraphist.

After training has commenced there must be trustworthy standards of results at different periods classified for example as "Good," "Fair," and "Inferior." There must also be the same instructor who has been selected with great care, and refined methods of observing and examining the pupils. The conclusions made at the end of the training will not depend so much upon the results achieved as upon the relative extent of the progress made with a *standard* amount of progress.

With analysis on the foregoing lines it is fairly certain that time and money will not be wasted upon candidates likely to develop disabilities such as telegraphist's cramp.

I will not deal with other vocations in the Post Office except just to touch upon telephone operating. Many people are mentally and physically incapable of dealing quickly with telephone calls without undue effort, and therefore excessive fatigue. By analytical study it should be possible to exclude such candidates from training, as they would be vocationally unfit. The analysis might, and does to a great extent now in the British Service, determine acuteness of hearing and vision, distinctness of pronunciation, degree of attention, memory for figures, exact visional space perception,

Digitized by Google

restrained nerves, rapidity of hand movement and perhaps, to sum up, well-developed sub-conscious mind.

So far as the Telegraph Department in Edinburgh is concerned, we have a small Committee studying and dealing with the question of Vocational Training, and shortly it is hoped to produce for approval a history card on the lines suggested in the foregoing and a revised syllabus of training in telegraphy.

The time and study to be devoted to this subject will, I am sure, be extremely valuable, and apart from the advantages accruing to the Post Office, there will probably be the discovery of congenial work for the candidate himself. There will be less waste of human material and more economic efficiency.

TELEGRAPHIC MEMORABILIA.

NOVEMBER last saw the opening of the Trans-Continental commercial lines, now in full operation, and owned entirely by the Canadian Government. The manager of the Great North-Western Telegraph Co. (the latter also a Government line) in connexion with this inauguration, recently said :—

"Two commercial wires to Eastern Canada are thus open, but it is only one step towards unification of all State-owned Canadian telegraph services. Prior to the completion of the lines just put into regular service there were no Government-owned commercial telegraph lines connecting British Columbia with Eastern Canada. Neither was there a direct connexion with the system in South-Eastern B. C. nor the Yukon telegraphs, both of which have been Government-owned and operated services for many years. At the time the Canadian Northern Railway was purchased by the Dominion Government, the controlling interest in the Great North-western Telegraph Co. was also acquired, as it was owned by the Mackenzie and Mann interests. Only railway telegraph lines had been constructed by the Canadian Northern across Canada, and now the Government has completed the lines which have been opened.

"Both in Eastern and in Western Canada the Government owns a number of telegraph lines covering more or less extensive areas. The addition of the G.N.W. system considerably increased the Government holdings in Eastern Canada, and assisted to co-ordinate them to some extent. In British Columbia the G.N.W. lines did not reach many points, the chief being Victoria, Vancouver, and New Westminster. In South-Eastern B. C., however, more than 200 points are served by the Government commercial telegraph lines which were controlled and superintended from Kamloops. The Yukon Telegraphs, which reach across the Caribou and Northern B. C. to the Yukon, ended at Ashcroft. In addition to those two systems, the Government, on acquiring the Grand Trunk Pacific, took over that company's commercial telegraph lines extending eastward from Prince Rupert.

"As the main line of the Canadian National Railway into Vancouver touches both Ashcroft and Kamloops, near Jasper Park, the new commercial lines now in commission along the Canadian National link up all the Government telegraphs in British Columbia, and also connect them direct with Eastern Canada."

On Jan. 21 it was announced that the Japanese had taken the important step towards placing the peace of the Eastern world on a firmer basis by renouncing Japan's rights over the pre-war German cables in the Kiaochau leasehold. As is well-known in telegraphic circles these cables are the Chefoo-Tsingtao and the Tsingtao-Shanghai lines laid by Germany and the Tsingtao-Sasebo cable laid by Japan. The latter will be operated by a joint Chino-Japanese Commission. The Japanese have also agreed to hand over to Chinese control, subject to fair compensation, the two wireless stations in the Kiaochau leasehold of Tsinan-fu and Tsingtao, coincidently with the withdrawal of the Japanese troops. One cannot disconnect these arrangements from the decision by Great Britain to return to China the air-base and naval port of Wei-hai-wei.

Readers of these columns will not have been surprised to read the announcement in the daily press of the contract between the German Atlantic Co. and the Commercial Cable Co. by which two new submarine cables will be laid and put into operation between New York and Emden (Germany). The cables will pass *via* the Azores, and the estimated cost is £2,500,000.

The Times states that an overhead telegraph service has been established between Mombasa and Cape Town *via* Tanganyika Territory, Nyassaland and Rhodesia. The rates are said to be cheaper than those of the submarine cables.

The President of Brazil has issued the necessary formalities sanctioning the law which authorises the joining up of railway and telegraph communications between Brazil, Paraguay, and Bolivia.

The announcement that the Postmaster-General of the United States, Mr. Hays, had resigned his appointment in order to accept that of a director in one of the huge Cinema combines at a salary of £35,000 per annum—more than ten times that which he had received as a State official—may possibly lead critics of State services to pause awhile before talking too glibly of the "enormous" salaries of Government officials.

A correspondent writing to the London *Times* recently suggested that with a view to "economy," it is presumed, "all the older postal telegraph and telephone officials should be placed on half-pay at 50 instead of 60," *i.e.*, should be pensioned ten years before the normal period. The scheme has been examined by one or two not unwilling *eligibles* who, while willing to assist in any reasonable scheme of national economy have not yet been able to see how it would prove of financial assistance to the Exchequer to pay a body of experienced officials even half salaries during one-quarter of their recognised official life to do nothing. The writer of the letter pleads on behalf of business men for whom he thinks there would thus be "some chance of getting cheaper postage telegrams and telephones!"

The latest Board of Trade returns show that the Electrical Exports from this country for 1920 and 1921 are respectively £14,272,479 and £17,809,468, or an increase for 1921 of over £3,500,000. Of the items which go to make up this increase, no less a sum than £1,784,057 is credited to the export of Telegraph and Telephone material and apparatus.

The Minister for the Dutch Colonies stated in the First Chamber of the States-General in connexion with telegraphic communication with Surinam, Dutch Guiana, that the Governor of Surinam granted a concession to the Compagnie Francaise des Cables Télégraphiques on Sept. 18, 1889, for 60 years, for the establishment of a connexion between Surinam and the world's cable network by means of one or more cables. Among other matters the concession stipulates that during its duration the holder shall enjoy the preference in all cable connexions associated with the colony of Surinam, and that therefore no facilities can be granted to another cable company without such facilities being first offered to the French company and being refused by the latter.

With regard to wireless telegraphy, the negotiations for the establishment of a wireless station for the needs of Surinam were interrupted through the war, but were resumed at the beginning of 1921, and have now been so far advanced that a solution may be expected in the near future. The Surinam Bauxite Co. has established small wireless stations at Paramaribo and at Moengo, and the Liberty Development Co. one at Albina for its own use and for Government messages, which stations can be taken over by the Government at any time. The stations at Paramaribo and Albina are also open for communication with ships at sea, but not with other fixed stations; and the former is also arranged for communications with French Guiana in the event of cable interruptions.

The German authorities have recently established direct telegraphic communication between Berlin and Riga by means of the Hughes apparatus. It is understood that the line will be served in the very near future by Siemens High-Speed Telegraph System.

The continued unsatisfactory telegraphic communication between the United Kingdom and Italy *via* France has been considerably ameliorated by the diversion of a large portion of the Anglo-Italian traffic *via* Germany, by the medium of the Siemens apparatus. This assistance has been much appreciated by the London office.

Amongst the proposals of the German Government for balancing its Budget an official Note states that telegraph charges have been raised to a figure which apparently works out at about ten marks per word.

Two interesting items came to us from Melbourne last month. The first was the statement by witness before the Federal Parliamentary Committee on the wireless communications to the effect that the adoption of the proposed wireless agreement would practically give the Amalgamated Wireless Co. a monopoly of the wireless service of Australia.

The second was the announcement that the Melbourne-Sydney new Trunk line is operating most satisfactorily as a "composite telephone and duplex telegraph circuit."

We are all children in respect to the extent of our knowledge of the phenomena which surround us, and need feel no shame in admitting our ignorance. In this we may take our places with due humility by the side of Newton. Thus, one might well have wished to have been present at the Christmas lectures by Prof. J. A. Fleming, given before an audience largely composed of young folks at the Royal Institution. Especially interesting to our readers was the fourth lecture on "Electric Waves." Space must, therefore, be spared for the following condensed excerpt from the lecturer's explanation of electrons: –"An electric current reduced to first principles is a drift of the movement of electrons. Electrons are of two kinds, positive and negative. Imagine first the smallest piece of gold that could possibly be seen under a good microscope. That piece of gold would be about the 100,000th part of an inch. If it could be divided up still further into about 2,000 pieces, these would be atoms. An atom, in fact, was hardly discernible in a good microscope.

"Electrons were still further lost in the depths of invisibility. They were each about the 100,000th part of an atom. They are as much smaller

Digitized by Google

than an atom as a particle of dust just seen under a good microscope is smaller than a golf ball. It is now generally considered that a chemical atom is in structure something like a solar system. In the centre is a nucleus built up of positive electricity or electrons, and round it circulate, in rings, a number of negative electrons like planets. These electrons moved about in a piece of copper wire, for instance, at the rate of 60 miles a second, and an electric current consisted of electrons moving, not to and fro, as was their nature, but in the same direction."

Are not we, poor men in the street, under a considerable obligation to those, such as the lecturer, who are prepared to come down to the level of children of a larger growth, and in terms shorn of all abstruse technicalities, without ostentation or fuss, are willing to declare the mysteries of science in the simplest of words ?

Parliamentary sanction is to be sought, probably during the new session by the Postmaster-General, for the acquisition of the underground works of the Pneumatic Despatch Co., Ltd., and maintenance, reconstruction, and use thereof for Post Office purposes.

The C.T.O. staff and supervision are organising a Grand Bazaar in order to endow another bed (this time in a women's ward) in St. Bartholomew's Hospital. Miss Russell, the Chief Supervisor, is already surrounded by an enthusiastic band of workers, and hopes are high for a successful issue of this praiseworthy effort. The Controller, though a mere man, has not, it is understood, been altogether barred from co-operating and thus, the door for the sterner sex, once having been placed ajar, it seems highly probable that male assistance will not be wanting as soon as opportunity offers.

Confirmation of this willingness comes to hand as the proofs of this column come to hand, for a Football Match has been arranged between TS and TSF on Mar. 7 at Ealing. The whole of the proceeds are to be handed over to the Bazaar Funds.

In an interesting report by their special correspondent, the *Electrical Review* summarises some of the telegraph developments due to Latin-American Engineering in 1921. In a much condensed form they may be displayed as follows:—

By a French company the installation of a high-power wireless station was commenced in order to establish communication between Argentina and France.

Work was commenced upon high-power stations at Rio de Janeiro and Belem, State of Para, by the Radiograph Co., of Brazil.

A wireless telegraph service was established between Santiago and Valparaiso in April in view of the interruptions of the telegraph lines during the winter months.

A radio station was completed by British engineers at Puerto Colombia (Republic of Colombia).

A commercial wireless service was established between the Canal Zone, Panama, Colombia, Venezuela and Ecuador. The charge per word from Balboa to Cartagena is 22 cents (gold) if transmitted in Spanish, or 24 cents (gold) if in English or code !

A wireless service was also established between the City of San Salvador (Republic of El Salvador) and the W/T office of the Republic of Guatemala.

A cable was laid across the Alto Paraná, Paraguay, from the vicinity of Encarnacion to an Argentine town near Posadas, thus establishing telegraphic communication for the first time between Paraguay and Argentina.

A wireless station was also set up and is now in operation at Ilo, the southermost part of the Peruvian South Coast.

The Venezuelan Government arranged for the installation of 22 wireless stations. That at Maracay was completed in December, it is believed, while contracts were concluded for wireless towers at San Cristobal, Maracaibo, Puerto Caballo, Coro, La Guaira and Ciudad Bolivar. A wireless school was founded in the capital of Caracas.

In Uruguay the meteorological institute commenced preparations for installing apparatus for transmitting time signals by wireless—the first of its kind in South America—using the system employed during the war with excellent results, the contact passing directly from the pendulum to the antenna. Preliminary trials proved a range of 9,800 kilometres, but at any time signals from the institute may be received at 3,400 kilometres.

A triennial prize, to be known as the "Fondation George Montefiore," is offered by the Association des Ingenieurs Electriques, 31, Rue Saint Gilles, Liege, and will be awarded in 1923. The value of the prize is 21,000f. (about £400), and it is open to electrical engineers of all countries, for the best work done in the three years preceding April 30, 1923. Particulars may be obtained from the secretary.

L'Electricien announces that the Swedish Government is about to construct an extensive network of underground cables between Stockholm and Gothenburg. The length of the line will be over 500 km. It will be the longest line of its kind in Europe, and only exceeded anywhere by that between Boston and Washington, in the United States. To carry out this huge scheme 140 million metres of wire will be needed, 25,000 loading coils, 8 repeating stations, and 300 repeaters. The scheme will require a year and a half to complete.

The *Board of Trade Journal* furnishes some particulars regarding the further enterprise of the Swedish Government in that it has recently approved proposals made in connexion with the use of wireless telegraphy by the Swedish Pilotage Board for co-operation between countries on the North Sea and the Baltic with regard to ice signalling by wireless. The proposals comprise the issue of reports covering the entire Swedish coast from Haparanda to the Norwegian frontier regarding the condition of the ice, to be issued daily in cipher, the key to which is being published in the Swedish "Notices to Mariners." The messages are also to include information regarding wrecks, the withdrawal of lightships, and obstacles to navigation.

The annex to the agreement which was signed on Dec. 6 by representatives of the British Government and by representatives of Dail Eireann on behalf of the Irish Free State, states in part, that (2) a convention shall be made between the British Government and the Government of the Irish Free State to give effect to the following conditions: (*a*) That submarine cables shall not be landed or wireless stations for communication with places outside Ireland be established except by agreement with the British Government; that the existing cable landing rights and wireless concessions shall not be withdrawn except by agreement with the British Government; and that the British Government shall be entitled to land additional submarine cables or establish additional wireless stations for communication with places outside Ireland.

(*c*) That war signal stations shall be closed down and left in charge of care and maintenance parties, the Government of the Irish Free State being offered the option of taking them over and working them for commercial purposes subject to Admiralty inspection and guaranteeing the upkeep of existing telegraphic communication therewith.

Another worthy and well-known figure left the C.T.O. on the last day of January in the person of Mr. F. Skinner, upon reaching the age-limit. A member of the Engineering staff, like his old and respected colleague, the late George Connell, he had been associated with the Central Office practically throughout his career, and leaves behind him many good friends on the commercial staff, who will always remember his willing assistance and ready co-operation. Never man, on his 60th birthday, stepped more blithely and briskly over the door-step of G.P.O. West than did Fred. Skinner. Our best wishes go with you !

Hearty congratulations to Mr. R. E. V. May on his promotion to the class of Assistant Superintendents. Mr. May has always been in the forefront of C.T.O. activities, and it is hoped that his interest in the Sanatorium movement will receive no check with his new responsibilities.

Commiserations with the Western Telegraph Company on the loss of their cable ship *Cormorant* off the coast of South America. This comes at a particularly difficult period in submarine cable history. The deterioration of the war period is far from being overtaken, and at the present moment there is a long list of interrupted or partially interrupted cables between the British Isles and the Continent, all of which are more or less urgent cases. Some of these are Government-owned, and others are the property of private companies.

The cable steamer *Faraday* too, built in 1874 for her owners Messrs. Siemens Bros., has performed her last service for telegraphy after many a stormy and useful journey all over the world. She is to be broken up.

According to information received from Reval the Petrograd—Pekin line of the Great Northern Telegraph Company has been restored as far as Irkutsk.

The following small contracts are open at Adelaide and Brisbane until April 5, says the *Electrical Review*. Twelve adjustable condensers for use on telegraph duplex circuits and Testing and Telegraph instruments. Apply P.M.G.'s Department.

Time—That great mystery of Time ! The illimitable, silent, never-resting thing called Time—rolling, rushing on, swift, silent, like an all-embracing ocean-tide.—CARLYLE.

The Human Mind.—The mind is able to look forward from the solemn ticking of the household clock and can rise to the solemn periods of rolling epochs or ages. It can step into the antediluvian years, or even to the vast mensurations of astronomic cycles and epicycles, the pendulous beat and throb of palpitating planets in their orbits, or the mighty adjustments of of the celestial mechanism, and it is still *in* Time.—PAXTON HOOD.

J. J. T.

Frame's Travel Office announce some very reasonable inclusive trips to the Isle of Wight, commencing at Easter. It will be seen that £5 5*s.* 0*d.* covers railway fares and a week's hotel accommodation and motor excursions.

The
Telegraph and Telephone Journal.

PUBLISHED MONTHLY IN THE INTERESTS OF THE TELEGRAPH AND TELEPHONE SERVICE, UNDER THE PATRONAGE OF THE POSTMASTER-GENERAL.

Editing and Organising Committee - - - J. STUART JONES. JOHN LEE. J. J. TYRRELL. W. A. VALENTINE. J. W. WISSENDEN.

Managing Editor - - W. H. GUNSTON.

NOTICES.

As the object of the JOURNAL *is the interchange of information on all subjects affecting the Telegraph and Telephone Service, the Managing Editor will be glad to consider contributions, and all communications together with photographs, diagrams, or other illustrations, should be addressed to him at G.P.O. North, London, E.C.1. The Managing Editor will not be responsible for any manuscripts which he finds himself unable to use, but he will take the utmost care to return such manuscripts as promptly as possible. Photographs illustrating accepted articles will be returned if desired.*

VOL. VIII. MARCH, 1922. No. 84.

TELEPHONE DIRECTORIES.

ONE result of the introduction of a new tariff involving the calculation of trunk charges strictly on the basis of Distance is the abolition of the old trunk exchange area, now become a term without meaning. It follows that there remains little justification for grouping subscribers in the telephone directories within quasi-geographical boundaries which no longer exist.

The Post Office has under consideration the re-arrangement of the grouping in the provincial directories on broad and comprehensive lines. The telephone district in the majority of cases must remain the unit for each sectional directory, and the collection of subscribers into one alphabetical group for each district presents itself as an attractive end to be achieved. This standard is not likely to be uniformly realised, and in some cases local conditions will probably lead to the retention of more than one grouping. Local opinion will be consulted, and the friendly aid of the Telephone Advisory Committees in provincial towns will be enlisted to ensure a satisfactory arrangement.

There are always those who object on principle to all change, but those who cling to the retention of the present system will, we think, find some difficulty in defending it. The trunk areas have no definite geographical basis. They were originally created, as most of our readers know, to delimit the activities of the late National Telephone Company, and it was found expedient to employ them as the standard unit for grouping subscribers in the directories. But they have many drawbacks. Two or more boroughs are often included in one area, and difficulties of nomenclature at once arise. Probably a Newark subscriber does not see why his area should be called the Grantham area, a Runcorn subscriber complains that his name has to be sought in the Widnes area, and so on. Such objections should largely vanish with the broader grouping.

Where a large city (such as Liverpool, Manchester, Glasgow or Birmingham) is the preponderating constituent of a district, there should be little opposition to the arrangement of all the subscribers in that district in one alphabetical group. Where a district stretches over several counties some ingenuity may be requisite to find suitable and acceptable titles for the groups, but we imagine that to group, for example, such places as Grantham, Boston, Spalding, Skegness, &c., under a generic title such as South Lincolnshire would do violence to no local susceptibilities. It may be of interest to observe that Sweden, which is often held up to us as a shining example, arranges her telephone subscribers in six volumes, roughly, according to provinces, each volume containing one alphabetical group. It would, however, be impossible to adopt any strictly geographical grouping, such as by counties, in this country. To separate Manchester from Stockport, Liverpool from Birkenhead, and Birmingham from its Worcester and Staffordshire subscribers—to name no other cases—is not to be thought of.

One objection to the proposals we hear of is that they will necessitate wading through an inordinate number of "Smiths." It may be observed that no provincial directory in any way approaches the size of the London book, where the Smith problem has not heretofore been urgent. On the other hand, it is surely easier, if, for instance, you want to ring-up a Smith in some small town in the West Riding, to run through a column or two of Smiths in a West Yorkshire directory and be sure of finding him there, than to search either in an index or else through a Huddersfield, Halifax and Bradford string of Smiths before finding the one you desire.

HIC ET UBIQUE.

THE establishment of an Institute of Public Administration is an historic event in the history of the Civil Service. The objects of the Institute are to provide in every way for the maintenance and furtherance of the high ideals of the Civil Service and of public services generally, to develop the professional worth and standing of public servants and provide a means whereby education and training of Civil Servants may be furthered. The Institute will consist of Fellows, Members and Associates. All members of the public services are available for election as Associates. The annual subscription will be 10*s.* 6*d.* Members need to have certain qualifications in the nature of having performed executive or administrative work for three years, but Associates are eligible to election as members by passing an appropriate examination. The Fellows will be a very carefully selected body of members who have given distinctive service in the administration of important branches of the public service or who have made a notable contribution to the furtherance of the professional interests of Civil, Municipal and other public servants. A quarterly journal will be published and will be sent to all Fellows, Members and Associates. It is a venture which is of the utmost importance to all members of the Telegraph and Telephone Establishments.

MR. JAMES SMYTH (President of the Dublin Wireless Club and G.P.O. official) gave a lecture on "The Wonders of Wireless" on Jan. 20 at the College of Science.

Digitized by Google

According to FREEMAN'S JOURNAL "he described the improvements which followed (the invention of wireless), comparing what is known as the tuned *ariel* (*sic*) with the plain A system. He spoke also of the various improvements in the reception, starting with the *co-hearer* (*sic*) and going on with the crystal, and coming to the latest improvements which had revolutionised wireless with the "valve."

Apparently the revolution led to the death of the co-hearer, presumably from valvular disease of the heart. American readers may pray for a similar fate for his trans-Atlantic kinsman, the "rubberneck."

WE learn that the Manchester telephone district has reached a total of 50,000 stations, being the first provincial district to do so. Liverpool and Glasgow, in the order named, are following hard on the heels of Manchester.

OF course, this achievement pales beside that of Toronto which has reached the 100,000 standard, with mayoral luncheons and other suitable celebrations. Toronto claims to be the best developed city in Canada with 1 telephone for every 5 inhabitants.

SOME unknown genius in the Postmaster-General's department, says the *Daily Express*, must have spent a holiday on Olympus. The name for the new Stratford E. telephone exchange is to be "Maryland." This is inspiration.

Whisper it softly—"Maryland"! You can almost smell the new-mown hay; you can see the dear old farm standing back among the elm trees, cows returning in single file to the sheds across the meadow, and Mary, her sleeves rolled up, standing on tip-toe to reach a rambler rose from the trellised bower beside the door. . . .

"Number engaged!" What matter? Who would disturb the peace of "Maryland"?

Our own associations with Maryland are somewhat different. So far from recalling the smell of new-mown hay, it brings back memories of holidays in France and the odour of a native tobacco of astounding properties.

RESTITUTION of social rights, says a writer in *Truth*, might prove a case well established against the telephone, because it as often avoids as confirms its responsibilities.

What lies the instrument transmits, what shufflings, and there could be well filled a list for service marked "Also rangs" to indicate messages from the undesirable who have—Providence be praised—caught you napping and "not to be disturbed."

We think the writer means that the subscriber and not the telephone avoids its responsibilities. But how much easier to say "I was unable to get you on the telephone" than to confess that one purposely omitted to ring up!

A WRITER in the *London Mail* says:—

I think it is about time somebody protested against the charges made for the use of the telephone in restaurants where the price of food is, to put it mildly, on the stiff side. Not long ago I was charged over £2 for a very modest lunch for two at the Ritz Grill-room (no meat, wine, liqueurs, cigars or costly delicacy), and immediately after lunch had to pay 4*d*. for the use of the 'phone. It wasn't the trifling sum that annoyed me, but the thought that after a considerable profit had been made out of me over the food, an additional few pence were raked in over something that in most Continental and American hotels is free.

We express no opinion on the ethics or the wisdom of the hotel people's policy. What strikes us chiefly is the indignation with which the diner is filled at being charged 4*d*. for a 3*d*. call and the equanimity with which he pays £2 for (if his memory is accurate) what he seems to suggest was a few shillings-worth of food. But this is characteristic of the attitude of the public to telephone charges generally.

OUR casual peregrinator seems to have met with similar cases for he sends us

THE BALLAD OF THE DISGUSTED DINER.

I met with a wight whom I assumed
To be one of your men-about-town,
(Such as lady-novelists term "well-groomed,")
And his well-groomed brow wore a frown.

"Now out upon it and fie for shame
That I should be rooked, pardie,
In London Town!" and in words of flame
He unbosomed himself to me.

He unbosomed himself in chosen words,
And his choice was wide and free!
Of his flowing discourse a goodly two-thirds
Was unfitted for poesie!

"I entered a lordly resort whereat
Great dukes and fair dancers dine,
And where aristocrat and theatrocrat,
To shed distinction combine.

And lightly, lightly did I eat,
And lightlier did I drink,—
No generous wine or *chartreuse* fine,
Ever crossed my goblet's brink.

Not on ortolan or on marzipan,
Or plovers' eggs did I feast;
No maraschino enlivened my beano—
But I heeded this not in the least.

For all around sat damsels well-gowned,
Priceless and peerless and "smart";
And scions of peers mixed with profiteers
In a way that gladdened my heart.

My soul to the stars soared above cigars;
I waved *Coronas* away,
And, contented in mind, my head I inclined:
"Ho, varlet, the bill, I say!"

With shirt-front clean and majestic mien,
There came—do I speak of Waiters?
Nay, one of the line of the Byzantine
Panhypersebastocrators.

He brought my bill and was'nt unwilling,
Its incidence to expound;
"No meat, twelve-and-six; no vine, thirty shilling,
No cigaro—that vill be two pound."

I came to earth; but my money's worth
I had had in reflected glory,
Then I asked for the loan of their telephone,
But that is a shameful story.

What think you, what think you the brigands charged?
What think you they charged to me
For a threepenny call from a cabinet small?
Even four pence instead of three!

I ask not wine, I ask not meat,
I ask not dainties dear:
For the two pounds or three which they charge to me,
But, good lack! when they profiteer

When they profiteer by a penny clear,
For the use of a telephone booth,
Then Faith seems dead and Hope is fled,
And vain are Love and Truth."

W. H. G.

OBITUARY.

WE regret to record the death of Mrs. Moorhouse, the wife of the District Manager of Telephone, Reading, which took place very suddenly from hemorrhage following a seizure. Much sympathy is felt for Mr. C. F. Moorhouse and his daughter and sons in their great bereavement. Evidence of the respect in which the deceased was held was forthcoming, when the funeral took place at Caversham. A large number of people were present, including representatives from the various departments of the P.O. telephones.

MR. H. J. E. BOOTH.

WE regret to record the death of Mr. H. J. E. Booth, Managing Director of the Electrophone Company. Mr. Booth had been the leading spirit of the electrophone system from its inception, and its present development is due chiefly to his efforts. The Post Office was represented at his funeral by Mr. G. F. Greenham, Assistant Superintending Engineer.

Digitized by Google

(*e*) the amount of unoccupied time due to absence of traffic ;
(*f*) the number of RQs, that is to say the number of irregularities due to incorrect number of words, faulty manipulation, etc., detected by the receiving telegraphist and requiring correction by the sending office ;
(*g*) the time taken to correct defective messages ; and,
(*h*) the amount of stationery and the number of coils of slip and printing rolls used.

These various values were brought as accurately as circumstances would allow into a sharp focus for each system by ascertaining the cost of dealing with a telegram-unit.

It will perhaps be interesting to run rapidly over the ground of the enquiry and note the salient features so far as the working of the machines is concerned. In the four weeks the typewriter keyboard circuits to station A. disposed of 110,000 telegrams with a total of 6,150 operator-hours, whereas 95,700 telegrams were transmitted directly by hand to station B. with a total of 6,720 operator-hours. That is to say, machine manipulation had a superiority of 14.9 per cent. in output with 8.5 per cent. less staff, or alternatively with equal staff the type-keyboards gave an increased yield of 25 per cent.

The records of unoccupied time due to absence of traffic were admittedly the least trustworthy of the trials. They are correct as far as they go, but periods of two minutes or less went largely by default, and there is no doubt whatever that it is the large accumulation of the small and unrecorded intervals that provide the wide margin of elasticity for busy periods—when thy come. The amount, however, actually recorded during the month was 529 channel-hours on the circuits operated by machine and 383 on those worked direct by hand.

Let us now glance at the RQs—they are the snags and bugbears of telegraphy. I should first point out that with the typewriter keyboard circuits a perforated slip is employed, and the operator goes ahead with his work and gets in advance of the automatic signalling apparatus, so that there may be several messages awaiting transmission on the slack slip hanging from his keyboard. It is therefore obvious that when he desires to put a question to the distant office his enquiry in ordinary course has to wait its turn on the slip. Similarly at the other end of the line, when the reply is perforated, the machine has first to run off the slack. In this manner precious minutes go by, and the telegrams affected have to wait. In the case of the Baudot circuits, the question put is instantaneously received at the distant office. During the month covered by the returns, 8,952 RQs. (9 or one in 12.3 messages) were recorded at the machine keyboards and 7,130 (or one in 13.4 messages at the Baudots, an advantage of about 9 per cent. in favour of the latter. The average time taken to correct defective messages was 8.7 minutes at the first-mentioned circuits, and 5.1. minutes at the second.

I have dealt with only a few of the headings which I gave above, and have endeavoured to throw into relief strong features of type keyboard operating, but I may say that the trial, favourable as it was in many respects to keyboard-operating, was not wholly conclusive that that system was the more economical. All theoretical traffic considerations are in favour of the type-keyboard system, as compared with hand-signalling, despite the heavier cost of the keyboards and transmitters. The freedom of typing, one would think, should result in greater output than is possible when operating is restricted by the Baudot cadence, but nevertheless the disappointing truth is that the periodical returns of output do not yet indicate a marked superiority on the part of the type-keyboard system. Endeavours are being made to determine the factors which prevent the theoretical advantages of the keyboard from being realised, but until these causes are located and removed where possible it would be premature to undertake much development of keyboard working, though some development is necessary for purposes of experience.

The Post Office, by adopting the recommendations of Captain Norton's High-Speed Committee some years ago, definitely decided upon the multiplex system, as against the automatic high-speed system, for its main telegraph routes, and experience since then has not shown its decision to be wrong ; but there is no finality in such matters and it behoves us to keep an open mind on any new or improved system, whether multiplex or automatic, which may appear in the future. We must not overlook, for example, the Siemens-Halske apparatus, which is developing considerably on the Continent, or the new Creed apparatus which possibly may affect our views as to the superiority of multiplex.

The evolution of the multiplex should clearly be in the direction of page or form printing. The pasting of Baudot tape on a form is a rather messy operation, and the result is not a pretty form of telegram. The continuous roll of paper used on the Western Electric provides a message form which is hardly in keeping with the dignity of the British Post Office. There are no doubt at present difficulties in the way of providing a satisfactory and economical method of form feeding, but it is to be hoped that these difficulties will be overcome in time.

The Wheatstone system, supplemented by Creed reperforators and printers, holds at present pride of place as the standard system for the transmission of Press messages from one town to several other towns simultaneously over news wires. The perforated tape received at any one of the towns of reception can be put through a printer, if the message is for local delivery, or it can be run through a Wheatstone transmitter if the message is intended for a town not connected with the main circuit. As the Creed printer normally prints on one tape only and, as the retention of top or office copies has been abolished, it is obvious that gumming a printed Creed slip on a suitable form and delivering it to the addressee, provides a rapid method of dealing with received Press traffic. When multiple Press messages do not exceed three, three printed slips are obtained by using triplicate tapes, but where several copies are required, as they are at Manchester, a "Victoria" or "Roneo" Copier can be employed. The Creed system is thus very expeditious and very labour-saving.

The possibility of providing similar facilities for Press traffic by means of multiplex instruments, which would necessarily have to be of the typewriter and transmitter type, has, it is understood, received some attention from the engineering department, but the position as regards the supply of apparatus is hardly sufficiently advanced to make progress possible. It is a subject, however, which calls for serious study.

Since the War steps have been taken to replace by a lamp signalling pattern the old type of telegraph concentrator which had many objections from a traffic point of view. The improvements which have been effected with the new pattern are as follows :—

(1) Greater reliability of calling signals ;
(2) Easier operating ;
(3) The clearing signal from the working set operates at two points (*a*) at the switchboard ; (*b*) at the working set ;
(4) A reduction in instrument room noise, the sets being so wired that, when telegraphists send, marks are not received on the home sounder ;
(5) Sets may be worked over Morse double current or the condenser impulse system ;
(6) Day and night concentration may be provided for on one switchboard except at a few large offices ;
(7) Less table space required.

It is hoped that out of about 70 concentrators throughout the country about half will have been replaced by the new pattern switchboard by the end of next year. It is clear, however, that in the past concentrator switch working was overdone and it is certain that many of the concentrators will be abolished, as the advantages of concentration in these cases are outweighed by the cost of switchboard operating, capital cost and maintenance charges of the concentrator. Even the lamp-signalling concentrators, similar as they are to telephone switchboards, seem very suitable for replacement by automatic switching apparatus so as to avoid the cost of manual operating. An automatic concentrator which appears to meet traffic conditions admirably has been designed by the Engineer-in-Chief, and an installation is being provided experimentally at Leicester.

Next there is the addressing stage of telegrams to be considered.

The initial operations in dealing with telegrams for delivery when they reach the addressing stage are to date-stamp and number the forms. Hitherto the general practice has been to perform both operations separately with different instruments, and at the larger offices it is necessary to staff both the date-stamping position and the numbering position. Trials have been proceeding with a view to combining both operations and it is found that, with the addition of a simple die-plate fixed to the frame work of the ordinary pull-over numbering machine above the serial number printing position, it will give a simultaneous impression of the name of the office and the date as well as print the serial number. No alteration is made to the numbering mechanism and, apart from the provision of fitting the die-plate and the increased size of the pad which takes the blow, little expense is involved in obtaining this comparatively small but effective and economical improvement.

Finally I come to the stage of conveyance of telegrams from the office to the address. The system of delivering telegrams by telephone is gradually developing, and, with the increase of the use of the telephone by the public, we may expect that the proportion of telegrams delivered by telephone will increase considerably. But there will always be a large proportion which will require to be delivered by hand and the question of mechanical aids to increase speed of delivery and to economise staff costs is as worthy of attention as other parts of the telegraph service. The obvious method is a larger use of bicycles, but, so far, the use of bicycles has been restricted and, generally speaking, the number of bicycles in use is not nearly so large as it might be if speed of delivery and economy of messenger force were alone considered. The recent introduction of the system of delivering telegrams in pre-arranged walks has led to the question of the use of bicycles being looked into more fully than has hitherto been the case, and as a result the number of bicycles is being increased.

In conclusion, I may perhaps say that I have tried in this paper to indicate in a broad way how the improvement of the telegraph service by means of machinery appears from a traffic point of view. There are many fields of telegraph traffic service and economics which are far from being fully explored or have not been explored at all, for the telegraph service is behind the telephone service in traffic study, but I hope that I have said sufficient to show that traffic officers are alive to the position and that they are making progress as quickly as circumstances will permit.

HOLIDAYS.

THE annual party, which has hitherto visited the Bernese Oberland under the guidance of the late Canon Horsley, will be conducted in future by Mr. Fewtrell, of the Post Office Engineering Department. Anyone desirous of joining this year's party, leaving London on Whit-Monday, June 5, at 2 p.m., should communicate with Mr. J. W. Fewtrell, Engineer-in-Chief's Office, G.P.O. West, E.C. The cost, including railway fare, hotel accommodation and gratuities, is about £16 10*s*. for 15 days and about £21 5*s*. 0*d*. for 22 days.

MODERN WIRELESS TELEGRAPHY AND TELEPHONY.

BY F. ADDEY, B.Sc., M.I.E.E., FELLOW I.R.E.

(*Continued from page* 69.)

Continuous Waves.

In the various transmitting systems described above the signals are produced by setting up a succession of groups of oscillations in the aerial, the amplitude of the oscillations in any particular group, and therefore, of course, the amplitude of the waves in each of the resulting wave-trains, gradually dying away. A long or short series of such groups of oscillations produces a dash or a dot respectively. During recent years several systems have been developed in which, instead of these detached groups of oscillations, a continuous oscillation of constant amplitude is produced in the aerial during the whole duration of a signal. These systems are known as "continuous wave," (C.W), systems. They have considerable advantages over the earlier systems in which detached trains of waves were used, and all these latter systems are now practically obsolescent, at least as far as large stations are concerned.

There are four methods by which continuous waves can be generated. Alternators have been built by which the necessary high-frequencies can be directly produced. Although such alternators have to be of very special design to meet the peculiar conditions of the service for which they are intended, the principles of their action are the same as those involved in the action of the low-frequency alternators used in ordinary electrical practice. One terminal of the alternator is connected to the aerial, and the other terminal to earth. When the signalling key is depressed the alternator is excited, and causes a steady high-frequency current to flow up and down the aerial, with the consequent radiation of waves of constant amplitude.

In other C.W. systems alternators are employed, but the high-frequency current is not produced directly by the machine. The alternator generates a current at a frequency considerably lower than that required, and by suitable devices, the action of which is too complicated for description in articles intended for the general reader, the frequency of this current is multiplied till the desired high-frequency is reached.

The remaining two systems are those in which the high-frequency currents are produced by the use of an arc (Poulsen system), or by a valve.

Poulsen System.

The Poulsen system is based on a discovery of Duddell that if a condenser C (Fig. 27) and an inductance L of suitable magnitude be connected in series as a shunt across an arc, the direct current supply to which is taken through inductance coils L_1, L_1, a steady alternating current will be set up in the shunt path, the frequency of which is determined by the value of the inductance and capacity in that path.

The production of this alternating current depends on the peculiar manner in which the voltage across the arc changes when the current through the arc is altered. The relationship between these two quantities can be shown by a curve—the characteristic curve of the arc. Such a curve is shown in Fig. 28, from which it can be seen that the voltage across the arc increases as the arc current falls, and becomes less as the arc current rises. Suppose the arc to be burning, and then the condenser-inductance shunt joined across it. The condenser will at once begin to be charged by the potential difference which exists across the arc, but the inductance coils in the leads to the arc prevent any sudden alteration in the current taken from the source of supply. (The reader will recollect that inductance in electrical matters corresponds to mass or inertia in mechanics. In just the same way that the speed of a moving train, or of a spinning fly wheel, cannot be suddenly changed, so the value of the current flowing in a circuit of high inductance cannot be suddenly altered.)

Consequently, as current flows into the condenser to charge it, the current through the arc will fall by an equal amount, the total current from the supply remaining the same. Directly the current through the arc falls, the voltage across the arc will rise, as is shown by the characteristic curve.

Consequently, the current being driven into the condenser will increase. This will cause a further fall in the current through arc, resulting in a further increase in the potential across its terminals. These actions will continue till the arc current falls to zero. At

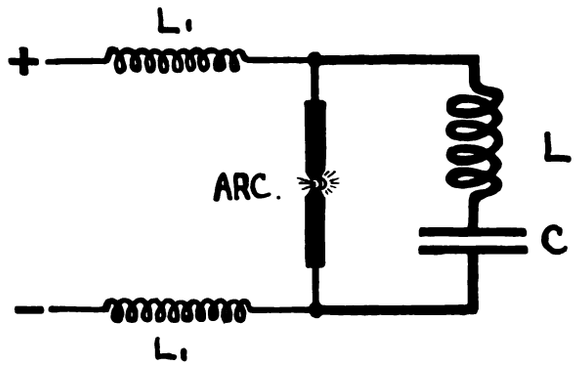

FIG. 27.

this instant the condenser will be charged to the voltage of the supply itself. The current into the condenser will not, however, immediately stop, as the inductance L joined in series with it across the arc will cause the current to continue flowing for a short time. The action is similar to that already explained in the case of the oscillatory discharge of a condenser.

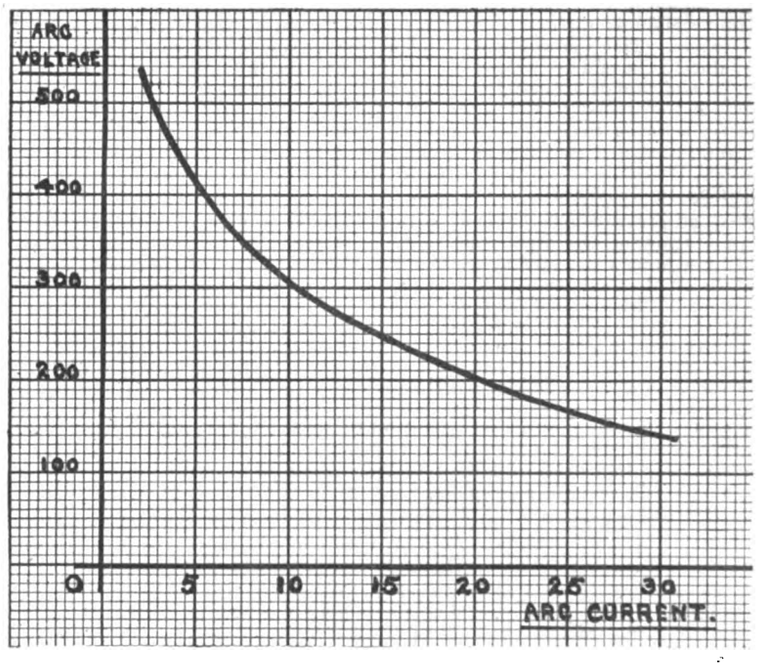

FIG. 28.

When the current into the condenser finally stops the condenser is charged to a voltage somewhat higher than that of the supply to the arc. The arc now re-ignites, and the condenser begins to discharge across it. Directly this happens, since the discharge current from the condenser is now added to the current which flows through the arc from the supply, the total arc current is increased and therefore the voltage across the arc will fall, as shown by the characteristic curve. The arc voltage opposes the discharge of the condenser, and so, when this opposing voltage is reduced, the discharge of the condenser takes place more readily.

Digitized by Google

Every addition to the total arc current by current from the condenser causes a corresponding further drop in the arc voltage and therefore allows the condenser to discharge more easily. This will continue till the condenser is completely discharged. The inductance L in series with the condenser will then again exert its effect and cause the current to continue flowing, with the result that the condenser is now charged in the reverse direction. The condenser then discharges and is re-charged in the same direction as at first, and these actions continue indefinitely. Thus, as long as the supply of current is kept up to the arc, an alternating current will flow in the shunt path LC.

(*To be continued*).

LONDON ENGINEERING DISTRICT NOTES.

Retirement of Mr. A. E. Cooke.

THE London Engineering District lost one of its noteworthy veterans on Feb. 27, in the person of its principal Clerk, who retired from active service after 45 years' service in the Post Office. Mr. A. E. Cooke came to London from Birmingham in the autumn of 1901 to take charge of the clerical force in the newly-formed Metropolitan Central District. These were the opening days of the Post Office telephone enterprise when London was divided into three engineering districts. Progressive development reduced these to two, and eventually to the one London engineering district, and on every stage of its growth the distinctive personality of Mr. Cooke was impressed as a prominent feature. His many friends wish him happiness and good health for many years to come.

Development.

The gradual lengthening of the days as the year progresses turns the thoughts of many to the cultivation of the soil and the rearing of plants. The quiescent period when nature is relied upon to improve the soil conditions with the aid of rain, frost and wind, is nearly over, and the time for man to take direction is rapidly approaching. In full time the rich harvest will be reaped. There is one type of plant cultivation that does not permit of rest during the sunless winter period. It involves the frequent turning over of the soil and the more frequently this operation is performed the more rapid is the spread of the roots and branches. In favourable trade winds the fruit forms freely, and if cultural instructions are followed carefully, is evenly distributed. The astute readers of this JOURNAL will have already guessed that it is the telephone plant that is referred to, and, therefore, at this stage metaphor will be dropped.

Good progress is being made in the provision of plant to meet the future requirements of the vast population in the London engineering district. Very few areas exist now in which serious difficulty is experienced in giving service on demand or within a short period thereof, and the day is fast approaching when it will be possible to accept orders in any part with knowledge that they will be completed in a few weeks at most. The most serious difficulty to be overcome is the provision of exchange plant in certain congested areas. Delay in the completion of exchanges reacts very unfavourably on the progress of the external work and makes the outdoor operations more complicated and expensive. The difficulties attendant on a settlement of the problems arising out of the advent of the automatic system are very real, and a false step might have disastrous results, but it is hoped that a way through the difficulties will soon be discovered, and certain much-needed exchanges will materialise rapidly.

It is doubtful whether any organisation or firm has such difficult problems to solve as are met with in connexion with the telephoning of large cities, and certainly there is no more difficult case to deal with than London.

The selection of sites for new exchanges is not the least of the difficulties. It is rarely that anything suitable can be found at the ideal centre, and if it can be the cost may be so high as to make it necessary to seek something further afield in the hope that the additional-line costs consequent on a site being out of centre may be more than balanced by the lower purchase price. One of the most important considerations that has to be investigated is the means of access for the line plant. In the heart of London a good site from other points of view may be found and yet be useless because the many ducts and cables that have to be led to it cannot be accommodated in the congested and narrow surrounding streets.

A very fine site has now been purchased in Wood Street, Cheapside, for a 30,000-line exchange to relieve the present London Wall area. One has only to look on the road and pavement surfaces around this to see that some careful planning will be necessary, combined probably with some deep tunnelling, to avoid the existing obstructions and lead-in the required 70,000 odd pairs of wires.

In designing a new exchange building, consideration is given to the possibility of accommodating engineering stores and workmen's quarters, if such are necessary—and they invariably are. Space outside P.O. buildings is difficult to obtain, generally expensive, and rarely meets the full requirements.

In the City and Centre sections there are as many as 2,410 workmen and 110 inspectors to be considered. Some of these must in virtue of their duties be housed in the exchange buildings themselves, but, although desirable, it is not absolutely essential that the remainder should be. The nearer the men's headquarters to their work the more effective work can the men perform. It is a nice problem to decide how the workmen shall be grouped so as to obtain the maximum output. Consider, for example, subscribers' apparatus-fitting work. Should all the fitters in a section work from one headquarters or should there be more than one fitting office, and if so how many and where should they be located? Each section must be considered on its merits, and allowances made for the length of journeys and the travelling facilities. It must, of course, be advantageous to have all the office work centralised. Such problems as these keep the minds of the administrative officers from atrophying.

Extension of London Engineering District Boundary.

On Jan. 1 the Ilford and Woodford Exchange areas were added to the London engineering district. The addition of this portion of the old Ilford section did not involve the transfer of the sectional engineer to London. This is unfortunate for London, but fortunate for Exeter, where Mr. Wise is being transferred. Mr. Wise was under the old conditions an agreeable neighbour: the best wishes of his London colleagues go with him in his new field of activities.

Instructional Films.

Most people who claim to possess a fair degree of intelligence are excessively bored at the usual cinema entertainment. Sooner or later those who make a living from moving picture entertainments will find that the public is surfeited with inanities and will give their attention to providing more intellectual fare. The cinema offers a splendid means for educating the masses and at the same time entertaining them.

An example of what can be done was given at the Institution of Electrical Engineers' meeting on Jan. 12, and at the I.P.O.E.E. meeting on Feb. 8. At these meetings the theory of the Audion or thermionic relay was explained by the aid of moving pictures. The behaviour of the electrons and the flow of current in the associated circuits was shown in such a clear manner that those present will probably carry a mental picture of the phenomena about with them for the rest of their lives. The application of the Audion to wireless and cable telephony was demonstrated in a similar manner.

One interesting reel showed the 200 odd parts of a C.B. telephone spread out on a table, and the gradual assembly of the parts apparently without human aid. The films were prepared in the Western Electric Co.'s Research Department, U.S.A., and it was due to the courtesy of this firm that the members of the I.P.O.E.E. were enabled to see them. The films are, of course, prepared by taking innumerable photographs either of drawings or apparatus, each differing very slightly as regards the position of lines or parts from the preceding one.

The same methods could be adopted to show the action of say, automatic telephone exchange plant, and help students over the initial period of their studies of a very difficult subject. Films showing activities of the Post Office should be very instructive to the public and remove from their minds much of the misconception that now exists.

New Exchange at Kilburn.

The building hitherto in use at Kilburn as a Fire Brigade Station has now been purchased by the Department for use as a telephone exchange, and the Office of Works is very busy carrying out the necessary structural alterations which will render the building suitable for this purpose. The exchange will be of the No. 10 type, and will have a capacity of approximately 2,000 lines. The whole installation will be carried out by the Sectional Engineer with his normal construction staff. At a later date a much larger exchange will be installed in a new building to be erected on a piece of land at the rear of the existing building.

The provision of the temporary exchange will afford much-needed relief to the Hampstead Exchange.

Temporary Bishopsgate.

Before this issue appears it is expected that the temporary Bishopsgate Exchange will be opened. The equipment is located in the Clerkenwell Exchange building, and is, in fact, the equipment which was used to give temporary service to Clerkenwell subscribers while the main Clerkenwell Exchange was being installed. The capacity of the equipment is approximately 1,500. A site for a large permanent exchange to accommodate 10,000 lines has been acquired in the Bishopsgate area, and it is hoped that a start will soon be made with the building operations.

Electrophone Service.

Reference has previously been made in these notes to the improvemen in the Electrophone Service occasioned by the introduction of some

Digitized by Google

experimental amplifying units. The results were so satisfactory that it was decided to extend their use, and recently 10 sets were completed. The amplifiers are inserted at the Electrophone Exchange end of the music lines, and not only does the amplification improve the hearings to individual subscribers, but it enables a far greater number of subscribers to be connected to one line than was possible under the old conditions.

Despite the fact that the exchanges are staffed with members of the gentle sex, and that none are employed in the test-rooms, yet far more jumpers are seen in the latter than in the former.

LONDON TELEPHONE SERVICE NOTES.

London Telephonists' Society.

THE fifth meeting of the session was held on Wednesday, Feb. 8, when Mr. Pink took the chair. Two of the prize-winning papers submitted in the yearly competition were read. The papers, which were a complete contrast to each other, were much enjoyed. The first one heard, "Toll Exchange from a Supervisor's point of view," was by Miss A. E. Knight, Supervisor, Toll Exchange, and it was read by Miss Johnson. It gave most interesting particulars of Toll exchange before, during, and after the opening. Mr. Dive and Capt. Berry took part in an animated discussion. Mr. Pink, in thanking Miss Knight for her paper, referred to the interesting discoveries, reported in the daily press, which were made when the Toll ducts were laid, the workers, when burrowing under London, coming across stonework suggesting an old Roman bath, foundations of a building that may have been a temple of Diana, and a portion of the old Lud Gate.

The second paper, by Miss E. J. Turner, Telephonist, Mayfair Exchange, was entitled "A stage in the life of a Private Branch Exchange Telephonist." Miss Turner, in her own inimitable way, told her audience how she kept her subscribers in order, and how, by the force of example, she lured wrong-doers from the paths of slackness, and instilled into them a lively consciousness of how far they fell short in their official lives of the high ideal attained by Private Branch Exchange Telephonists. It was sometimes curiously reminiscent of Ethel Monticue in "The Young Visiters," as, for example, when the mysterious "Mr. Edmund X," on hearing that Miss Turner was leaving his service, gave her —"a kind look!" It was an entertaining paper, and, judging from the laughter which it provoked, was much appreciated by the audience. Miss Turner promised to make some further revelations later, to be entitled, "Miss New-Departure, and how she met her Fairy Godfather!" This will no doubt be looked forward to eagerly by those who were present at her first paper.

At the next meeting, which will be held on Mar. 8, the remaining prize papers, and essays to be judged by the audience will be read, and the prizes distributed.

* * * *

The King's Levee.

Among those attending the Levee held by His Majesty the King at St. James' Palace on Feb. 14, was the Controller, Major G. F. Preston, C.B.E.

* * * *

Hospital Saturday Fund.

The annual general meeting in connexion with the Telephone Staff Hospital Collections, for the Hospital Saturday Fund, was held on Monday, Feb. 6. Mr. Reed, the Secretary of the Hospital Saturday Fund, being present. Unfortunately Mr. Preston, who was to have taken the chair, was ill; and a message was sent to him from the meeting, expressing regret at his absence. Mr. Valentine substituted at very short notice, and was warmly welcomed. Miss Reekie (Joint Hon. Secretary) read the report for the year, which was a highly satisfactory one, each department showing an increase on its previous year's collections. The total amount collected was £1,871 1s. 11½d.—an increase of £400 over last year's collections. As the Chairman pointed out, this was very creditable, having regard to the many other funds to which the members generously contributed, and to the tragically diminishing bonus. It must not be forgotten, though, that the goal to be aimed at is £2,000, and a special appeal is made to all concerned to keep this amount in mind and to endeavour to reach it this year.

Miss Cox gave some interesting facts about the eight letters issued for Sanatorium treatment. She was able to report that the majority of the girls who had undergone the treatment had made a complete recovery, and were back at work.

Mr. Valentine, Mr. Stirling, Mr. Reed, and other speakers, in referring to the figures for the year, emphasised the human element underlying this work, and, by the alchemy of sympathy, transmuted dull statistics into living facts.

The office bearers and delegates for the year 1922 were appointed, and Mr. Preston was unanimously re-elected Chairman. The meeting closed on a happy note, when Miss Reekie, on being, with Miss Wormald, re-appointed for another year, exclaimed naively:—"We should have been *so* disappointed if you had not re-elected us"! Such enthusiasm, that "genius of sincereity," for what is undoubtedly a very arduous task, is as refreshing as it is rare, and should be an incentive for the present year's work to all who take part in it.

Langham Choral Society.

The performance of "Elijah" at Queen's Hall on Jan. 24 was an artistic success. The choir sang better than ever, a specially noticeable feature being the excellent balance between the male and female voices. The third and last concert of the season will be a performance of "Hiawatha," on Tuesday, Mar. 28. The three parts of the work will be sung, and those who have not yet attended any of the Society's concerts will be well-advised to make early application for tickets for this occasion. The concert secretary, Mr. W. R. Child, will be pleased to send posters, handbills, and tickets to anyone applying to him at West District Contract Office, 102, Dean Street, W.1.

London Telephone Service Swimming Association.

The annual general meeting of the L.T.S.S.A. was held on Monday, Feb. 6, Mr. E. A. Pounds, presiding. The Association decided to put up for competition a shield to be held for a year by the affiliated club gaining most points in specified events at the annual galas. Owing to the large number of competitors at the last gala, it was decided to hold two during the forthcoming season, one for individual events and the second for team races. The Association is in a very healthy state, having 21 clubs affiliated to it with a total membership of over 1,200. Over 300 girls have learnt to swim since the formation of the Association two years ago. Miss Temme, of the Trunk Exchange, who has acted as Secretary since the Association's birth, was presented with a gold wristlet watch in appreciation of the excellent results achieved, largely by virtue of her enthusiasm and energy.

P.O. Orphan Homes.

A recent collection amongst the L.T.S. staff provided a sum of £53 to be devoted to the Entertainment and Summer Holiday Fund.

* * * *

Culled from the Exchanges.

Clerkenwell Exchange.—A correspondent writes:—The tea given by the staff of the Clerkenwell Exchange to 190 children of the Wenlock Road Schools, City Road, was held at the Leysian Mission on Saturday, Jan. 14. The children were drawn from amongst the poorest in the School, most of them having fathers out of work. It was well for us that the masters attended, for 190 children even on their best behaviour want managing; and even the Supervisors, hard and austere as they are, would, I think, have been powerless in the midst of the 190. Every item of catering and entertainment was stage managed by the staff, and really the supply of good things was so plentiful and the tables looked so pretty that I am sure we have some splendid house-keepers on our staff.

It was my debut as a pourer of tea and, goodness, I never knew children had such capacity. In alarm I forcibly stopped one little chap from having his sixth. Several jerseys and coats protruded very much when tea was over, but we were assured by the owners that nothing but a cap was concealed therein. The conjurer, who performed most wonderful tricks was a great favourite, and games and choruses by the children completed a thoroughly jolly evening.

Each child on leaving was given a toy and a bag of goodies so that a little of the joy was taken home. This effort was good, but it only served to show what scope there is to give much needed pleasure to some of our neglected child-life.

East Exchange.—On Thursday preceding Christmas, a party of the East Exchange staff visited Shadwell Children's Hospital and conveyed a taxi-load of toys for the little patients. A conversation with one of the Sisters led to the discovery that the Hospital was badly in need of both funds and garments, so schemes have since been brought into action enabling material to be purchased for the making of nightdresses and woollen vests for the little ones.

This Hospital is situated in one of London's poorest quarters, and a number of its little patients are suffering from the ill effects of insufficient nourishment and clothing. In these cases, it is quite impossible for the relatives to supply anything in form of luxuries, and even eggs are beyond their means, while the Hospital itself is much too poor to provide anything beyond the barest necessities. Visits have been made by members of the staff with gifts of sweets and chocolates, and they have great hopes to do much for the relief of this Hospital in the near future.

Regent Exchange.—Regent has always made it a practice to celebrate each New Year by giving a very special tea and concert to their protégées at Gifford House. Jan. 25 was the occasion of their 1922 feast, and it was an unqualified success. A splendidly performed sketch was given in addition to the delightful solos and recitations. The men declared their happiness was complete when it was found that a very useful gift had been provided for each of them.

The efforts of the Regent Social Club were well rewarded by the great success of the dance which was held at the Holborn Hall on Jan. 30. Mr. Buckeridge with his usual interest in all exchange functions, acted as M.C. Fancy dress was optional, and a fair percentage attended in costume. A prize was given for an "Economy" dress.

"CUTTING."

At times when I'm performing with
A knife and bread and butter,
I've cut myself alarmingly,
Yet ne'er a sound did utter.

And once, tho' I am loth to say,
My first love cut me dead;
It irked me not—I got engaged,
To someone else instead.

Full often I've submitted verse
Of beauty, length, and wit,
The Editor—a ruthless man,—
Has cut out all of it!

Most philosophic'ly I've met,
With all life's vexing cuts,
Just thinking 'twas my proper share,
But—direful, worst of "buts."

O wrest it from its tape-bound rut,
And cry it through the town,
Alas, that "February" cut,
That hateful, fateful wages cut,
That misnamed "cost of living" cut,
Is the "cut" that gets me down.

DOROTHY TURNER.

Victoria Exchange.—A most enjoyable evening was spent on the occasion of a social, held in the Dining Room, Victoria Exchange, on Friday, Feb. 3. Its object was the augmentation of the funds of the Willow Swimming Club. The Victoria staff was well represented, and several members of Mayfair, Trunks, Regent and Gerrard Swimming Clubs were present. The programme consisted of songs and dances and a special entertainment was given by the Minstrel Troupe, composed entirely of the Victoria Exchange Engineering Staff. The refreshments were admirably arranged and great credit is due to the members who assisted in the preparation of them. The evening was a very successful one, and thanks are especially due to Miss Hill, whose efforts for the benefit of the Swimming Club are untiring.

Contract Branch Notes.

Newspapers tell us a great deal nowadays about the wasteful methods of Government offices. The Contract Branch comes into contact with the other side of the question and can testify to the "Dilly Dally" methods of the so-called "World of Commerce."

On Aug. 11 last, a number of Revision of Rate Agreements were submitted for signature to a West End firm of world-wide fame and repute. There was no dispute as to the installation or the rentals payable, yet the Agreements were not signed until a personal note was sent to the Managing Director in the early part of February. Letters, personal calls and telephone calls had, in the interval, failed to produce anything but vague promises out of the Company's Secretary.

In another case a local authority has been asked eight times to return the Revision of Rate Agreements for their Fire Alarm System, but not one of these applications has been acknowledged. It has been ascertained by telephone (after many fruitless attempts) that the Agreements have now been passed by the Fire Brigade Committee and will be recommended to the Council for acceptance in due course!!!

ANSWERS TO CORRESPONDENTS.

Enquirer.—We see no reason for the transfer of the English ends of the Anglo-Irish Free State telegraph circuits to the cable room. The same rules and regulations will no doubt govern the working of these lines as hitherto. The Free State will, however, probably claim a representative at the next International Telegraph Conference.

Costing Clerk.— The elimination of *travelling time* from the calculations in costing referred to in the London Engineering District Notes of last month only referred to costing for "comparative purposes" as regards the actual process and not with a view to costing for estimates. The example chosen, *i.e., travelling time*, is, however, unfortunate as an Associate of the C. & W. Institute states that, "the words used are the technical description for time chargeable on outside jobs."

COMING EVENTS.

Mar. 3.—C.T.O. Annual Dinner, Holborn Restaurant.

„ 10.—Society of Civil Servants. Lecture.—"Co-operation's Contributions towards Collective Control of Industry. Mr. A. Baines, (London Co-op. Society.)

„ 20.—T. & T. Society Paper.—"Some aspects of Publicity in relation to Post Office work." Mr. John Lee.

„ 24.—Society of Civil Servants. Lecture.—"Characteristics of a Great Industrial Organisation." Mr. Hugo Hirst (General Electric Co.), Chairman, Sir Evelyn Murray.

CORRESPONDENCE.

SYNCHRONISM.

TO THE EDITOR OF THE "TELEGRAPH AND TELEPHONE JOURNAL."

SIR,—In the current edition of your journal, a very controversial criticism of the article by Mr. J. W. Teare is rendered by the very distinguished and respected inventor, Mr. Donald Murray.

The criticism has, I notice, met with approval from those unacquainted with the mysteries of synchronism. On the other hand, some of the *dirigeurs* who have had practical experience with Multiplex telegraphy (with and without tears) think otherwise.

The point at issue is not clearly answered. Firstly, Mr. Murray disputes Mr. Teare's contention, and then goes on to say that the Baudot synchronism is amply *good enough*. A point which inventors should bear in mind is the question of *operator output*. A transmitter that runs less than 40 words per minute will be useless to the average operator of the future.

In America, a patient hearing is given to anyone, be he cleaner, or eminent scientist, before an invention is placed on the market.—Yours truly,

R. G. LEATHERN.

C.T.O., Feb. 9.

NEWCASTLE.

MR. CHAS. ANDERSON, Assistant Traffic Superintendent, Newcastle, was presented by his colleagues with three volumes of Rudyard Kipling's poetry and a fountain pen on the occasion of his promotion as Assistant Inspector of Traffic, Class II, at Headquarters. Mr. Davison, Assistant Traffic Superintendent, made the presentation.

BLACKBURN.

On the occasion of the transfer of Mr. J. F. BROWN, Traffic Superintendent, Post Office Telephone, Blackburn, to a similar position at Nottingham, on Dec. 31, 1921, he was presented with a silver tea service contributed to by the Traffic Staff, Heads of Departments, District Office Staff and the Operating Staffs, at the various exchanges throughout the district.

The presentation was made by the District Manager, Mr. E. E. Stockens, in the presence of various members of the staff, who wished Mr. Brown every success in his new district.

Mr. A. L. May, Traffic Superintendent, from Nottingham, succeeds Mr. Brown. The hearty co-operation of the Traffic Staff is extended to him on his promotion to the Blackburn combined district.

On Jan. 20, Mr. Stockens, the District Manager, very kindly presented to the staff, books on Telephone Engineering, Electricity and Magnetism, Mathematics and Telephone Traffic Studies.

In making the presentation, Mr. Stockens pointed out that it is now necessary to pass an examination to obtain promotion to Assistant Traffic Superintendentships. Apart from this, he emphasised the importance of a thorough knowledge of the theory underlying one's profession, particularly in telephone work, where originality and initiative help to forward the Department's development of the telephone system. The Post Office welcome suggestions for improvements, and he hoped the volumes would be the nucleus of a library for the use of the staff. The books are by standard authors, and Mr. Stockens said that during his career they had been of great benefit to him. He hoped that the staff would study and so be able to improve their positions and put forward suggestions for improvements. Mr. A. L. May, Traffic Superintendent, on behalf of the Traffic staff, said how much the staff appreciated Mr. Stockens' very great kindness and encouragement. It is the intention to add to the volumes and have a system of regular study for those members of the staff who intend in the future to sit for the examinations. Also other officers will study, and the Supervising staff held the students forward, and by conference make clear any points not understood.

CONTROLLER'S OFFICE PRIVATE BRANCH EXCHANGE.

RULES FOR THE EXTENSION POINTS.

IN all telephone communications aim at courtesy, both in word and tone. Remember that unless the person to whom you speak happens to be an acquaintance, all that he can know of your personality will be conveyed by the tone of the spoken word.

(*a*) IN MAKING A CALL.

(1) *Ascertain the number required by reference to the Directory* or official list of extension points, as the case may be.

(2) Pass the call immediately the Switchboard Telephonist has said, "Number Please?"; speaking distinctly, giving the Exchange name first if an Exchange call is wanted, and the number only if the call is to another extension of the Controller's Office. *Always give the required number, even when calling local extensions.* Endeavour to leave the Switchboard Telephonist free to devote as much of her mental effort as possible to outside callers, who are usually unacquainted with the extension numbers and local organisation, and who must, therefore, rely entirely upon the Telephonist's assistance.

(3) Listen to the Switchboard Telephonist's repetition, and *immediately correct any error.*

(4) *Wait with the receiver to your ear* until you get a reply from the distan station, or the Switchboard Telephonist gives you some reason why it cannot be obtained.

(5) If the required number is engaged, *repeat the call yourself* after a few minutes' interval. Do not ask the Switchboard Telephonist to make further attempts on her own initiative unless:—

(*a*) You have more urgent work in hand; and

(*b*) You or some fully instructed representative will be available to deal with the call when the Telephonist rings you.

(6) Before commencing conversation with a member of the public, announce yourself as "London Telephone Service, Controller's Office"; where the call is to another official of the London Telephone Service, the announcement should give particulars of the Section and the name of the Officer speaking—or the latter only where this is sufficient.

(*b*) IN RECEIVING A CALL.

(7) *Answer promptly*, giving your name or the name of your Branch or Section in accordance with the attached schedule. *Do not wait for the caller to announce himself.*

(8) *Take and record the caller's message yourself, even though it may not refer to the work of your Branch; also his Exchange Number and Name.* If the caller's message is one which you cannot answer without reference to someone else, tell the caller that his request shall have attention and that he will be communicated with on the subject as early as possible. *In no circumstances should a member of the public be obliged to give his message twice to the Controller's Office.*

(9) If the message is a complaint, neither admit nor deny the Department's responsibility for any difficulty *mentioned unless you are fully aware of the circumstances of the case.* Take the caller's message sympathetically, express regret that he should have been troubled, promise full enquiry, and tell the caller that the result will be communicated to him.

(1) If a member of the Department's staff requires to speak on any matter outside the province of your Branch, say "Hold the line please, and I will put you through to the.....Branch." Ascertain the extension of the official likely to be required, flash the Switchboard Telephonist into circuit by moving the receiver rest up and down slowly until she answers, and say to her: "Transfer the caller to extension ..... please."

(11) See that arrangements are made for someone to answer calls on your extension during your temporary absence from the telephone (*e.g.*, during the lunch interval). Leave a scribbling pad and pencil available in order that you may have a record of messages taken while you are away.

Every member of the Controller's staff should realise that when answering a telephone call the credit of the Telephone Department in the minds of those outside it, is very largely in his or her hands.

Feb. 17, 1922. G. F. PRESTON (Controller, L.T.S.).

MODERN WIRELESS TELEGRAPHY AND TELEPHONY.

BY F. ADDEY, B.Sc., M.I.E.E., FELLOW I.R.E.

(*Continued from page* 94.)

Duddell was unable to obtain an alternating current in the shunt path of sufficiently high frequency to be of use for Wireless Telegraphy, and he was not able to use high powers.

The advance which converted the Duddell arc into a useful means of generating high-frequency currents for wireless purposes was made by Poulsen. He replaced the positive carbon by an electrode of copper, which was cooled by a continuous flow of water through suitable spaces arranged in its mass. He also placed the arc in a closed chamber which was filled with hydrogen or some hydrogen-containing gas, such as coal gas or the vapour of alcohol, and further, he placed the arc in the powerful magnetic field between the poles of a large electro-magnet.

The results of these three modifications of the original arrangement were that alternating currents of frequency high enough for wireless purposes were obtained in the circuit LC and that much greater powers could be dealt with.

In Fig. 27 the capacity in the shunt path has been shown as an actual condenser. There is no reason, however, why this capcity should not consist of an aerial, which, as already explained, can be considered as forming one plate of a condenser, with the surface of the earth as the opposing plate. This arrangement is shown in Fig. 29.

The oscillating shunt across the arc now consists of the inductance L, the aerial, the medium between the aerial and the surface of the earth and the connexion from the earth to the negative electrode of the arc. The condensers C_1, C_1, in the leads from the arc to the aerial and earth respectively, are of large capacity, and are inserted to prevent the supply mains being short circuited if the aerial should accidentally be earthed.

The windings of the electro-magnet which is used to produce the magnetic field in which the arc is burnt are also used as the inductances in the supply leads. They are shown at L_1, L_1, in Fig. 29.

When such an arrangement as that shown in Fig. 29 is in operation the oscillations set up in the shunt circuit round the arc cause a sustained high-frequency alternating current to flow up and down the aerial, with the result that a continuous train of electric waves, of uniform amplitude, is radiated so long as the arc is burning.

Since the frequency of the oscillations in the shunt circuit can be controlled by varying the inductance of the coil L, as explained above, the radiated wave-length which, of course, depends on the frequency of oscillation, can in this way be adjusted.

It is necessary now to provide some method by means of which this steady radiation can be cut up into long and short trains of waves corresponding to the Morse equivalents of the messages to be transmitted.

One method of accomplishing this would evidently be to extinguish the arc at the end of a signal, and re-ignite it at the beginning of the next signal.

Such a method of signalling, however, would be extremely slow. In any practical arrangement the arc must be kept burning steadily all the time signalling is in progress, and some other means must be found for cutting up the radiation into the necessary dots and dashes.

There are two methods by which this is accomplished in practice. The first one, in which the radiation from the aerial is continuous, but in which the "marks" are sent on a wave-length differing slightly from the "spaces," is shown in Fig. 29.

A key K is provided, joined up in such a manner that when it is depressed one or more of the turns of the coil L are short-circuited.

This reduces the inductance of L, which increases the frequency of the oscillations, and so a shorter wave-length is radiated.

The receiving apparatus is tuned to respond to the shorter wave-length sent out when the key is depressed.

Thus, as the key is manipulated the long and short depressions are reproduced as long and short sounds in the receiving telephones, and so the signals can be read.

It is possible to arrange the connexions so that the key short-circuits some of the turns of the inductance L when it is raised, and opens the short-circuit when it is depressed. In this case the marking wave-length is longer than the spacing wave-length and the receiving apparatus is tuned accordingly.

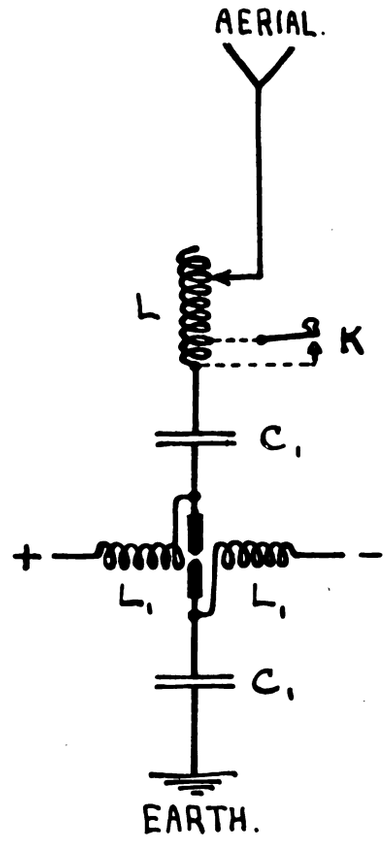

FIG. 29.—CONNEXIONS OF POULSEN TRANSMITTING SET, USING SPACING WAVE.

In the method of signalling just described two different wave-lengths are monopolised by each station. This is a disadvantage. With the continual increase in the number of wireless stations the difficulty of choosing wave-lengths so as to avoid mutual interference between stations becomes greater and greater. If every station takes two wave-lengths for itself this difficulty is, naturally, much increased.

Another method of signalling has therefore been developed in which, although the arc is kept burning continuously, waves are only radiated when the key is depressed. When the key is raised an artificial non-radiative oscillatory circuit, known as the "back shunt," is substituted for the aerial circuit. The arc continues to oscillate on this artificial circuit, but no waves are sent off.

The arrangement is shown in Fig. 30, in which the pieces of apparatus which are common both to the back shunt method and to the spacing wave method, have been lettered similarly to Fig. 29.

The change over from aerial to back-shunt and *vice versa*, is performed by a special key K_1, which is actuated electro-magnetically from the hand key K. The key K_1 consists of a massive

Digitized by Google

fixed contact C, and two moveable contacts A and B. These moveable contacts are carried on springs which in each case tend to spring inwards, so as to bring the contact block mounted on their ends against the fixed contact C.

A rod R, running at right angles to the contact springs, carries two cross-pieces D_1, D_2, which engage with the upper and lower springs respectively, as shown in the diagram. This rod is normally held up by a spring, but it can be drawn down by the pull exerted by the current in the coil M on an iron armature carried on the end of the rod.

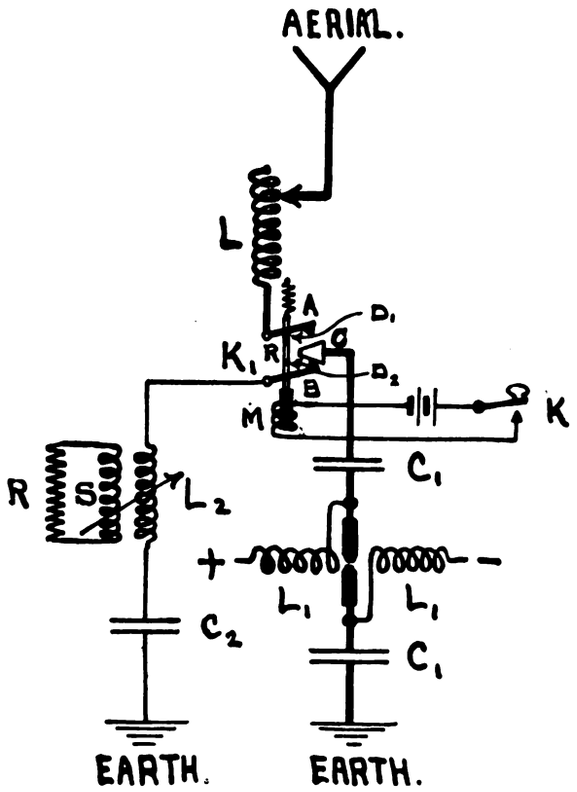

FIG. 30.—CONNEXIONS OF POULSEN TRANSMITTING SET, USING BACK SHUNT.

The upper contact spring is joined to the aerial, and the lower spring to the back-shunt circuit L_2 C_2.

When the key K is at rest the rod R is raised by the spring, and the upper cross-piece D_1 lifts the contact spring A away from the contact C. At the same time the lower cross-piece is raised away from the contact spring B, so leaving this spring free to move upwards and to make contact with C. Thus the arc is now joined to the back-shunt circuit.

When the key K is depressed the rod R is drawn down. The upper cross-piece C_1 moves down, allowing the contact spring A to descend and to make contact with the contact C. The lower cross-piece D_2 now engages with the contact spring B and pushes it downwards, so breaking the connexion between B and C. Thus, the aerial is now joined to the arc, while the back-shunt circuit is disconnected. The positions of the cross-pieces on the rod R are so adjusted that contact is made by A before it is broken by B, or *vice versa*. By this means the arc is never disconnected simultaneously from both the aerial and the back-shunt circuit, so that it continues to burn steadily.

In order that the conditions under which the arc burns may be as nearly as possible the same, whether it be joined to the aerial or to the back-shunt circuit, the "damping," or the rate at which energy is dissipated, in the back-shunt circuit is made equal to the damping in the aerial. In the aerial the greater portion of the energy which disappears is radiated in the form of electro-magnetic waves. The back-shunt circuit does not radiate, and therefore some other means of getting rid of the energy must be employed. The method adopted is shown in Fig. 30.

The inductance L_2 in the back-shunt circuit is made the primary coil of a transformer, the secondary coil of which is S. In series with S is the resistance R. The coupling between L_2 and S is variable. The more closely S and L_2 are coupled, the greater is the amount of energy taken from the back-shunt circuit and dissipated in the resistance R. The coupling is adjusted till no change is produced in the oscillatory current whether the oscillations are taking place in the aerial or the back-shunt circuit, that is, whether the key K be raised or depressed.

(To be continued.)

REVIEWS.

"*Real Mathematics: An Aid to the Study and Comprehension of Mathematics.*" *By Ernest G. Beck, Wh. Ex., Assoc.M.Inst.C.E. Published by Henry Frowde and Hodder & Stoughton, 1 & 2, Bedford Street, Strand, W.C.2. pp. × + 306. Price 15s. net.*

This book has been written as an aid to the acquisition of a really serviceable grasp of mathematics by men who have to use this subject in the course of their practical work.

It is not intended as a substitute for the more orthodox text books, but rather as supplementary to them. The special method by which the subject is dealt with gives living reality to what, unfortunately, is so often to the student merely a collection of dead symbols.

The author takes the mathematical operations concerned in ordinary engineering, from addition to integration, and shows how each process can be represented by well understood terms and operations of every-day life. For instance, in dealing with the rule of signs in multiplication, the mathematical symbols are translated into statements of the financial operations concerned in the payment of bills, and by this means this somewhat difficult point for a beginner is made transparently clear.

Every operation is treated on similar lines, abstract argument being in each case replaced by the visualisation of the actual reality. There is no doubt that such a method of dealing with the subject will be found of great use to all students of mathematics. The author concludes the preface by saying that "the scope of the present volume has been confined to such branches of the work as are most useful to the ordinary engineer and student. Much more is available if required." We hope that the author will shortly bring out the second volume at which he hints. It should meet with a reception as warm as that which we feel sure will be accorded to the present book.

Questions and Solutions in Magnetism and Electricity. By Mr. William J. White, A.M.I.E.E. Messrs. S. Rentell & Co., Ltd., 36-39, Maiden Lane, W.C.2. Price 2s. 6d. nett.—Any student desirous of obtaining the certificate awarded by the City and Guilds of London Institute in Magnetism and Electricity, will find this collection of questions and answers extremely useful not only as a guide to the kind of questions which are likely to be asked, but also as a guide to the most satisfactory way in which they may be answered.

Common Battery Telephony Simplified. By M. Walter Atkins, A.M.I.E.E. Benn Bros. Ltd., 8, Bouverie Street, E.C.4. Price 8s. 6d.—This, the fourth edition of a book which is familiar to many telephone men, has been completely revised, obsolete matter having been deleted, and new diagrams added. The subject matter is clearly and succinctly dealt with and the combination of a list of diagrams and a good index should make ready reference easy.

"Continuous Wave Wireless Telegraphy." By B. E. G. Mittell. Published by Sir Isaac Pitman & Sons, Ltd., Parker Street, Kingsway, W.C.2. pp. vii × 133. Price 2s. 6d. net.

During the last few years the spark system of generating the high-frequency oscillations, used to produce the electro-magnetic waves employed in wireless telegraphy, has been entirely superseded, as far as long-distance wireless stations are concerned, by the continuous wave system. This system is also, to a very large extent, replacing the spark system for medium and low-power stations. It is therefore, important that wireless men should be acquainted with continuous wave working, and the small book under review has been written to supply this need. The three methods of producing continous waves, by the Poulsen Arc, high-frequency machines, and valves, are all described in as much detail as the limits of the book permit. The special methods used to receive continuous waves are also described.

The book is very clearly written, the printing is good and the diagrams are very well reproduced. It is an excellent summary of a subject which is of great and growing importance.

POST OFFICE ENGINEERING DEPARTMENT'S DINNER.

A VERY successful and well attended dinner was held on Feb. 17 at the Connaught Rooms, Sir William Noble being in the chair. We append extracts from the chief speeches :

The RIGHT HON. H. PIKE PEASE, M.P., proposing the health of the Engineer-in-Chief's Department coupled with the name of Sir William Noble, paid a high tribute to Sir William's energy and initiative. He said that the amount of work which was being done by the Post Office at the present time was enormous, and he would think it was greater than that done in any other country in the world. At the present moment there were six thousand million postal packets posted every year. And in contratulating the engineers on the work accomplished he hoped they would forgive him if he said something in regard to that work. With regard to the main underground, good progress continued to be made and during the past year 720 miles of single way duct were laid and 116,000 miles of double were drawn in. Numerous new cables between large towns had been brought into use since March 31 last. With regard to the local underground, in connexion with the extension of local telephone facilities approximately 1,000 miles of single duct were laid and about 100,000 miles of double were drawn in. About 500 overhead trunk circuits were provided, involving the erection of approximately 10,000 miles of double wire. In regard to internal telephone works, in addition to a large number of minor exchanges there were no less than 22 new manual exchanges opened during 1921, providing accommodation for approximately 33,000 subscribers. There were also 11 new exchanges and 13 extensions ordered during the year. These would be completed by degrees to provide for a further 16,000 lines.

Among the new exchanges was the London Toll Exchange and this plant was designed and installed for the purpose of affording rapid service over shorter trunk lines and had enabled relief to be given to the London trunk exchanges by removing a large number of circuits working between London and the nearer Provincial towns.

He would like to say one or two words also in regard to telegraph works. The chief feature of telegraph development was the large extension of machine-printing apparatus, mainly Baudot Duplex, relieving the operator of the nerve-racking system of Morse. Questions on this subject were often raised in the House of Commons, and he had had the opportunity on many occasions of arranging visits to the C.T.O. from men who hold important positions. The speed of the Imperial Cable in the westward direction had been improved by the use of new apparatus. The extended use of the Post Office "G" relay had enabled additional circuits to be worked without the use of repeaters, saving considerable expense both in first cost and maintenance. Also a new method of automatic through switching of telegraph circuits based on the same principles as the automatic telephone, had now been developed and promised good results.

The Chairman, SIR WILLIAM NOBLE, thanked Mr. Pike Pease on behalf of the engineering department for filling the breach caused by the absence of Mr. Kellaway, and undertaking the duty for which he was to be responsible. He would like to mention one or two points to which he referred last year One of the things was that shortly before their dinner took place in 1921, a Parliamentary Committee had been appointed to inquire into the telephone service. Little did he think that this year he would not be able to give his opinion of the report of the Committee, but Parliamentary Committees moved slowly as a rule. This particular Committee must have found its task very much more difficult than a certain other Committee which was appointed at a much later date, and which covered the whole field of Government Departments, took evidence from all these departments, had issued two voluminous interim reports, and would furnish a final report by the end of the month.

One other matter that he referred to last year was the conditions in regard to telephone work. He stated that there was a great shortage of material ; that prices were high ; and that contractors were giving long dates for delivery and even these dates they did not keep to. He was glad to say that in these respects things are now much better. There was more raw material ; prices had fallen and dates for contracts were very much shorter. Unfortunately, however, work had fallen off. They knew that good trade and good telephone business go hand in hand. There had been a great slump in trade and it had its effect on the telephone work. That was shown in the department by this fact ; that last year at this time they had a staff of over 26,000, this year it was about 24,000, a falling off of over 2,000. This was very regrettable at such a time of unemployment. They were only hopeful that trade would revive and the telephone business would revive along with it.

One other matter. They know that there was an economy campaign. He had referred to a Committee which has been dealing with the subject. They might save the millions from departments which are not revenue earning departments if they would only keep their hands off the revenue-earning departments. They had never had a chance to bring the telephone plant up-to-date so that they could meet every demand promptly. This was an excellent opportunity when trade was not good, and telephone business had, as he had said, fallen off, to bring their local and trunk systems right up-to-date so that when trade revived no business man would have to wait for weeks for his telephone. He hoped, therefore, there would be no cutting down of their programme for next year.

MAJOR PURVES said that his duty was the light and pleasant one of giving the toast of their visitors. In the course of his speech he made references to Mr. Pike Pease, the Secretary, Mr. L. B. Atkinson, Mr. Wordingham, Sir John Snell, Sir W. L. Mitchell, Sir Alex. Richardson, Mr. McQuarrie, Sir W. J. Noble, Sir Tom Callender, Mr. Raven, Mr. Kidner, Sir Andrew Ogilvie, Sir Robert Bruce, Messrs. Morgan, Kempe, Stubbs and Moir, and Dr. Walmsley.

They were pleased that members of the great Bell organisation thought it worth their while to come over here to see what the Post Office could show them.

He heard that Mr. McQuarrie a few days ago, after having a conversation on one of their high-frequency carrier wave channels between London and Bristol, expressed the opinion that the transmission of speech was uncommonly good. He did not know that he actually said it was much better than anything of the kind he had heard in America, but it was rather inferred, from the excited expression on his face, and the trembling of his hands, that that was so.

The department had recently been a target for many ill-balanced attacks on account of the backwardness of British telephone development as compared with that of the United States, and they were aware that the manner of these attacks had made their friends at the head of the American Bell organisation both sorry and indignant. They knew that there was nothing more irritating to a well-disposed man than to have his perfections and accomplishments used, ignorantly and malevolently, as a rod to be laid on the back of his friends. Mr. McQuarrie was sailing for home to-morrow and he would ask him to assure their friends in the States that in that matter they had their sincere and affectionate sympathy.

SIR JOHN SNELL said he would like to take the opportunity of making some reference to the telephone position. He had often thought in reading of the complaints in the press against the department for what was termed inefficient telephone service, how little the public and the press really knew of the true position. Without in any way attacking the National Telephone Company, or his old and trusted friend, Mr. Gill, it was the sheer force of circumstances prior to 1912, namely, the purchase, the impending purchase of the Company's system which, not unnaturally caused those who were directing their affairs to spend as little money as possible on the expansion of the system. And it naturally fell to this department and the Post Office, when the telephones were transferred, to have to buckle to and make up the lee-way in order to bring the system up to a most efficient position. He ventured to say, without fear of contradiction, that had it not been that some 18 months later they were met by the circumstances of the Great War, the department would by now and for several years past, have overtaken the arrears of work and put the telephone system in as high and efficient a position as any engineering work of that kind could possibly be.

It seemed to him that the knowledge of the Engineer-in-Chief of a great department like that and of the principal engineering officers must be almost enclyclopædic, because not only had they to deal with past telegraph systems; not only land, but marine, with wireless telegraphy on a big scale, but even with great engineering problems which, if anyone would only visit such a place as Mount Pleasant or some of the other big distribution centres of the Post Office Engineering Department, he would see for himself the mechanical devices and time-saving devices indicative of engineering skill of the very highest character. The public, he was perfectly convinced, did not in the least appreciate the real and immense engineering knowledge which is necessary to the staff conducting this great work.

SIR EVELYN MURRAY, K.C.M.G., in proposing the toast of the Chairman, said he personally had the highest respect and admiration and some feelings of awe for engineers in general. They provided us with many services that were useful and indeed necessary. He had especially a feeling of awe because

Digitized by Google

he knew perfectly that if by any chance one cornered them in a discussion, they could always relapse into a technical jargon, which, to him, was equivalent to an unknown tongue quantity. He had specially an affection for Sir William Noble because, in the many discussions which they had from day to day, he had always refrained from using his natural advantages in that respect. If he had any complaint it would be this: the pertinacity and vigour with which he pressed what he considered the legitimat claims of his staff, but in that assembly that quality would not be regarded as a defect.

SIR WILLIAM NOBLE, in reply, said that he would like to endorse heartily that the Secretary did not obstruct the Engineering Department. There are some people who said that you could not get successful telegraph and telephone business with the management in the hands of the Secretariat. It was entirely wrong. Every business must have a General Manager and there was no business in which a General Manager interfered ess with the technical work than did the Secretariat. He had been most ably supported by the whole of the staff. Any success he might have as Engineer-in-Chief to the Post Office would be largely due to the hard work and the loyalty of his staff.

THE BAUDOT—XXXI.

BY J. J. T.

The Selector Levers.—Should it become necessary to remove these levers they should be replaced in the same order, and to this end it is usual to number them 1 to 5. Once correctly fitted, and frail as they may appear to the eye, it is seldom that they need repair. Should one become broken it should be replaced by one of identical number. It may happen that the foot of a selector lever may prove very slightly longer or shorter than normal. This will evidence itself in certain irregular vibrations producing irregular and unlooked-for movements. This may be recognised by the fact that if the pressure of the propulsion lever spring be *increased* (by gentle pressure of the finger upon it), the irregularities will become accentuated by selector levers *other* than the one the foot of which is of abnormal length.

The axles of these, when in action, should not protrude sufficiently to touch the propulsion lever. The thickness of an ordinary piece of Baudot slip will prove an index of sufficient clearance.

Be sure that the head of each lever is perfectly free in its movement with respect to its neighbours, or false letters will result.

The Propulsion Lever Spring.—This (Fig. XLVIII S. Vol. VII, No. 70) should have a tension sufficient to permit of the easy movement of the selector levers. It will be recalled that the propulsion lever (Fig. LXVIII OO^1) governed by this spring forms part of the sixth or foot-less lever and thus controls the pressure upon the entire combination of selector levers. Too strong a tension of this spring produces abnormal wear and tear both of the selector levers and also of the combiner itself, together with an undue rebound of the former upon their replacement.

The Propelling Rod (Fig. XLVIII R).—The freest possible play should be given to this rod. To prove, slacken the propulsion lever spring. The rod R, the short arm *f*, and the pedal P should all fall back easily.

The Pedal Spring (Fig. XLVIII F) should only have sufficient tension to just hold the retaining click C in its rest position of engagement ready for release by the down-thrust of the hammer head H.

That all the various moving parts mentioned above should be kept carefully lubricated will be fully appreciated without further comment.

The Impression Wheel (V^1 Figs. XLIX and L, Vol. VII, No. 72).—The 31 slots on this wheel correspond with the 31 possible positions on the combiner discs. To ensure correct printing the impression lever and cam Ca (Fig. LI) must engage in the slot which corresponds with the letter desired to be printed. To obtain this position it is necessary to fix the impression wheel V^1 upon the axle X^1 in correct relationship with the combiner discs.

The method suggested as the most practicable is the following: Bring the first selector lever only into action (this represents the letter A of the Baudot code) and turning the combiner wheel gently with the hand watch the impression lever and its releasing mechanism very closely, adjust the impression wheel on the printing axle X^1 to that position where, when the hammer head H shows the maximum gap between it and the cam of the impression lever, Ca is exactly opposite the first tooth of the impression wheel. The adjustment of the impression wheel to this position is made possible by loosening the binding screw *e* so that the catch E can be moved to the required point, thus carrying the wheel round with it.

The Type-Wheel.—The adjustment of this wheel is made by means of the screws fixed on the face of the wheel, taking the letter M or W for preference as a standard for adjustment. Faintness of the right or left side of the type may be corrected by scrupulously fine movements of the type-wheel in the necessary direction, the wheel being finally fixed in position by means of the screws mentioned. M and W being correctly printed make a further test with C and O. Then prove the entire alphabet. To ensure perfect printing of letters and figures it is at times necessary to adjust the inversion or figure and letter shift lever. For example, if the left leg of the letter M is faint and the right heavily typed, the inversion lever has moved through an arc larger than the $4\frac{1}{2}°$ which is the limit allowed for the movement of this lever, *i.e.*, the type-wheel has also shifted to a similar point of inaccuracy. The limiting screws are the cause.

(To be continued.)

THE IDEAL SUPERVISOR.

FROM the point of view of both department and staff, the ideal supervisor must possess certain attributes, one of the most important of these being the power to control. It is necessary for her to possess a distinctive personality in order to maintain discipline. She must be firm in her manner without adopting an overbearing attitude, for that produces either open rebellion or a sullen rendering of duty. She should also possess self-control to enable her to act with promptitude and decision in all cases of emergency.

Adaptability.—She must learn to adapt herself to her surroundings, and depend upon it she will be all the happier. It stands to reason that while in the service of the department she will do well to adopt the methods or systems which prevail.

Sympathy.—Sympathy in the broadest sense of the word, is also an indispensable quality; that is, not merely the sympathy one extends in cases of illness or bereavement, but a feeling of real human interest in the members of the staff, who should be able to feel instinctively that when difficulties arise with which they are unable to cope they can rely upon the ready sympathy and better judgment of their supervisor, whose wider experience will enable her to be helpful in effecting a remedy.

Tidiness.—It is an undisputed fact that children reflect the virtues and vices of their parents, partly as a result of environment. This may be said to be true of staff and supervisor, though perhaps in a lesser degree. Human nature is perverse and there is always a tendency to copy the faults and failures of those in authority, or rather, should I say, to excuse one's own faults because one has recognised similar weaknesses in a supervisor. The fault of untidiness, for instance, is one which renders itself open to imitation only too readily. A switchroom strewn with pieces of paper and presenting a general air of untidiness, is the reflex of an unmethodical brain, besides being a most unpleasing sight to anyone who enters. The value of tidiness, both personal and in the arrangement of papers, &c., cannot be over-estimated. "A place for everything and everything in its place," is an old maxim, but the principle is one which means considerable economy of time, and ensures much tranquility of mind in times of stress.

Consistency.—Above all a supervisor must not be erratic, nor must she be influenced by personal likes and dislikes. If she would gain the confidence of her staff she must be consistent in her demands upon their efforts. If she succeeds in making them understand that only their most conscientious work will be acceptable, and that such work will meet with her approbation, she will have done much towards securing the harmonious working together of herself and staff.

The ideal supervisor will take a broad outlook on life, and although during working hours she will throw herself heart and soul into her work, she will not let it be her companion in her leisure hours. She must be able to enter into the social life of the department, for it is during our social hours, when strict discipline is relaxed, that sometimes hidden virtues reveal themselves, and help us to understand each other. Social life and widened interests will help her to throw off the hundred and one worries of the day, and will enable her to return to her duties morning by morning with a clear brain and renewed energy. Thus she will be able to tackle more successfully whatever the day may have in store.

"OPTIMIST" 2.

Digitized by Google

TELEGRAPHIC MEMORABILIA.

DOUBTLESS few readers interested in telegraphy have missed reading that highly interesting paper by Mr. J. Stuart Jones on "Telegraph Mechanical Aids from a Traffic point of view," published in the March issue of the T. AND T. JOURNAL.

One cannot, however, quite agree with perhaps the only dogmatic statement in the entire paper when he says:—"The evolution of the multiplex should clearly be in the direction of page or form printing." Why? "The pasting of Baudot tape on a form is a rather messy operation, and the result is not a pretty form of telegram," is apparently the reply. There are in the C.T.O. some of the daintiest attired women in the City and yet they manage very deftly to gum up slips without making either a fuss about it or a mess of it. There are in the C.T.O. men also who well-groomed, accept the task without pother and turn out thousands of telegrams per annum which certainly do not present anything approaching a discreditable appearance. I would even venture to say that the "messy" operation of gumming slip does not leave the hands in half so hopeless a mess as handling carbons when making "multiples." Mr. Jones gives pride of place to Creed for Press, and rightly so, but here again gumming of slip is an essential part of the operation. Who grumbles? In the same paper appears the following: "We must not overlook, for example, the Siemens-Halske apparatus." Again agreed, but here also an essential part of the reception is the gumming of slip. It may be that the Government telegraphs have not yet devised the method par excellence of dealing with the gumming of slip. In Germany and also in France, scissors are used for cutting the slip, a method which does not appeal to the writer. The Eastern Telegraph Company have a small device the cost of which cannot be more than a few pence, which certainly facilitates the gumming process admirably. It would be interesting to know, too, what constitutes a "*pretty* form of telegram." Much depends upon the actual form provided. What the business man desires is a clearly printed telegram. He really doesn't care a jot about aught else unless it be a form sufficiently sturdy to survive handling and ultimate filing.

The paper read by Miss Herring of the C.T.O. before the members of the T. and T. Society on "Women as Civil Servants," was in all respects an admirable effort. Logical to a fault in some respects, it was indelibly marked by that sincerity of purpose and that quiet confident conviction which is a feature of Miss Herring's personality. Whether it was that so far as the male audience was concerned the speaker was preaching to the converted or whether the presence of Miss Liddiard in the chair made the men speakers stumble at the outset in the unusual form of address "Madam Chairman," one cannot say. The truth must, however, be told that except in the case of the speaker who practically closed the comments of the audience, the remarks of the sterner sex were particularly stumbling and halting. On the other hand, of the ladies who were present in the audience, strangely enough there were very few, not one rose even to express appreciation of the paper which must have meant hours of hard work on the part of the reader of the paper. I recently came across in the columns of of *The Bookman's Journal*, the following item, which although probably known to Miss Herring, may possibly prove interesting to the wide circle of our readers. It is the undebateable evidence given of an actual printing and publishing business carried on by a woman in the 16th century. It appears in the title page of an old book and runs as follows: "*Endimion, the Man in the Moone*, by Lyly, printed and published by Widdowe Broome, 1591."

The *Manchester Guardian* is responsible for the following:—A trial is to be made or is at the moment being carried out with a view to the development of a rapid telegraph service in Germany. Berlin and Hamburg are to be the testing points of the experiment." *Lightning wireless* stations will be established in both towns. A telegraph message can be telephonod to one of the stations. It will be transmitted by wireless to the other, and from there it will be telephoned to the person to whom it is addressed. The charge per word is to be 50 marks, with a minimum charge of 500 marks for the entire telegram. It is assumed that once the service is in working order it will be possible to receive a telegram a few minutes after it has been sent.

Very large orders for telegraph and telephone equipment will be placed by the Australian Commonwealth during the coming few years. It is possible that a loan of about £10,000,000 will be issued on this account. British manufacturers will doubtless keep an ever open eye on these possibilities.

From all I hear the workshops of the Indian Telegraph service at Alipore are making considerable strides. A system of apprenticeship has been introduced as an experiment which it is hoped will gradually produce a type of better skilled workmen. The extent of these works on a nullah of the Hoogley may be gathered from the fact that telegraph apparatus, telephone switchboards, steel poles and masts, cable plant, tubing, nickel plating, galvanising and the maintenance of no less than forty motor lorries, form only part of the regular output of this undertaking.

In the second Interim Report of the Committee of National Expenditure, the following appears under "Telegraph Subsidies:"

"There are only two subsidies now covered by this Vote of £10,800, viz.: (1) to the Eastern Extension Telegraph Company: and (2) to the West India and Panama Telegraph Company. As regards (1), this is a subsidy of £2,800 a year, paid to the Eastern Extension, Australasia, and China Telegraph Company in respect of the cost of maintaining the cable from Chefoo to Wei-hai-Wei. This arrangement may be terminated at any time by three months' notice. We are informed that, as part of the recent general agreement with China, the Government have already agreed to give up Wei-hai-Wei. In these circumstances, we recommend that the arrangement with the Telegraph Company should be terminated at the earliest possible moment, with a consequent saving of the subsidy."

A correspondent reminds us that Mousehole, the landing place of the Imperial Cable, was also the scene of another and unique landing, namely, that of the Spaniards, and was the only piece of English soil upon which they ever set foot. Mackerel and pilchards also land there, was the further comment of a local fisherman!

The Swiss Government has issued the first printing of 10,000 telegraph forms upon the back of which an advertisement of a butter substitute is displayed. This has been done to assist in reducing a deficit.

The *Westminster Gazette* recently informed its readers that a new wireless telegraph station, built entirely by Russian workers, is nearing completion at Detskoje Selo. It has for some time been known that the Russians were actively engaged in developing the most modern features of telegraph. There is, for example, a wireless laboratory at Nijni Novgorod, where, according to Soviet information, one of their engineers has successfully demonstrated his automatic radio-telegraphic apparatus for receiving dispatches and printing them automatically with remarkable rapidity. One surmises something after the pattern of the Siemens system in this connexion.

Ordinary telegraphic and wireles communications were programmed to be resumed between Italy and Russia about the commencement of last March.

British wireless amateurs may be interested in the following information culled from the columns of the American *T. and T. Age* referring to "Broadcasting" and wave-lengths:—"The wireless wave-lengths assigned by the American Government to the different classes of stations are roughly as follows:—Trans-Atlantic, from 12,000 to 16,000; limited commercial service, from 2,600 to 2,700; Post Office, from 3,000 to 4,200; Navy, from 600 to 1,600; commercial, from 300 to 600; special amateur, from 275 to 350; and general or restricted amateur, 200 metres. Wireless inspectors have recently been authorised by the Department of Commerce to insert in all general and restricted amateur station licences the following:—'This station is not licensed to broadcast weather reports, market reports, music, concerts, speeches, news, or similar information or entertainment.'"

As is well-known in wireless circles, the Westinghouse Company of the U.S.A. opened a radio service at E. Pittsburg, Penn., twelve months ago. This has been taken advantage of by many folk across the Canadian border. The broadcasting programme of this enterprising service includes the usual musical items, but adds what must be unique features in its "Talks to farmers and sailors" and "Bed-time stories for children."

The celebration of the jubilee of the Institute of Electrical Engineers has naturally given added interest to the development of wireless telegraphy. Correspondence in *The Times* claimed on behalf of David Hughes that as far back as 1879 the latter had discovered electric radiation, but had permitted himself to be argued into the belief that the efforts observed were those of ordinary electro-magnetic induction. Evidence of this is given in a letter to the *Electrician*, of May 5, 1899, Vol. XLIII, and an interesting forecast was also made by the late Sir William Crookes in the *Fortnightly Review* of February, 1892, in an article entitled "Some Possibilities of Electricity." Another correspondent maintains that long before 1879 Joseph Henry of the Smithsonian Institution of Washington as recorded in his "Collected Scientific Papers," noted certain effects which he suggested were those due to the action of electric waves at a distance. The whole history of human knowledge is a repetition of these examples of men widely parted by time and space stumbling upon the same secrets of Nature yet only half-recognising them. Thus sings Alfred Noyes:—

> Have you no song, then of that nobler war?
> Even of this victory that they helped to win
> Silent discoverers, lonely pioneers! . . . . .

There will probably always be a number of phenomena which we humble folk, moving about at our daily tasks, pass over unnoticed every day which, if observed by the *right* man or woman, might open new vistas of electrical exploration. It was a professor of science who once observed that he wished he could have the same facilities of watching the effects of an electric discharge through a long submarine cable as was the good fortune of many a telegraph test-clerk. The writer some years ago was asked by a little messenger boy why when we turned the motor switch of the Hughes instrument from "off" to "on" the needle of the *line* galvanometer gave a slight swing over. Shame on me I had never noticed it till then. However, he "supposed" it must be the disturbance caused by the first rush of the current. Fortunately, I was able to save myself from complete self-contempt by realising that this youngster also had discovered wireless.

I was really jealous of Youth and its twentieth century facilities for acquiring knowledge when, on a recent occasion a privilege ticket permitted me to be present at a students' lecture of the Regent Street Polytechnic. There, Mr. Gill, the European Manager of the Western Electric Company, presented their admirable film of the Action of the Thermionic Valve to a keenly interested crowd of young men—budding engineers. A few grey-heads managed to hide themselves in the back or side seats, otherwise it was Youth with a big Y, and yet not unduly assertive. Whatever of haziness may have possessed the slow-moving brain of the writer prior to his view of the film and its clear-cut exposition of valve action, certainly one felt a sense of having thoroughly gripped the subject as the last few feet of the reel rolled off and left the blank screeen before us.

We note with extreme pleasure that the Edinburgh Telegraphs have started a T. and T. Society under the presidency of Brigadier-General Price, C.B., C.M.G. Now we wonder if our old friend Major Jayne had anything to do with the inception. London will have to look to its laurels, for once the city of light and learning with all the talent which it is well-known lies latent therein sets its hand and will to a work of this kind it will not be satisfied with the mediocre.

So there is dissatisfaction in Bombay, Calcutta and Rangoon over the telephone service of these cities, and yet they are in the hands of private companies. The Government have intervened apparently and one learns from Indian engineering and other papers that "the companies are willing to extend their systems, and to install improved apparatus on condition that they are guaranteed security of tenure under their licences for a further period of at least 20 years. They insist that in view of the increase in working expenses, and the additional capital outlay that is involved, *some enhancement in the maximum connexion rates charged the public shall be allowed.*" The italics were not in the original press statement!

Spain, by the way, is nationalising her telephone system, and it is expected that within five years all the circuits will become Government property. Although concessions to operate telephone systems in Spain were granted for periods in some cases of over forty years, all contained a reversion clause whereby the Government had the right to take over the lines without remuneration at the expiration of a certain period.

Mr. R. Hill, Superintendent, C.T.O., "handed in his checks," as he once put it, so far as his official career was concerned just before our last number went to press. "Bob," was one of those bluff hearty types of the old rough and tumble days of telegraphy, when at race meetings and other special events all sorts of conditions of "temporary accommodation" were provided for, or annexed by the special staff delegated for the duty, and when the strict application of *per noctem* and other similar accountancy terms were neither requested or enforced. His knowledge of telegraphy was of a very practical and efficient character, and he was enthusiastic of the efficiency of the good old times. That the excellent health and strength with which he quitted the service may follow him through many long years is the united wish of the C.T.O. May he live long to sit by the fireside of some cosy way side inn and recount his many cheerful reminiscences of old-time telegraphy and that behind the smoke of a "*churchwarden.*"

Liberty.—It is important to give the freest scope possible to *uncustomary* things in order that it may in time appear which of these are fit to be converted into customary things.—JOHN STUART MILL.

Light.—The pressure of light on the whole surface of the earth is about 75,000 tons weight. A wave of orange light completes about five hundred million million vibrations in one second.—P. PHILLIPS, D.Sc., B.Sc, &c.

J. J. T.

LONDON ENGINEERING DISTRICT NOTES.

Carrier Current Telephony.

A PAPER on the above subject was read before a meeting of the Institution of Post Office Electrical Engineers on Wednesday, March 8, by Messrs. C. A. Taylor and R. Bradfield, of the engineering department. The subject is one that has received considerable attention of late, particularly in the United States of America, where, owing to the great distances between some of the important towns, there is a greater field of usefulness for the system. It came as a surprise to many in the audience to learn that moderately successful experiments in carrier current telephony were carried out as far back as 1895. In the words of the authors the theory on which the system rests is simple. An alternating current of frequency above the audible range is generated by any suitable means. The amplitude of this carrier current is then made to vary in accordance with the slower oscillations of the voice impressed upon it and the carrier current so modulated is sent out to line. At the receiving end the whole received current is rectified, and the result of this operation in effect is to eliminate the carrier waves and leave only the slower audio oscillations by which the carrier wave had been modulated. By selecting a number of different frequencies for carrier purposes, a corresponding number of channels can be provided and multiplex telephony attained. It goes without saying that the modern magician's wand—the thermionic valve—plays an important part in the system as an oscillator for producing the high-frequency currents and in conjunction with the transmitter as a modulator. For practical telephony some form of signalling over the circuits is necessary, and the authors described two practical methods of providing for this.

The conclusion arrived at by the authors as a result of their experiments is that the system is not likely to be of value in this country for providing trunk circuits between large centres because such circuits can be supplied more economically by means of light gauge cable and repeaters, but that it should be useful as a means of adding one or more trunks to distant or out-of-the-way exchanges where the number of circuits would not justify the laying of telephone cable.

Things not mentioned by the Press.

As probably all readers of this JOURNAL will not purchase the Geddes Committee's Report, and may form the opinion by reading the daily papers that the Committee had nothing good to say about any of the Civil Service departments, they will be pleased to have an opportunity of reading the following observations on the Post Office engineering department culled from the Third Report:—

"We have examined very carefully the various methods which are employed to secure a satisfactory output of work from each workman. The total time occupied by the workmen on maintenance is divided by the number of units maintained and the average cost of maintenance per unit per week is arrived at. By this means the Engineer-in-Chief keeps in close touch with the cost of maintenance in each of his districts, and is able to compare the results obtained in various districts.

In regard to construction work, progress reports are compiled which enable the Engineer-in-Chief and the Superintending engineers to ascertain the cost under each item of work.

We find that the results for the various districts are circulated to all Superintending engineers, so that a laudable spirit of rivalry is encouraged.

In this department there is a systematic compilation of results and circulation of information."

Convivial Gatherings.

Two events of interest to engineers took place during February. The first was the annual dinner of the Post Office engineering department which was held at the Connaught Rooms, Great Queen Street, on Friday, the 17th, and of which a report appears elsewhere.

The second event was the annual dinner of the Institution of Electrical Engineers, held at the Hotel Cecil, on Tuesday, the 21st. Owing to the sudden illness of Mr. Highfield, the chair was taken by Dr. W. H. Eccles, D.Sc., F.R.S. The gathering was of especial interest to Post Office servants by virtue of the fact that the Postmaster-General was the principal guest of the evening. In giving the toast of the Institution of Electrical Engineers, he referred to the fact that the Institution was founded by telegraph engineers fifty years ago, and that the original membership of 100 had increased to 10,000. Mr. Ll. B. Atkinson in proposing the toast of "Our Guests," paid tribute to the good work done by Sir W. Noble in helping to swell the membership by inducing so many Post Office engineers to join the Institution.

Western Telephone Cricket Club.

A really excellent concert in aid of the Western Telephone Cricket Club, which is formed from the members of the West External and Internal Sections, was given at the Town Hall, Chiswick, on March 8. There was a large attendance, and it was pleasing to note the presence of Mr. and Mrs. McIlroy, with whom were Messrs. Cardrey and Wilson, the joint presidents of the Club, together with Mr. J. L. Brown, the popular chief of a neighbouring section. The Committee are to be congratulated on a successful evening, and a special word of praise is due to Mr. H. F. Walker (Park Fitting) for arranging such an excellent programme. Such social events bring the staff into closer relationship and tend to produce a better understanding all round, which is to the good of the service.

The "Denman" Chess Club has signalised its entry into the Civil Service and Municipal Chess League by winning seven of the first ten games played. Needless to say keen rivalry exists between the League Clubs, and the Denmanites are to be congratulated on their progress in the first year of their League experience. As results stand at present, there is a chance of the club's promotion to the second section of the League. Much depends on the result of a match game to be played within the next few days, and it is hoped that the efforts made by our chess colleagues will be crowned with success. A considerable augmentation in the membership of the club occurred this season, and it is anticipated that next year, if the satisfactory increase in membership is maintained, the formation of two match teams will be practicable.

The possibilities attending the formation of the new Civil Service Chess Association, to which the "Denman" and other service clubs may be affiliated, will not, it is thought, be lost sight of, and indeed should be an additional inducement to unattached players in the service to join their respective clubs. The Association will be affiliated to the larger service organisation recently formed, the Civil Service Sports Club. When it is mentioned that one of the primary objects of the Association is to obtain club premises centrally situated in London, the advantages accruing to membership will be apparent, the fee being purely a nominal one. The future may yet see some of our zealous colleagues playing in "Civil Service" *v.* "Rest of England."

A MILLION TELEPHONES IN THE UNITED KINGDOM.

The total number of telephones in the United Kingdom exceeded one million at the end of January last, and reached about 1,000,500, of which 984,395 belonged to the Post Office system, upwards of 13,300 to Hull Corporation, and 2,806 to the States of Guernsey.

Excess or deficit	+£5,200,000		—£3,156,000		+£8,100,000	

2. The volume of Post Office business is governed largely by the trade, and industrial situation, and we are informed that the Estimates for 1922-23 are based upon the present traffic, charges, and services, and that no allowance has been made for any general revival of trade. A margin has, however, been allowed for the expansion of the telephone system.

7. *Telegraphs.*—In this department quality of service and economy of operation have to be kept equally in mind.

We have made inquiry as to how the checks of the department are exercised, and find that returns are furnished to headquarters for one day per month by the smaller offices and one day in alternate months by the largest offices. By this means a check on the quality of the service is maintained.

A periodical check on staffing is also maintained by headquarters, and the following table shows for the last five half-years how the staff and traffic have varied at the 97 largest offices:—

Date.	Staff Hours.				Total Traffic (Valued).	Average Hourly Number of Telegrams dealt with per Officer— (a) By the Manipulative Staff. (b) By the Total Staff.	
	Supervising Force.	Non-Manipulative Force.	Manipulative Force.	Total Force.		(a)	(b)
October, 1919* ..	13,350	42,325	115,359	171,034	2,411,955	20.9	14.05
April, 1920 ..	13,652	44,280	102,744	160,677	2,254,379	21.9	14.02
November, 1920..	13,322	44,296	94,861	152,480	1,785,597	18.9	11.75
May, 1921 ..	13,640	42,060	86,042	141,743	1,975,834	23.0	13.93
October, 1921 ..	12,892	39,968	87,548	140,409	1,698,204	19.4	12.10

* Traffic inflated by Railway Strike.

It will be seen that the average hourly number of telegrams dealt with between 8 a.m. and 8 p.m. on the day of the test shows considerable variation. The Post Office regard an output of 24 telegrams per hour per operator employed on manipulative duties as reasonable for an average office; and it will be seen that the average in October, 1921, was only 19.4 per hour, a reduction of 3.6 per hour compared with the previous test, and 4.6 below standard. Similarly, although here the figure is a little more difficult to compile, 14 telegrams per hour is regarded as the average over-all output for all staff, and this figure was actually reached in October, 1919, and April, 1920. At the last test, however, the output was only 12.10.

These figures show, we think, that while there has been a steady decrease in the force employed, this decrease has lagged behind the fall in traffic. It is admitted that there is an estimated surplus of telegraph staff of about 15 per cent. over bare necessities. Telegraph traffic, however, is not regular, and we append a diagram, Appendix (B), showing the fluctuations in the average daily number of telegrams handed in throughout the United Kingdom during the last three years. We recognise that in the case of a sudden increase in traffic the staff cannot be immediately augmented by trained personnel, as it is some time before an operator can give a reasonable rate of output. Some reserve of force is therefore necessary; but we find it difficult to justify the retention of 15 per cent. surplus staff, especially as there is a staff of about 11.1 per cent. carried as a relief force to cover sick and holiday absences. Further, holidays are given during the period of maximum traffic.

The present rate of wastage is about 7½ per cent. per annum, and this has been allowed in the Estimates for next year. We think unless there is an increase in traffic, the rate of wastage might be slightly accelerated during next year and a saving of a further £30,000 a year effected.

In reviewing the Telegraph Service we have been impressed by the full information regularly compiled as to the volume of traffic, the staff employed, and the efficiency of the service.

8. *Telephones.*—As in the case of telegraphs, quality of service and economy in operation are equally important.

A check on the traffic and staff is maintained by means of a return for one day in each quarter in the case of the larger exchanges, and for one day in six months for the smaller exchanges. We have examined the individual returns and also the summary, and are satisfied that the figures produced enable a very complete check to be kept on the efficiency of the various exchanges, and we are told that the operator is not aware when the check is being taken.

From the beginning of 1921 the traffic rapidly decreased, and the decrease was accentuated by the introduction of new rates in April, 1921. By May, 1921, when the steps taken after the Armistice to strengthen the telephone staff had produced the maximum trained staff, the busy-hour load of originating traffic per operator had fallen to about 155 "valued" calls. The standard busy-hour load recognised by the Post Office as efficient is 200.

It was estimated by the Post Office that at May, 1921, there was a theoretical surplus of 16.9 per cent. of the staff at exchanges of 300 lines or more. Recruiting was suspended, and while the staff has been reduced the number of lines had increased, which has resulted in a reduction in the theoretical surplus.

Appendices (C) and (D) give a summary of the lines, traffic, staff, and service of these exchanges from November, 1918, to January, 1922, with notes which may be of interest.

In this case also we have been favourably impressed with the information regularly compiled with a view to securing economy of operation and efficiency of service.

Of the 15,800 operators, 13,300 are employed at the larger offices, and we think that, failing a growth in traffic, recruiting should remain suspended, retirement accelerated, if possible, and an additional saving of £10,000 realised next year."

(We do not reprint the appendices owing to lack of space.)

In conclusion, the Committee are of opinion that the cost of telegraph and telephone staffs can be reduced by £40,000.

RETIREMENT OF MR. A. H. HOPKINS.

A UNIQUE RECORD.

To have spent 50 years in the service of the State is an achievement of which any one may well be proud, and we congratulate our colleague, Mr. A. Hopkins, on the attainment of this mark of distinction.

The fact that the whole of this service was in an unestablished capacity is something which the oldest member of the Department finds it hard to understand.

Mr. Hopkins was during the greater part of his official career employed as a mechanic in the Factories Department. As such he was engaged in the making, testing and repair of high-speed apparatus. Actually he was associated with the development of fast Wheatstone working, taking part in, and helping to carry out most of the experimental work in this direction. His experience was such that he was regarded rightly as a Wheatstone expert. For the last 10 years he was attached to the Instrument Testing Branch of the Engineering Department.

On the occasion of his retirement on Jan. 9, 1922, Mr. Henley, Staff Engineer, on behalf of the staff of the Instrument Testing Branch, presented Mr. Hopkins with a gold albert and with a gold brooch for his wife, as slight tokens of the esteem in which he was held by his colleagues.

A feature of the proceedings were the sentiments expressed by the various speakers testifying not only to the ability of Mr. Hopkins, but to his integrity and to his willingness to place the benefit of his knowledge and experience at the disposal of the younger members of the staff.

On Feb. 24 the presentation was completed by handing Mr. Hopkins an illuminated address signed by 107 of the staff attached to the Test Section, Studd Street, and Holloway Factory.

THE EDINBURGH TELEGRAPH AND TELEPHONE SOCIETY.

THE above Society held its monthly meeting on Feb. 28, Major A. A. Jayne in the Chair. A discussion "That temperamental suitability should be the first essential qualification for promotion," was opened by Miss A. R. Douglas, followed by Miss M. D. Moffat. There was again a large attendance, and an interesting discussion took place. The following are some of the points made during the discussion.

Miss Douglas: "In an individual sheer ability without the saving grace of sympathetic consideration of human nature should be ignored. I do not make a claim for the tolerance of inefficiency. Administrators in the service who have themselves been elevated first by virtue of temperamental suitability have it in their power to develop not only happier co-operators in the work of a public service, but a state of real efficiency as a direct result."

Miss Moffat: "The problem seems to be that with the ideal in view we must treat our present difficulty by training those who, against their wills, have been crowded into Post Office life and have little or no means of escape. Temperament is a very subtle thing, and it would be difficult for selectors to assess it in varying individuals. May not the necessary temperament be developed or even created? The training would naturally contain a new concept of the place of the Supervisor. Is he there as the master's watch-dog or as a policeman—or is he there as a guide and consultant to whom to turn in difficulty, whose training enables him to straighten out tangles, deal with a refractory individual (public or official) in the ablest manner, and generally to make him captain of the team. It is pleasing to note that such a vitally essential qualification as suitability of temperament has been organised by the National Whitley Council, in their scheme of promotion. With men and women at the heads of our departments possessing personality, enthusiasm, practical knowledge and powers of leadership and of organisation, Post Office conditions will be revolutionised."

Mr. Cormack: "If we have two Supervisors both equally efficient, but the one with a suitable temperament and the other not so suitable, we are all agreed that the one with the better temperament is the man who will get better work from the staff. At the end of 20 years' service a man may find that he is really inefficient—all that he can do is to sit down, take a sounder, and take down a message. We have Baudot, Creed, &c., and yet it is possible for a man to be in the service for 20 years and not be able to work the Baudot, Creed or Circulation. The way we can improve that, is by attention to vocational training as outlined by Miss Moffat. If we could regard our Superintendents as captains, I think the point of temperamental suitability would solve itself."

Mr. Ingram: "I have endeavoured to define the word 'temperament,' and find that Chambers's Dictionary divides it into four classes. This word 'temperament' is so very vague that we do not know where we are getting. I agree that efficiency is at the bottom of the whole thing. Efficiency will dominate temperament."

Major Jayne: "With regard to Miss Douglas's reference to efficiency, this must, of course, in its widest meaning, play a vital part in our work. It seems to me most important, particularly for us, a technical side, that we should encourage everybody to be proud of their profession. If we find things dull, as we are sometimes bound to in our daily work, let us make things brighter by making our profession nobler. This Society will, I hope, help towards that end. What we are really trying to get at in Miss Douglas's paper I sum up in the word 'leadership.' I do not think a man is a leader at all unless he has a suitable temperament. A man cannot be a leader unless he is so temperamentally suitable that everybody will follow him. The first thing for a leader to consider is the efficiency of the personnel on his section. He could, for example, ask himself 'Now, first of all, is there anything in this section that, in addition to getting the work done efficiently, is going to make life more amenable to the staff? Are the duties in my section absolutely suitable for the requirements of the traffic? Are the circuits properly arranged to meet the traffic that is coming over them? Do my subordinates in my section regard me as their leader—as a person they can come to in any difficulty—and do they regard me as being somebody who is not only willing, but able to help them?' The leader would naturally try to make himself a properly fitted person to meet all the needs of his section, and such a one would not only be temperamentally suitable from the staff point of view, but from every point of view. Administration as an applied science is, to put it in two words, 'common sense.'"

THE RETIREMENT OF MR. A. E. COOKE.

A notable personality took his leave of official life when Mr. A. E. Cooke, Principal Clerk, of the London Engineering District said "Good-bye" to his colleagues on Feb. 27 last. Mr. Cooke entered the Post Office Service at Cheltenham in 1877. He was transferred soon after to Birmingham, where he joined the engineering department in 1883. In 1887 he removed to Nottingham, and in 1901 was appointed Chief Clerk of the Metropolitan Central District. At that time there were three engineering districts in London, but by 1912 these had been combined into the present London Engineering District and Mr. Cooke was subsequently appointed Principal Clerk. Coming to London at the time when the Post Office were opening their first telephone exchange in London, Mr. Cooke had full scope for his unique organising ability. He has done his part in the development of the telephone service from its commencement with noteworthy success. He was a man of great kindness of heart, and many of his staff will treasure the memory of cheery letters received by them while serving with the colours during the war. Perhaps his chief characteristic was an untiring energy and enthusiasm for his work. The inexhaustible nature of these qualities, which years of service left practically undiminished, was always a source of wonder to his colleagues who unite in the belief that a large part of his power is still latent and also in the hope that the setting of his official sun will prelude the dawn of a bright personal life.

An interesting ceremony took place on Feb. 21 when a large representative gathering of the district staff met at Denman Street to do honour to Mr. Cooke. In the unavoidable and regretted absence of the Superintending Engineer, Mr. McIlroy, the chair was taken by Mr. Greenham, his assistant, who, in a few well-chosen words, expressed personal regret on parting from Mr. Cooke, gratitude for help and advice always willingly given, and best wishes for a long and happy private life.

After tributes by Mr. Freeman, speaking for the clerical staff, and by Captain Hines, on behalf of the technical staff, Sir William Noble, Engineer-in-Chief, on behalf of the united staff of the district, presented Mr. Cooke with a canteen of cutlery and a gold watch and chain in token of their regard and esteem. In doing this Sir William referred to his official association with Mr. Cooke at the commencement of the telephoning of London in 1901. He said that the four hard and strenuous years he spent as Assistant Superintendent Engineer in the London District are the only years he would not like to live over again. He recalled the nine years during which he was in the London District and paid high tribute to Mr. Cooke by saying no chief had a more hard working or a more loyal chief clerk.

RETIREMENT OF MR. T. J. CLARK, CHIEF CLERK, TELEPHONES, NORWICH DISTRICT.

IT is with regret that we have to announce the premature retirement, owing to ill-health, of Mr. T. J. Clark, who has been Chief Clerk in the Norwich District since March 1, 1909.

Mr. Clark was born in Cardiff on April 29, 1864, and entered the service of the old Lancashire Telephone Exchange, Ltd., at 38, Faulkner Street, Manchester, on Dec. 3, 1879, which was eventually absorbed by the National Tlephone Company. Following on a re-distribution of districts, by which Manchester was divided into Manchester, Bolton and Oldham Districts, Mr. Clark was appointed Chief Clerk to the newly created Bolton District with Mr. John Macfee as District Manager, and since then, has held similar appointments at Liverpool, Manchester and Norwich respectively.

MR. CLARK.

Mr. Clark was an ardent literary enthusiast and gave valuable aid to local telephone societies at the various districts in which he was engaged. He has also submitted helpful suggestions in connexion with District Office working, several of which were adopted wholly or in part by Headquarters. Mr. Clark was best known as an ardent musician, and his services in this capacity have been frequently requisitioned in connexion with staff functions, irrespective of the important organist and choir master appointments which he held while resident in Lancashire.

On the occasion of the annual social of the Norwich District Telephone staff which was held at the Café Royal on the evening of March 7, 1922, the gathering was made to embrace both the annual meeting of the staff and a farewell to the retiring Chief Clerk.

On behalf of the staff, the District Manager, Mr. C. F. Ashby, asked Mr. Clark to accept an oak secretaire and a framed photograph of the whole of the staff with whom he was associated, with the best wishes for his future happiness. The District Manager, who spoke in the highest terms of Mr. Clark's services, was supported by various members representative of all Departments of the Norwich District Telephone staff, and, in an interesting résumé of his official career, Mr. Clark responded. Mr. Clark was also asked to accept a gold and pearl brooch on behalf of Mrs. Clark as a small token of the esteem in which that lady was held.

During the evening, an excellent musical programme was provided by members of the staff, Mr. Clark occupying his recognised position at the piano.

The
Telegraph and Telephone Journal.

PUBLISHED MONTHLY IN THE INTERESTS OF THE TELEGRAPH AND TELEPHONE SERVICE, UNDER THE PATRONAGE OF THE POSTMASTER-GENERAL.

Editing and Organising Committee - - - J. STUART JONES. JOHN LEE. J. J. TYRRELL. W. A. VALENTINE. J. W. WISSENDEN.

Managing Editor - - W. H. GUNSTON.

NOTICES.

As the object of the JOURNAL is the interchange of information on all subjects affecting the Telegraph and Telephone Service, the Managing Editor will be glad to consider contributions, and all communications together with photographs, diagrams, or other illustrations, should be addressed to him at G.P.O. North, London, E.C.1. The Managing Editor will not be responsible for any manuscripts which he finds himself unable to use, but he will take the utmost care to return such manuscripts as promptly as possible. Photographs illustrating accepted articles will be returned if desired.

VOL. VIII. APRIL, 1922. No. 85.

THE JUBILEE OF THE SOCIETY OF TELEGRAPH ENGINEERS.

THE outstanding event of the month of February, in the electrical world, was undoubtedly the celebration of the fiftieth birthday of the above Society.

The Society came into existence on Feb. 28, 1872, and by the end of its first year possessed a membership of 110. Of these, many have indelibly impressed their mark upon electrical history, and especially the history of the electric telegraph, thus, Captain C. E. Webber, R.E., and Major F. Bolton (founders), Mr. C. W. Siemens, the Society's first president, (afterwards Sir W. Siemens), Latimer Clark, Graves, W. T. Henley, C. E. Spagnoletti, C. F. Varley, John Bourdeaux, and W. H. Preece. It was the far-seeing Varley who realised that the interests of the Society would have to widen and who prophesied that electricity would some day prove to be the force encompassing every operation in Nature. Thus, wisely guided, the Society changed its name to indicate its wider sphere and outlook and became, in 1880, the Society of Telegraph Engineers and Electricians. Its membership by this time had nearly touched four figures. Three years later, the Society became The Institution of Electrical Engineers, thus throwing off for good any semblance of parochial tendencies or nomenclature. The policy was that of the liberal view, the catholic sympathy, the wider horizon and has tested itself out successfully in its present membership of over 10,000 individuals all keenly interested in one or more branches of electrical engineering.

We tender heartiest congratulations to our contemporary *The Electrical Review*, which featured the jubilee of the Institution so excellently in its special numbers. This periodical is, we believe, the lineal descendent of *The Telegraphic Journal and Electrical Review* which, first appearing in November, 1872, was the only newspaper then extant dealing exclusively with electrical matters.

Telegraphic engineering to-day, it is true, is but one of the many ramifications of the far-reaching science of electricity, although with the more modern developments of the telephone, machine telegraphy, and Wireless systems, the study of high-power electrical production and distribution are more and more becoming part of the regular curriculum of the go-ahead telegraph and telephone engineer. We then, of the telegraphs, may well feel proud of our craft, and are none the less so that our own little branch of electrical science was the pioneer of manifold other electrical developments.

The Institution of Electrical Engineers is the custodian of a fine library bequeathed to its predecessor, the "Society," by Sir Francis Ronalds, who, in 1818 laid the first experimental underground telegraph line in his garden at Hammersmith, insulating the conducting wire by passing it through glass tubing. It has, however, inherited something even more precious, the *spirit of indomitable enterprise*, that spirit which enabled the early engineers with but fragmentary knowledge to overcome both the electrical and mechanical difficulties of land and submarine telegraphy and finally to bridge the Atlantic Ocean with a copper thread. An undying possession, handed down from generation to generation, and still animating those who follow the footsteps of Charles Morrison, the real prophet and seer of British telegraphy; of Cooke and of Wheatstone; of John W. Brett, who laid the first deep-sea cable between Corsica and Sardinia, and who afterwards placed the first practicable submarine cable between Calais and Dover; of the persistent pioneers of trans-Atlantic cable-laying; of the far-sighted Varley; or of those disciples of quiet earnest thought and study like Kelvin, and Fleming, and Crooke and Lodge. We are not unmindful of the earlier pioneers of telegraphy in our own and other countries; Strada of Rome (1572), Lesage, Geneva (1774), Lomond, Paris (1787), Cavallo, London (1795), and Soemmering of Munich (1808). These and many others added their quota by slow and painful advances to the sum total of human knowledge. We have travelled far since the inventions of Soemmering and Ronalds, which needed more than twenty wires wherewith to signal the ordinary alphabet, since those first efforts of Cooke and Wheatstone which needed five, since the next device which demanded three, followed by another which called for but two, and the accidental discovery that led to the abolition of the return earth, thus to the use of but a single line for each circuit. The pace became faster. High speed automatic, for ever to be associated with the name of Wheatstone, the invention of the relay, the duplex and quadruplex systems followed one another or advanced co-temporaneously into use. Gradually multiplex systems came to the fore, whereby two, four, or six telegrams may be simultaneously transmitted over a single wire. These systems were again duplexed (by a present member of the I.E.E.), thus doubling the traffic capacity provided only that the electrical conditions of the line permit. Mark well then the advances made by this evolution! From the painfully slow process by which it necessitated over twenty single wires to carry a single telegram, it has to-day become possible to transmit a dozen such telegrams in at least a tenth of the time and that by the use of but a single wire. Yet one other

Digitized by Google

step have we taken and that the most unexpected. Wireless telegraphy is to-day a practical proposition at hand-speed, or high-speed automatic, with multiplex clear on the horizon. How marvellous has been the progress and that well within the span of a hundred years!

PRIVATE BRANCH EXCHANGE WORKING.

THE rules issued by the Controller of the London Telephone Service for dealing with calls at the extension points of a private branch exchange, which we reprint in another column, admit a wider application than that for which they are designed, and we commend them to the attention of all our readers. Private branch exchanges exist wherever a large office exists, either within or without the Service, and the excellent precepts laid down in these brief rules might with advantage be laid to heart alike by Government officials and the employees of commercial firms. We do not propose to give an allocution on the value of courtesy, of promptitude in answering the telephone, and other well-known telephonic virtues; we will content ourselves with observing that to take good counsel for granted is not necessarily to act upon it, that though we often imagine we know the better way without specific guidance, we sometimes neglect to walk in it.

It is a truism with telephone men that the calling and called subscriber play as important a part in the successful transmission of a call as the telephonist. This is peculiarly the case with private branch exchanges, where negligent attention to calls can make telephoning a misery. We should like to draw especial attention to the maxim: "In no case should a member of the public be obliged to give his message twice to the Controller's office." Change the word "Controller's" to "Smith's," "Jones's," "the General Manager's," or "the Engineer's," as the case may require, and an incalculable benefit to the efficiency of the telephone service will result.

HIC ET UBIQUE.

THE London Telephone and Telegraph Advisory Committee has made exhaustive enquiry into the Post Office system of registering calls, and has issued its report. It is instructive to note the method in which different newspapers summarise the report. Whilst *The Times* and the *Daily Telegraph* give it at some length, the majority of papers condense it very fairly, as follows:—

While satisfied that the Telephone Department is anxious to do everything to ensure accuracy, the Committee does not commit itself to the view that no further improvements towards this are practicable, and recommends that the Department be urged to continue efforts at improvement.

As the result of their visit to the Central Exchange, the members of the Committee were satisfied that the most stringent instructions are given to the operators in regard to registration of calls, and point out that these instructions include the following: "If uncertain whether a call is effective, always give the subscriber the benefit of the doubt."

The report states that the opportunity should be taken to impress upon telephone users generally that the efficiency of the service itself, that is to say, the ease and celerity of working, is a matter which depends as much upon the user, and particularly the person called, as upon the operator.

The *Daily Mail*, however, heads the paragraph "Phone Blunders: Subscribers Charged for 3,273 Extra Calls," omits all reference to the satisfaction of the Committee, and gives a select list of the worst cases of overcharging reported to the Committee. Such is the gentle art of conducting a Telephone Ramp.

THE American Telephone & Telegraph ("Bell") Company's report for 1921 shows an increase of 580,176 telephone stations by their 26 associated companies during the year, in addition to which 9,264 independent companies connected with the system show an increase of 198,108 stations. The totals are:—

Bell-owned	...	...	8,914,155
Bell-connected	...	...	4,466,064
			13,380,219

The development of the Bell system has risen from 1 telephone to every 90 people in the United States in 1900, to 1 telephone to every 8 people in 1921.

A BILL has been presented to the French Chamber of Deputies in the names of the President, the Minister of Public Works, and the Minister of Finance, for the total abolition of the flat rate. The rates proposed are 125 francs a year for areas with up to 2,000 subscribers, 200 francs for areas with over 2,000 subscribers (except Paris), and 250 francs for Paris, plus a charge of 15 centimes per call on the first two cases, and 20 centimes in the case of Paris. The subscriber must make or pay for a minimum number of calls—which is 1,500 in Paris, making the minimum charge for service 550 francs.

THE balance sheet of the States of Guernsey Telephone Department shows that the number of telephones on the system increased by 144 in 1921. The total is now 2,806. The net profit is shown as £811.

TRIOLETS.

I.

The line was engaged
And I couldn't get Maud.
I fumed, much enraged
When the line was engaged,
For I quickly presaged
She was flirting with Claud,
Since the line was engaged
And I couldn't get Maud.

II.

Behold the result
Of frequenting the "Pictures!"
Of that curious cult
Behold the result!
He dares to insult
Nice girls with his strictures!
But what else could result
From frequenting the "Pictures?"

W. H. G.

ABERDEEN ENGINEERING DEPARTMENT'S RE-UNION.

THE engineering staff of the Aberdeen Post Office on Feb. 10 held their annual re-union in the Bon-Accord Hotel. There was a large gathering, presided over by Mr. F. E. W. Cowie, executive engineer. Amongst those present were Mrs. Cowie, Mr. James Fraser, late executive engineer, and Mrs. Fraser, and Mr. David Smith, assistant engineer. After supper, Mr. Cowie referred to the good work done by the whole staff during the recent serious breakdown caused by snowstorms. Mr. James Fraser spoke of the pleasure it gave him of meeting his old friends once again, and complimented the staff on their efficiency. Mr. James Kerr, chief inspector, thanked Mr. John G. Dean, the secretary, and his committee for their success, and Mr. Dean, in reply, said he hoped they had all enjoyed themselves, and wished to associate the names of the committee, consisting of Messrs. C. G. Smith, J. Davidson, J. M'Leod, W. Leith, W. Geddes, G. Smart, and J. Murray, with all the praise that had been given. During the evening songs were given by Miss Ritchie and Mr. Alexander Bain, and were much appreciated. Excellent music was supplied by Mr. Alexander King's band.

TELEGRAPHY IN AMERICA.*

BY H. H. HARRISON, A.M.I.E.E.

(1). LITTLE more than a year ago I had the good fortune to spend three happy months in America on behalf of my company investigating telegraph and telephone methods from the manufacturing and operating points of view. The object of my pilgrimage was very completely attained by reason of the extraordinarily generous reception I received at the hands of the Western Union and Postal Companies, the Western Electric and the American Telegraph and Telephone Companies, and such other manufacturing concerns as the Morkrum Co., E. Kleinschmidt, the Stromberg-Carlson Co., the Kellogg Co., and the Automatic Electric Co.

If any of my audience expect to-night a racy and piquant comparison between what a section of the British press describe as an effete Government administration and the product of private enterprise they will be disappointed. Comparisons are only possible where *all* the facts are known and even then it is as well to be careful. My paper is merely a record of observations. I *will* say however, that I found the telephone service in New York no better than London, and for precisely the same reason, as explained to me, viz., the difficulty of getting suitable operators during the War. Also, another thing that may comfort us all, is that the privately-owned and worked telephone companies had to take steps to raise their rates.

Although, strictly, off my subject of to-night, I cannot refrain from quoting below one of the many interesting posters exhibited by the New York Telephone Co., while I was in that city.

IF YOU WONDER WHY WE ASK FOR HIGHER RATES
READ THIS.

Cable Costs have increased 69 per cent. over 1914 prices.

Pay roll this year is $13,000,000 greater than in 1919.

A switchboard that cost $638,000 in 1914, costs $1,342,000 to-day.

In 1914 we could splice a 600-pair cable for $21.00. To-day it costs $41.00, and so on all the way.

NOW READ THIS.

Our revenue in January, 1920, was $751,291,000; since then it has dropped steadily until in July last it was less than our expenses by $731,670.

WHAT WOULD YOU DO IF THIS BUSINESS WERE YOURS?

One of the first things realised by the telegraph and telephone visitor to America when he has recovered from the truly "stunning" effect of New York City, is the extraordinary part played in the business life of the community by the telegraph branch of the art of communication. Small telegraph offices are dotted all over the streets of the big cities. Every hotel of any size has a Western Union and Postal Co. telegraph counter, and the first thing you hear on entering is the merry click of the sounder, and the "mill" (typewriter). Such hotel circuits are omnibus circuits, having several stations in series and being on the closed circuit system, the only equipment is a key and sounder with, of course, the inevitable "Vibroplex" or auto-dot sender.

When visiting the stockyards of Messrs. Armour & Co., in Chicago, I was told they had their own telegraph system and, at my request, was shown the telegraph office in which about thirty operators were hard at work.

One of the big insurance companies in New York having an up-town and down-town office, has two duplex single-channel Kleinschmidt printing telegraphs and one duplex Morkrum Teletype, for conducting inter-official business. Transactions are rapidly and accurately recorded at the head office, and the service rendered is one that would not be possible with the telephone, at least, in my opinion.

Having noted the extent to which the telegraph is used, I naturally looked for an explanation, and it did not take long to find it. America is a country of great distances. Big industrial centres are situated at anything from ten to thirty hours apart, even on the crack trains. Market fluctuations must be known quickly so that decisions may be made; or orders have to be transmitted at the earliest possible moment to meet sudden unforeseen demands. Herein lies the reason for the extensive use of the telegraph.

So far from the long distance telephone service ousting the telegraph it would almost appear that a contrary tendency exists. This was explained to me by one of the traffic officers of a big telegraph company as follows:—

A definite instruction to buy, sell or dispatch can be transmitted by telegraph more cheaply than by long-distance telephone. An "executive," as a manager or director is termed, once he has made his decision, requires the instruction dispatched at once. When it is on its way to the telegraph office, so far as he is concerned, it is finished with. Rather more formality is encountered when long-distance telephoning is contemplated, which, quite apart from difference in cost, if any, does not appeal. It is only when a heart-to-heart talk is needed that the telephone is used. The big business man of America is frequently a bundle of nerves and any process which is short and direct, provided only it carries no attendant disadvantages, is the one adopted.

(2). As most of you know there are two big companies in America handling telegraph service, the Western Union, and the Postal Co. The Western Union is well known to us all, but it is not perhaps realised that the transatlantic link between this country and the Postal Co., is furnished by its relative the Commercial Cable Co. The American Telegraph and Telephone Co., furnishes leased wire service only, and the same remark applies to other companies whose names indicate the two types of service. I shall refer to such services later. To the telegraph student then, for practical purposes, there are two telegraph administrations competing with one another over one big territory, and a study of their methods reveals two striking differences of policy.

The Western Union, like a huge octopus, spreads its tentacles far and wide. At the little "way" station on the railroad hundreds of miles from civilisation, the familiar blue and white sign can be seen displayed.

The Postal Co., on the other hand, do not carry civilisation to the hamlet. They link up all the big cities and towns of medium size, and messages for the backwoods have to be handed over *en route*.

This is not the only difference in policy. The Postal Co., has remained faithful to hand Morse working. They tried out the Rowland Quadruple—duplex system, and then turned their back on machine telegraphy. All their important routes have wire plant equal in capacity to the traffic to be dealt with, and Morse telegraphy reigns supreme.

The Western Union have adopted machine telegraphy whole-heartedly, and must own the largest equipment of machine telegraphy in the world, if it is not even greater than the equipment of the rest of the world put together. The system adopted is the five unit duplex-multiplex system, developed by themselves and the Western Electric Co., with Donald Murray's patents as a basis. The economies in wire plant which are realised as a result are very great, and here, again, the distances to be covered, are a contributory factor in making the policy pursued a success.

Both companies adopt standard styles in decoration and furnishing of main and branch offices which can be recognised at a glance after a short residence in the country. In comparing the two companies with our own British administration, the observer cannot fail to be struck with the great advantage accruing to them from being "single purpose" utilities.

The hundred-and-one services rendered by the British Post Office makes it difficult to have distributed about a large city innumerable little one-man or one-woman offices with the simple equipment possible where telegraph service is the sole commodity for sale. The single-purpose office can be small and tucked away in any odd corner, provided only it is not out of sight. The usual equipment is a key sounder, counter, small writing desk and two chairs for the telegraphing public, and, of course, a telephone.

(3). A casual examination of the traffic results reveals immediately a rapid service between big cities second to none. The American citizen insists on speed and always has the whip hand of the telegraph company by the threat of transferring his traffic to the hated rival. Both companies are compelled, therefore, to give the best possible service though it would be unjust to suggest that this is the sole stimulus. To all right-minded telegraph people, good service is a tradition and delay to traffic, even where this cannot be avoided, is anathema. I sometimes think that our Continental friends do not feel so strongly on this point as we do, and some things which I have seen in central telegraph offices on the Continent indicate a light-hearted free-and-easy disregard of the telegraphing public rather upsetting to a British-trained telegraph man. There is no indication of slackness in the American telegraph office. "Get on or get out" is, I should imagine, the prevailing sentiment and "keep on keeping on" another. The young lady who was at once counter clerk and telegraphist at the hotel where I lived for some weeks in New York spoke French, German, and Spanish, in addition to her other qualifications, though I cannot say if this is exceptional or general.

The night letter, week-end letter and deferred cablegram were not in force, as a result of the War, while I was in America, but I was told that all these services were to be re-introduced as soon as practicable as they considerably reduced standing charges on wire and office plant as is only to be expected.

Money could be dispatched or received by telegraph as in this country, and this service was exceptionally well carried out. I have telegraphed before breakfast from New York to Chicago for money and received it an hour later without leaving the hotel premises. At times of peak traffic the time might extend to two hours, but even then the result cannot be considered other than satisfactory.

The education of the public in the direction of making them feel the utility of the telegraph, is at once instructive and amusing.

The most remarkable evidence of this propaganda for stimulating the use of the telegraph is furnished by the small booklets issued. These are admirably printed, illustrated and bound, and of a convenient size enabling them to be slipped into the pocket.

(1) "Helpful hints in the preparation of telegrams and cablegrams." 19 pages full of useful matter and with computing tables for calculating message costs.

* Paper read before the London Telephone and Telegraph Society.

Digitized by Google

(2) "Forms suggested for telegraph messages." 24 pages suggesting messages appropriate to all occasions with, however, one omission. There is no telegraphic proposal of marriage included.

(3) "The telegraph gets results." 30 pages, relating instances of effective application of the telegraph in selling, advertising, purchasing, and in the general conduct of business.

(4) "The telegraph in selling." 32 pages. Shows how day and night letters bring results in selling. They are salesmen who require no expenses, no train fares, they do not stop for sleep, or miss trains, and the customer in never too busy to see them personally.

(5) "The telegraph, its history and present development." 23 pages, beautifully illustrated with photographs of the earliest Morse apparatus with, of course, a picture of Morse the man, and the latest multiplex apparatus.

If you are expecting the arrival of friends from England, the Telegraph Co., maintains a signal station at Sandy Hook for the purpose of reporting the approach of in-bound vessels. Long waits at the docks are not necessary, the Company will advise you in ample time to enable you to meet your incoming friends. If you desire to send flowers to your wife, mother or sweetheart one or two thousand miles away, it will be done in an hour or so. You go to the telegraph office and state the amount you wish to pay. This with the cost of the telegram is all that you have to worry about. The florist in the town in which the recipient lives gets telegraphic instructions, and the money, from the Telegraph Co. Correct time will be distributed to your house or factory and a stock ticker news service is available.

(4). Despite the stupendous advance of machine telegraphy, manual Morse telegraphy is very far from a dying industry. I saw many instances of good Morse working, but I did not see anything marvellous. When the visitor first gets within range of a sounder, which is usually within half-an-hour of his leaving the ship, American Morse working sounds very rapid indeed. This is, however, partly illusory. The American code has several letters consisting of dots and when these are sent by vibroplex, they appear very rapid and clear. After a few days residence and when I had managed to substitute the American equivalents for some of our letters, I found that I was able to "copy" from the hotel sounders without any difficulty and that the overall speed is nothing to write home about.

On the bonus wires, that is wires where the operators are paid by traffic results, the Phillips code is used. This is a code of several hundred abbreviations, and though I was told it is officially banned, its use appears to be winked at. With typewriter reception, the receiving operator can always beat the sender; but the Phillips code equalises matters and incidentally increases the speed at which traffic is handled. When we hear of speeds of 40 to 45 words per minute on American wires, these facts have to be remembered.

All Morse reception is accomplished on the "mill" or typewriter. Formerly the operators owned their "mill." Nowadays the company provides it. This is good practice as the type is standard and all messages have a uniform appearance when issued to the public.

Nearly all Morse sending is done on auto-dot senders of the "Vibroplex" type. The operators own these, and the companies maintain them. This, I was told, was found expedient, as a prolific source of trouble at repeater stations was caused by defective contacts on auto-senders. I learned to use this apparatus, but I was not impressed with its advantages for the Continental code, though I had to admit that the American operators' apparently effortless sending on these machines is very good. I was told that many operators could not use a Morse key.

All balancing apparatus for duplex and quadruplex apparatus is placed apart from the instrument itself with special attendants. The instrument room has keys and sounders only. An operator does not know if he is on the A or B side of a quadruplex circuit. In the event of trouble, a key is depressed for a few seconds, after which a lamp lights calling the attendant to the circuit. This arrangement impresses me. The balancing and adjusting is in the hands of trained men and the apparatus is in a quiet clean room where there is no dust arising from the stream of foot traffic, variable it is true, but never entirely absent from a large instrument room. When there is trouble on a "bonus wire," the attendant soon hears of it!

American telegraph apparatus is very different from ours though one can notice a tendency to adopt British apparatus or, I should say, apparatus modelled on British lines. The standard B relay is made in America in very large quantities. It is, however, shorn of much of its glory, the polished and lacquered brass case being made of Micarta tube, and cheaper forms of terminals are used. Nearly all "polar" or "main line relays" are provided with Gulstad auxiliary windings. Apparatus and repeater tables are made of angle-iron with teak shelves. No polished mahogany and gleaming brass here! A stern utilitarian note is struck. The polarized sounder is in use to a limited extent.

The Americans make much fuller use of wire plant than we do, the A.T. & T. Co., leasing the wires of their toll circuits for telegraph purposes. There is nothing startling in the circuit arrangements for doing this. Both Morse and printing telegraph circuits are furnished in this way. No noise whatever due to this super-position is in evidence at the toll boards, but the American telegraph-telephone engineer is fortunate with his climatic conditions.

Balancing of duplex and quadruplex circuits is no longer accomplished by feeling the relay tongue with the fingers. They use differentially wound ammeters made by the Weston Co. These and the American type "B" relay are the best apparatus in the equipment, switches, rheostats and condensers appearing shoddy to English eyes. The American point of view in this respect differs widely from ours, and provided that the apparatus gives good service, its appearance doesn't worry them "any." I have a feeling that in these matters they sometimes go too far in the wrong direction.

(5). Machine telegraphy in America, with the exception of the stock ticker services, is carried out by apparatus designed to use the five unit alphabet. Main line service is furnished by triple and quadruple duplex apparatus while lines carrying small traffic are provided with simplex or duplex "stop-start" systems.

Stop-start circuits are interlinked with main line circuits, resulting in very flexible and efficient methods of handling traffic.

The American multiplex has the following leading characteristics.

(*a*) Distributor motors are of the phonic wheel type driven by massive forks.

(*b*) The distributors are of the single plateau variety having four concentric sets of segments, receiving, transmitting, correcting, and local, the latter for stepping up the tape transmitters and closing printing magnet circuits.

(*c*) Keyboard perforators and tape transmitters are universally used even on single channel stop-start apparatus.

(*d*) Correction is always obtained from the signals.

(*e*) The circuits are permanently duplexed.

(*f*) Printers are of both type-wheel and type-bar patterns, the original Western Electric and the Morkrum belonging to the former, and the Kleinschmidt and "Dreadnought" printer of the Western Electric, the latter all being page printers.

(*g*) Instrument tables are of solid teak or angle-iron frames and legs.

(*h*) All connexions are made up in colour code cable forms.

(*i*) Each piece of apparatus is instantly removable without disconnexion of a single wire.

(*j*) Balancing, synchronising and phasing apparatus together with the distributor and driving fork are all mounted together adjacent to the traffic channels, as in British practice.

(*k*) Time stamps controlled by an electrical-master clock are provided at all operating positions. (The electrically-controlled time stamp is in general use in business houses in America.)

Before considering some of the more interesting technical details, the operating conditions require a little attention.

I found the work of the perforator operators had reached an extraordinarily high standard, a standard that was general and not exceptional. 45-50 words a minute was accomplished with ease, and with remarkable freedom from error. This is largely due to the efficient method of instruction and the insistence on "touch" typing. I was shown over a school of instruction, and the reason for the state of affairs above was at once apparent. From the very start, the operator to-be is not allowed to look at the keyboard, and, to prevent surreptitious peeps, a metal shield is interposed between her hands and eyes. She gropes for the desired character by the aid of a full-sized drawing of the key tops placed in front of her, and certain keys are invariably assigned to the same finger. All fingers and the two thumbs are used, the latter for spacing only. She is first taught to select letters in a row, then the various rows, and suitably designed exercises are given to her. She is also taught to depress the keys at an even rate. The method, which is no method, used in British typing schools, where the student "picks" up a knowledge of the keyboard without any guidance whatever, finds here no place. If only typists would realise how easy their work becomes when they have mastered the "touch method," the bad old way would soon be relegated to limbo. Keyboard perforators seem to me to be less nerve-racking than a typewriter, as there is less noise, and no transmitted shock to the tips of the fingers as when a typebar strikes a typewriter platen.

The Western Union Company have made very thorough traffic studies to enable them to determine the number of circuits and the transmission speed to handle a given volume of traffic.

In America no charge is made for the address, only the text being counted and paid for. The name and address averages 14 words per message (13.93 actually). The average text, which is paid for, amounts to 12 words, while the function signals controlling the distant page printer impose a load of 4.75 words per message. The average message, so weighted gives a total of 30.68 words of which only 12 or 39.1 per cent. is paid for. The earning capacity of the circuit is further reduced by allowances which have to be made.

(1). RQs and BQs equal to 5 per cent. of the total number of messages. The length of an RQ is approximately one half the average message so that an RQ with its BQ amounts to one complete message, but as only five such loads are imposed per 100 messages, the load per message is 30.68 by .05 = 1.534 words per message.

(2). Repetitions of figures involves 3.51 words per message.

(3). Signals for re-runs, re-punch, start, stop, reduce the capacity per channel by about 0.2 words per minute.

(4). Loss of capacity due to re-run messages before they are completely transmitted is about three messages per hour.

The equated length of a message is thus:—

$31.00 + 1.65 + 3.51 = 36.16$ words.

Digitized by Google

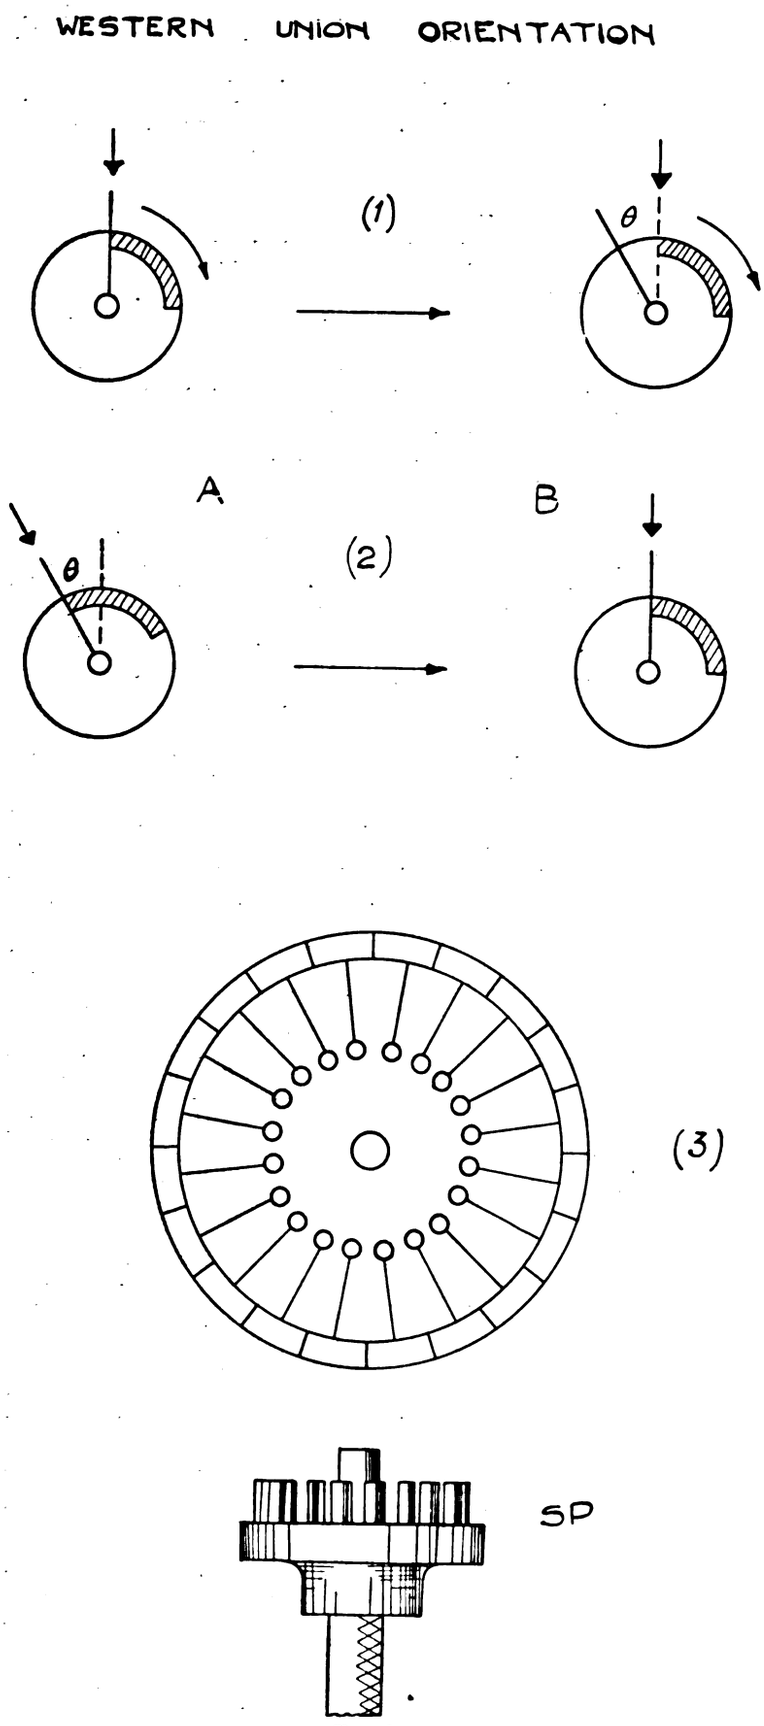

FIG. 1.

The capacity of a channel in messages per hour is speed in words per minute multiplied by 60 and divided by the equated length of the message. At 45 words per minute this works out to 45 by 60/36.16=77.7 messages per hour. Taking the average message at 30.68 words the theoretical capacity per channel is 88 messages and the actual capacity is thus 0.88 of the theoretical.

Single channel stop-start circuits when operating on YQ circuits, are on the closed circuit system, and if duplexed on the d.c. plan, only one operator attends to both the transmitting and receiving of traffic. I have seen such duplex circuits on traffic and can confirm that a good operator can manage quite well and without any appearance of strain.

Turning to technical considerations it is not too much to say that American engineers have revolutionised the duplex-multiple system particularly in respect to quick methods of obtaining correct speeds and phase, and it can be stated with perfect confidence that a man needs only to know the routine of the various adjustments without in the least understanding the reasons to get a multiplex circuit going and keep it so. They have learned all that Baudot had to teach, plus ideas from Murray, Crehore and Rowland—or rather Dr. L. M. Potts formerly of the Rowland Co. The system which has emerged is flexible and fool-proof, and far in advance of the European Baudot system. In this work, the engineers of the Western Union, Western Electric & A.T. & T., have taken part, and the modern American multiplex is the product of such men as G. M. Yorke, G. R. Benjamin, W. A. Houghtaling, P. M. Rainey, A. F. Dixon, J. H. Bell (formerly of the British Post Office Engineering Dept.), S. R. Rothermel and others. There are fundamental differences in the American multiplex as used in the Western Union and that made and supplied by the Western Electric.

They both employ phonic wheel distributors and correct from the signals. The Western Union, however, keep to the Baudot clock hand method with the difference, that the epicyclic train can be operated at any part of a revolution and more than once in the same revolution. The Western Electric method is in use in the British P.O., and needs no explanation. It is, of course, a speed correction arrangement. Both systems give very stable synchronism and both adopt the advance and retard correction segments first used by Picard between Marseilles and Algiers. Methods of orientation differ widely in the two systems. The present pattern of distributor used by the Western Union provides for slight orientation of the receiving segments, but this is only used as a refining or Vernier adjustment. The orientation is effected at the transmitting end. Reference to Fig. 1 will make this clear. Sketch 1 shows station A about to transmit to station B. Due to line and instrumental lag a certain time represented by angle O will be required before A's signal becomes operative at B. To ensure correct reception at B, we can (*a*) either move the receiving segments through an angle O in the direction of brush rotation or (*b*) set the brushes backward by an angle O as shown in the sketch. At the moment when A commences to transmit, the *instantaneous* position of the brushes is that shown in the full lines. Instead of adjusting at B by *retarding* reception we may *advance* transmission at A as shown in sketch (2). Here the brush is moved counter clock-wise at A by an angle O so that, correction taking place at the moment when A's brush is in the position shown then after a lapse of time amounting to O, B will run in at 12 o'clock as shown. It is evident that reception will be satisfactory. In this case, the *instantaneous* position of the brushes will always be identical in space. The adjustment at A is effected by connecting all sending segments of the distributor to a circularly arranged set of sockets, as seen in sketch 3. The 20 transmitter levers are connected to wires in a cable terminating in a plug having a row of pins and the plug can be inserted in the sockets so as to secure 1, 2, 3, or any desired amount of orientation expressed in segments. The orientation at A is thus coarsely adjusted and the final desired result secured by B moving his receiving segments slightly. The rotatable sending plug and row of sockets at A is obviously equivalent to angular displacement of the brush arm.

Fig. 2 shows the arrangement for securing orientation in the Western Electric system, and while I was in New York I was privileged to see this apparatus at work.

One advantage of the duplex balance method of securing both-way working is that no propagation segments are necessary on the distributors. Sketch 1 shows the sending and receiving segments at two stations A and B, of which A is the correcting station. Two segments lag is assumed and the distributor at B runs in at the position shown. Reception at A is obviously incorrect. Now it is convenient for reasons which will be clear later to adjust for lag at the corrected station. The reception from the correcting station will be automatically adjusted, but in order that it shall be equally so at A, B must advance his transmission, as shown in 2.

The *advance* of transmission and *retard* of reception at B can be secured by brush orientation as will be clear from the previous figure, and the sketch at the bottom of the figure shows a method for doing this. The motor PWM drives a shaft arranged to control two sets of brush gear sweeping over plateaus or faces DF_1 and DF_2. The brushes are coupled to the motor shaft by an epicyclic train of gears consisting of one mitre wheel supported by a bearing carried on a disc OD_1 or OD_2 which is loose on the motor shaft and normally stationary by reason of friction between its left hand surface and the face of a disc carried by a support mounted on the base. The brush arm carries a third wheel gearing with the idler, and the motor shaft is thus coupled to the brush arm, but rotates in the opposite direction. Now we can effect a shift of the brushes backwards or forwards by momentarily increasing or reducing their velocity with respect to the motor shaft. This speed variation is the function of the discs OD_1, OD_2. If they are moved backwards or forwards and while they are in motion they change the velocity of the brushes and so adjust their phase relation to the shaft in a very convenient manner.

Orientation may be entirely confined to the corrected station with this apparatus and the method is as follows:—B (sketch 2) sends out a signal to A which is received on a set of storing relays arranged to re-transmit the

Digitized by Google

signal to B. B's distributor having previously been put into phase with A, B now adjusts his sending brush until he correctly receives from A the signal he is sending to A. This method is of great advantage when A is a rotary repeater either forked or straight. Each out station orientates as described above, and they will then be correctly adjusted to send through the repeater to the stations they are to have access to.

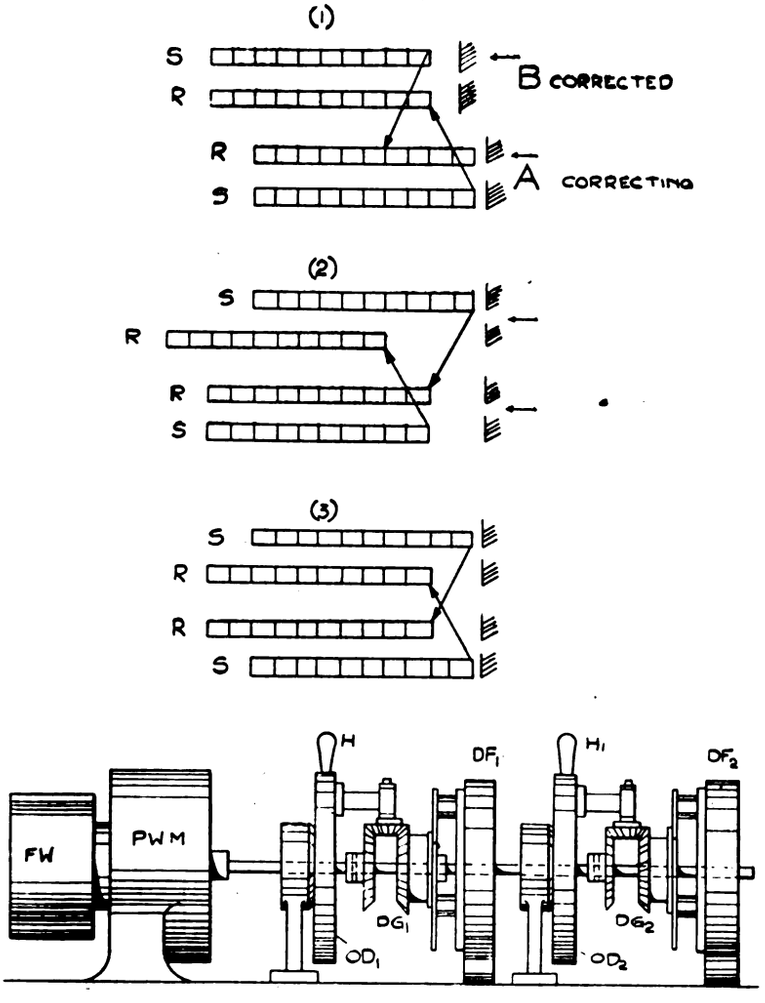

FIG. 2.

Phasing or synchronising is accomplished very neatly. At the correcting station, the distributor having been got up to speed, the twenty printer magnets are switched out and a circular bank of lamps on an observation panel are substituted. If one pre-arranged marking impulse is sent out from station A it will be received on one of the lamps and the brushes are simply orientated until the correct lamp lights up. This is equivalent to the observation of printer slips when adjusting a Baudot set, but is a much more convenient and scientific way of doing it. The same arrangement of lamps forms a stroboscope by which the speed of the motor may be adjusted, but it is the practice to calibrate their driving forks so that the setting of weights, for a given speed of rotation of the phonic motor, is pre-determined.

Sketch 3 shows a case where separate sending and receiving motors are provided at each end of a circuit. This is used where, through want of electrical symmetry of the line, the speed may be different in the one to that possible in the other direction. Orientation of the receiving sectors only is necessary here as there is no reflected line lag to be taken up.

The American phonic motor has a very massive fly-wheel and would take some time to get up to synchronous speed. The Western Union employ a small auxiliary motor for this purpose, but the Western Electric method is shown in Fig. 3.

With the switch S thrown to the right the magnets of the phonic motor receive impulses of current from the local rings LR of the distributor if the brush arm is momentarily rotated. The motor will then commence to rotate by itself still under control of the local rings. The fork offers an alternative path through a synchronising lamp SL which will flash intermittently while the motor is accelerating. When the correct speed is reached, the lamp flashes almost continuously and if S is then thrown, the fork will take up the work of driving the motor.

Rotary repeaters are rapidly coming into use in America. Fig. 4 shows one in use by the Western Union at the time of my visit. The receiving segments are in two groups, one a receiving group and the other a locking or holding group. From the solid rings of the distributor a path to earth is taken through a sending relay SR and a locking relay LR. When a signal from L_1 is received, the main line relay reverses and a marking current is applied to the receiving group of segments and transferred to the relays LR and SR by the brushes. SR sends on the signal to line L_2 while LR applies a marking current to the locking group of segments to hold SR and also itself in the marking position so long as a marking current is coming over line L_1. When spacing current arrives the relays SR and LR go to spacing and are held there by the action of LR. Thus good firm rectified signals go out to line L_2.

The Western Electric Rotary Repeater is shown in Fig. 5. Signals from L_1 are received through the distributor RD, and alternatively, by a pair of polarised storage relays SR and SR_2 and from then repeated to the sending disc SD of line L_2. While SR_2 is being set, SR_1 repeats the signal just stored in it. Notice that SR_1 receives on the odd numbered segments of RD, but transmits on the even numbered segments of SD. This allows the setting cycle to precede the sending cycle by a segment and there is no overlapping of the two functions.

The start-stop system before alluded to is being very vigoriously pushed in America. The Morkrum Co., initiated it, followed by the Western Electric Co., and later still by Kleinschmidt. Time will not allow of discussing this system at any length, but the general principle will be gathered from Fig. 6. The brush arms are frictionally coupled to the continuously running shaft of

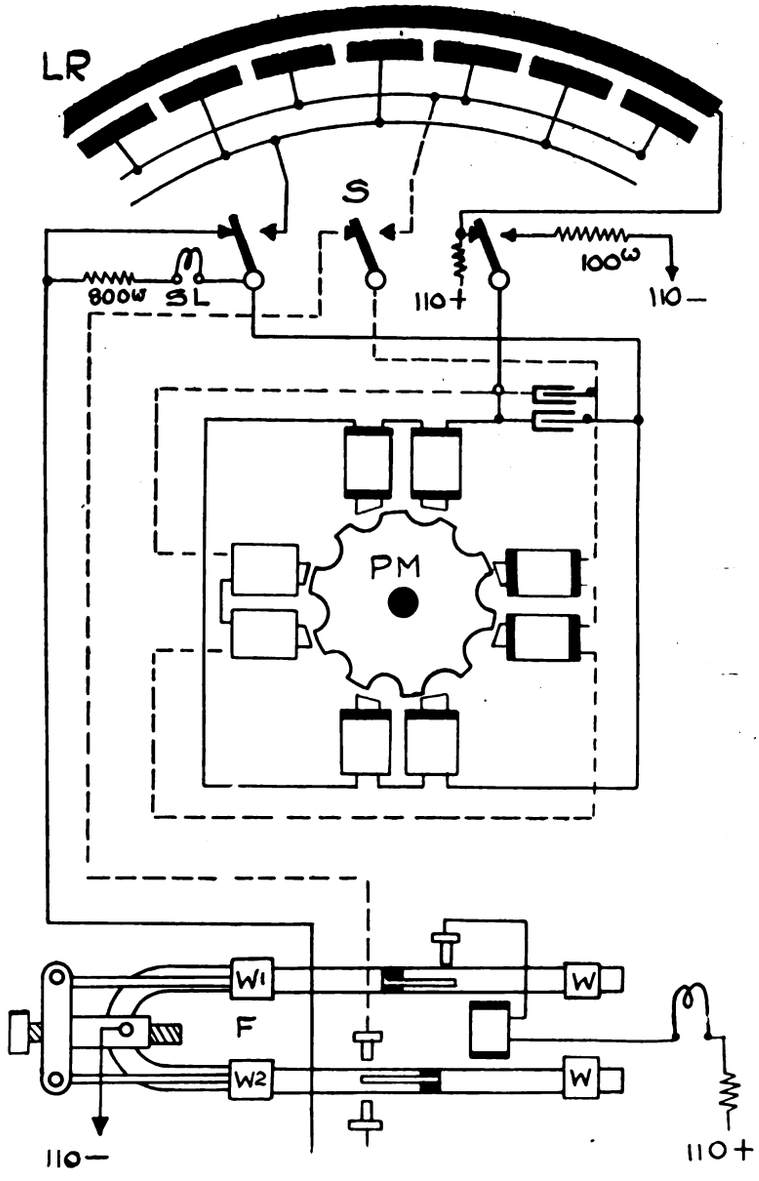

FIG. 3.

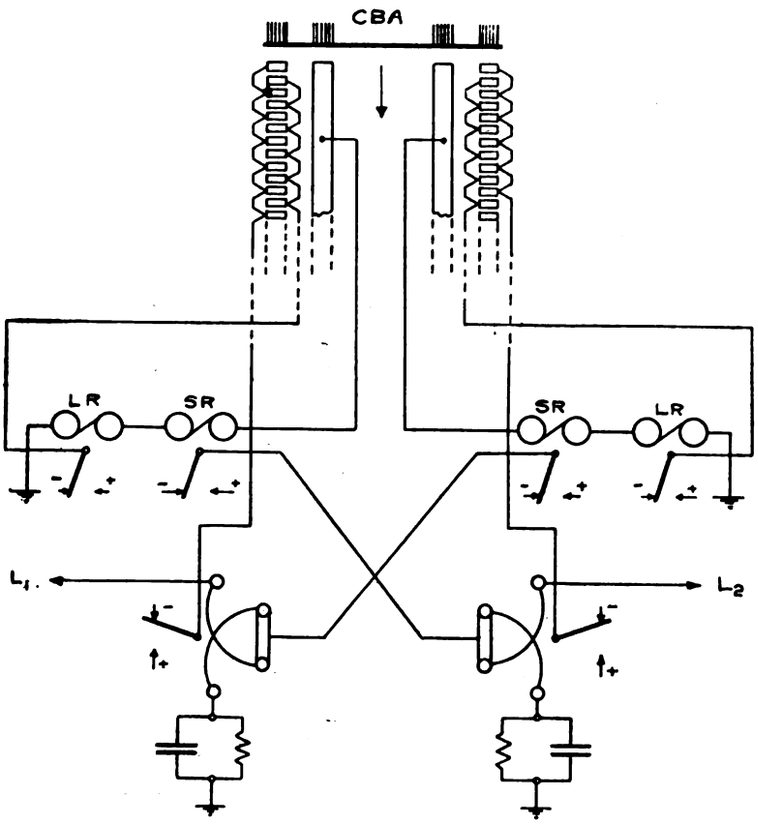


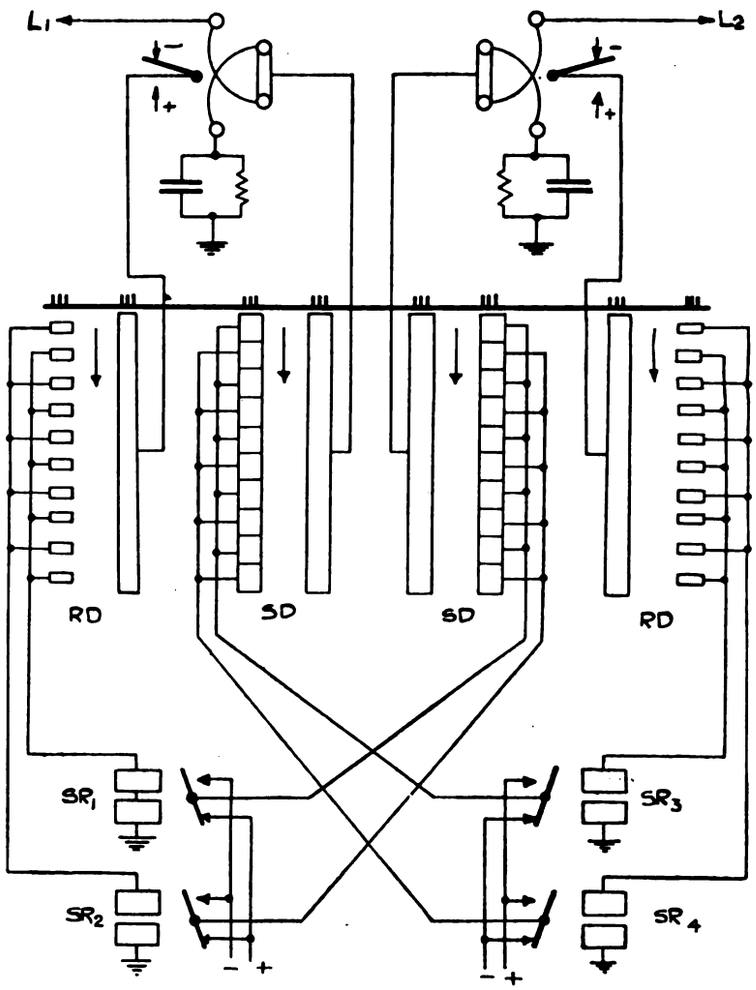
a small DC motor, but are restrained from rotation by means of latches controlled by release or latch magnets LM. When a character is set up at station A to the contact CC which is closed whenever any keyboard lever is operated, LM operates and releases the brush arm. When this leaves segment 6 the closed circuit for the battery in the line—the system shown being arranged for closed circuit working—is opened. The line relay at B releases

Digitized by Google

and closes a circuit for battery LB through the latch magnet. The brush arm at B starts to revolve and sweeps over the segments 1 to 6 in practical synchronism with the brush arm at A. Wherever one of the contacts KBC is operated the line circuit is completed and the line relay LR at B is energised, closing a circuit for the corresponding printer magnet PM *via* its distributor segment, brush arm, battery LB, left-hand armature of relay and the common conductor to magnets PM. No orientation is needed since the effect of line lag on the receiving relay, delays the start up of distributor B and secures automatically the necessary relationship for correct receptions. The motors have a small centrifugal type governor which controls a lever normally short-circuiting a resistance in series with the motor. If the motor speed rises this short-circuit is removed and the motor slows down. The motors are adjusted to the correct speed by varying the tension of spring S and the speed can be examined at any time by means of the stroboscopic disc on the motor shaft. A calibrated tuning fork TF with the usual shutter is struck, and SD observed through the shutter aperture. The maintenance man makes this observation about once a fortnight, and I was told rarely has to make any re-adjustment. The stoppage of both distributor arms at the end of each letter prevents accumulation of phase difference.

(6). Of large American telegraph offices I inspected, the New York offices of the Western Union and Postal Companies and the Chicago office of the former. I also went over the new Chicago office of the Western Union, but the equipment had barely commenced at the time of my visit.

In both companies' offices, dynamos are used in place of batteries, and I came away a thorough convert to this method of operation. The cleanliness of the generator room, the automatic regulation to the load to be carried, and the fool-proofedness of the arrangement impressed me tremendously. The cabling of these large offices, with fire-proof cable in fire-proof ducts, and the system of preparing cable forms for all instrument tables which are about three times the length of our tables, leave nothing to be desired. I was struck by a simple and effective method of concentrating lines with little



ROTARY REPEATER.

FIG 4.

traffic. In place of a big switch with attendant operator, smal panels with about six jacks and lamps are provided at operating positions, and the operator is his or her own switching operator. Lamp signals are used a good deal as a calling means and enable supervisors to readily see an unattended call.

Belt conveyors are extensively used. A belt runs along the middle of each operating table and drops its messages down a shute at the end on to a second belt running just below the floor level, from which the messages pass to the distributing operator. The chase in which the floor belts run is covered by glass panels so that messages slipping off the belt can be seen.

The test boards of a large office have no special points. The equipment is of the telephone type, plugs and jacks, but much heavier than usual. This is necessitated by insulation requirements, as voltages rug high, 200-250 on some circuits.

ROTARY REPEATER

FIG 5.

Lavatory arrangements are beyond all praise, and I have seen nothing like them in Europe.

The lavatories for the messenger "boys" in the New York Western Union cable office are in white marble with nickel plated fittings. The boys (they are in reality young men) can get their uniforms pressed and repaired when off duty by a tailor kept on the premises.

The offices for public use are commodious well lighted and, in the case of the newer ones, actually architecturally beautiful. They form a striking contrast to the average big European office, with its appalling dinginess.

(7). Cable telegraphy in America does not call for special remarks. Great speeds are not aimed at. Amplifiers are used, but mainly to improve the definition of signals. Cable signals come direct into New York. They are read by an operator who sends them on an auto-dot sender to another operator sitting with a receiving sounder and typewriter. This strikes one as wasteful, but I was told it was not so, and it had the advantage that the message went out typewritten. Typewriting direct from recorder slip is slower. Experiments on Trans-Atlantic typeprinting telegraphy were going on and are still proceeding.

Digitized by Google

(8). I had opportunities for investigating the position of Radio telegraphy so far as it concerned long-distance work, but the results at present appear to be disappointing. I was amazed at the severity of the disturbance experienced over that side, we have nothing like it here. I was told that few hours of the day were absolutely clear of disturbance, and, until some remedy is found, high-speed work or Trans-Atlantic telephony is impracticable. The much-boomed devices for interference-prevention have proved very broken reeds and much remains to be done. Nevertheless the American radio people are working with extraordinary energy and if we may pride ourselves in having the lead so far as cable telegraphy is concerned, we shall have to wake up if we want the same proud position in radio telegraphy.

The big station at Long Island was commenced while I was over, but there was nothing to be seen. I discussed the long-distance problem with the many American radio men and they all agreed that much remained to be done before a regular 24 hour service at high-speed could be obtained. When the goal is reached the cables are bound to feel the competition. At present they can smile at it.

AMERICAN START-STOP SINGLE CHANNEL. SYSTEM.

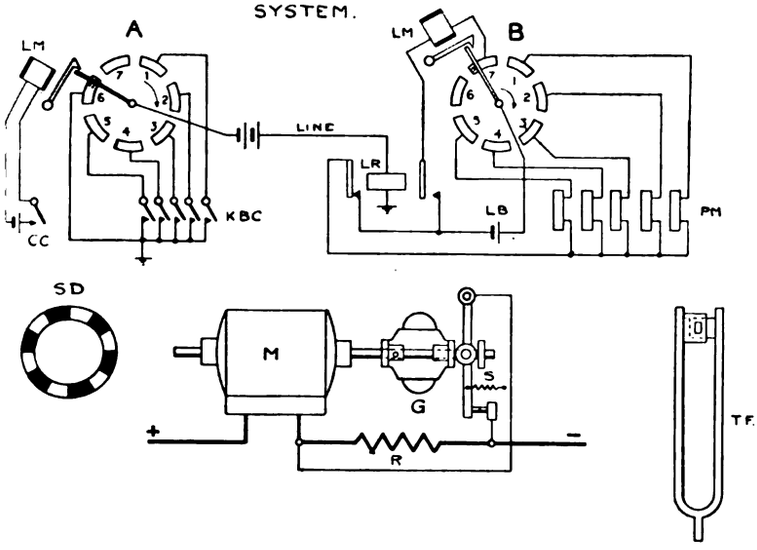


FIG. 6.

(9). By courtesy of the A.T. & T. Co., I saw a carrier current circuit in operation with fifteen separate channels. The telephony is very good, clear and free from foreign noises. The telegraph is really a high-frequency harmonic multiple system made much more efficient by the use of valve generators with their pure waves which, of course, make for selectivity and by the adoption of methods borrowed from radio technique made possible by the high frequencies used. The interference beats which hampered older methods are filtered out by band filters and the results obtained with this new art are impressive. The ordinary calculations from telephone transmission do not seem to apply to high-frequency guided waves, and at the time of my visit a discussion was raging as to the law connecting energy needed and distance attainable.

(10). I have to acknowledge the extraordinary courtesy and kindness of the leading officials of the Western Union, the Postal Co., the Western Electric and the A.T. & T. Co. This welcome was not confined to administration officials. I had a most cordial reception from Messrs. Morton & Krum of the Morkrum Co., from Mr. Kleinschmidt and many other manufacturers.

The manufacturer of telegraph equipment in America is much to be envied by an English manufacturer. Orders such as 1,100 keyboard perforators, 2,000 standard B relays, 200 quadruple duplex distributors permit of an organised and efficient manufacture not possible to those catering for European demands, which can only be termed paltry by comparison.

The American telegraph and telephone industry has live technical journals and I spent pleasant and informative hours with Mr. Donald McNicol, Editor of the *Telegraph and Telephone Age* and others.

H. H. HARRISON,

WEST YORKS SOCIAL AND DISCUSSION CIRCLE.

AT the February meeting of the West Yorkshire Telephone Social and Discussion Circle, eight of twenty three-minute papers submitted were read. The eight papers were adjudged the best in a competition open to all members of the Circle. The paper awarded the first prize is published in this issue.

The judges had considerable difficulty in making their decision, as several of the papers were of outstanding merit. After the papers, there were games and dancing, which rounded off a very enjoyable evening.

SUMMARY AND RECOMMENDATIONS OF THE SELECT COMMITTEE ON TELEPHONE SERVICE, 1922.

IN drawing up this Report your Committee have endeavoured to avoid repeating statements in the two recent telephone Reports upon which they have no special comment to make, or with which they agree, and also have aimed at not unduly prolonging it by including every possible item, large or small, of which there are many, which might conceivably be discussed on home and foreign telephone services. For greater convenience we have attempted to classify our recommendations in some relation to their importance as they appear to us, but we feel that from the nature of the subject the following curtailed summary is almost necessarily imperfect without reference to the specific paragraphs and to the Report as a whole, and this must emphatically be borne in mind.

MAIN RECOMMENDATIONS.

(i) Re-organisation on more commercial lines, and separation of the telegraph and telephone departments from that of mails, and constitution of an administrative board of heads of departments under the Postmaster-General or Minister of Communications.

(ii) Division of the country into telephone areas for healthy competition and financial comparison, with local consultative committees and co-ordination as far as possible of community of interests.

(iii) Greater encouragement of co-operative enterprise where the Post Office do not see their way to develop, notably in rural areas, under Government supervision, with sanction in each case of the Railway and Canal Commission.

(iv) Telephone charges should be reduced with the reduction in the cost of living and cost of materials.

(v)—(*a*) The setting aside of £200,000 annually for *extra* depreciation should be discontinued and the charge for ordinary depreciation should be revised, which would result in a further reduction in 1922-23 of £276,000, with proportionate reductions on the Estimates for future years.

(*b*) Salaries and overhead charges for new construction work and for renewals should be debited respectively to capital and to the depreciation account, not to revenue, which would have meant savings on revenue account of about £400,000 and £186,000 in 1920-21, and will be perhaps more later.

N.B.—These two recommendations together (£1,062,000) represent probably at least 8 per cent. off existing telephone charges.

(*c*) The Post Office telephone accounts should be kept in a more commercial form, and more extensive use should be made of a capital account.

(vi) The basis of the method of charging should be the message rate. The flat rate, although theoretically objectionable, may be admitted as the means of accelerating development in very small places or for residences in certain restricted areas.

(vii) The extra mileage rate should be reduced from £10 to £5 a mile.

(viii) A certain differentiation or elasticity of rate is sometimes advisable where it assists development, and as an example there should be a lower annual installation rental for residences than for business premises.

(ix) If our conclusions are approved, we recommend an immediate reduction of 10 per cent. on subscribers' accounts provisionally and without prejudice to any subsequent re-arrangement to carry out our recommendations.

Digitized by Google

SECONDARY RECOMMENDATIONS.

(x) Judicious extension of automatic telephony.

(xi) More trunk lines and less steeply-graded scale of trunk rates for the shorter distances.

(xii) More latitude in standard of materials to allow of cheaper extension into rural districts.

SUBSIDIARY RECOMMENDATIONS.

(xiii) Following on re-organisation (*a*) disappearance of the office of surveyor from the telegraph and telephone department; (*b*) transfer of the Holloway and Birmingham factories from the Department of the Controller of Stores to that of the Engineer-in-Chief, and (*c*) special care not to detail an unnecessary number of men on one piece of work or to put it through a needless multiplicity of channels.

(xiv) Extension of public call-boxes.

(xv) Fuller permission to the public to employ existing Post Office telephone wires when not in use officially.

Other recommendations are made as to the use of hand-micro telephones for press reporting purposes; retention of telephones on changes of tenancy; lower charges when no night service is given; reduced charge on trunk calls on Saturday afternoons and Sundays; and prolongation of interrupted trunk calls.

Your Committee are very much alive to the fact that the financial success of some of these recommendations is dependent upon a better spirit of co-operation between the Post Office and the public as expressed in § 2. To secure this success a more sympathetic recognition is vital by the Post Office, on the one hand, that the public are human beings with human feelings and frailties, and not mere automatons for making the telephone accounts balance; and by the public, on the other, that there are often real hidden technical difficulties and that an attitude of chronic suspicion does not help to solve them.

THREADNEEDLE STREET B.O. ANNUAL STAFF DINNER.

THE annual staff dinner was held on Friday, Feb. 10, at the Abercorn Rooms, when about 130 sat down to a well-served repast. The chair was taken by the Controller, Mr. J. Lee, supported by Mr. Percy Denham (Vice-Chairman), Messrs. A. W. Edwards (Deputy Controller), D. M. Ford (Assistant Controller), F. W. Miles, W. H. Offord and others. It was pleasing to meet Mr. J. G. Hopgood, late Superintendent, who was recently pensioned, and Mr. E. Fulcher.

The Controller, in proposing the toast of "The Staff" said at length he could meet the T.N.S. staff with the certainty of the erection of the new building. It might be that there were large developments in front of an office having so unique a position in the city as the Threadneedle Street Office. Possibly they would have to discuss the relative merits of machine telegraphs and the Morse system for that office and, therefore, they would do well to maintain an open mind as regards the respective merits. He felt sure that they would all continue to co-operate in every branch of the Central Telegraph Office for retaining the respect and confidence of the public in respect of the Telegraph Service, and that no possibility of improvement would escape them. He had now been nearly three years in the position of Controller and he felt that in that three years we had not stood still. He was more than grateful for the wonderful experience he had had among them all and for the wonderful spirit of cordiality, loyalty and co-operation which had been manifested in the advancement of the Service in which their lives and careers were wrapped up. In wishing prosperity and health to the staff he hoped that they would realise that they formed the vanguard in the march of the future progress of the Telegraph Service, and this idea should provide inspiration to them all.

Mr. D. O. Caldclough responded to the toast in his usual humorous vein. Mr. E. Spencer proposed the toast of "The Chairman," his speech being enthusiastically received.

The musical programme was specially enjoyed and the talent displayed was of a very high order, the staff being fortunate in possessing such personalities as Messrs. Emelyn Jones, Reg Lucas, Frank Hudson, Fred Brown, A. G. Jordan Sam Wheller and A. G. Thain. Miss Bertha Willmott pleased the audience with her light comedy songs, Mr. Arthur Belrose with his humorous pieces and Mr. W. H. Rutt of the C.T.O. contributed to the programme.

THE OLD GUARD OF THE C.T.O.

The Ashburton Club, Red Lion Square, was the scene on Jan. 18 of a delightful and memorable gathering of men now retired from the C.T.O. and its activities. All ranks were represented, though the occasion was one upon which rank took wings unto itself in retirement and only the *man* remained. The gathering took the character of a brotherhood of goodwill, in which the spirit of old times was a predominant factor. It was not the least remarkable feature that nearly fifty old colleagues should be able to meet hale and hearty after their life's work, with a margin of time and leisure for recreation. Many regretfully unable to attend sent their good wishes. Mr. A. Earnes, a former Controller, being one of the number, Amongst those present was Mr. Ben. Packham, who some may recall was compelled to retire some forty years ago through partial blindness. Escorted by Mr. A. McEwan, his reception was affectionately enthusiastic.

An excellent tea was provided in the hall, after which the company made its way to the Club Smoking Room, where the hum of conversation soon became general, here and there knots of old-timers exchanging news of old friends, &c. and thus "getting fresh balances." Impromptu speeches, songs, and anecdotes, of which latter most of the old guard seem to have a considerable store, were succeeded by the singing of Auld Lang Syne, but not before it had been practically decided to renew acquaintances in the summer, probably at Kew.

A. C. M.

MR. G. F. FINDLEY, Assistant Traffic Superintendent, Birmingham, who left on Sept. 21 to take up duty as an Assistant Inspector of Telegraphs and Telephones at Headquarters, was, on the 19th, the recipient of tokens of goodwill from the Traffic and Trunk staffs and the Telephone Cricket Club of which he was captain.

The suit case from the Trunk staff was handed to Mr. Findley by the Supervisor, Miss Chivers, who wished him good speed on behalf of the donors, whilst the kit-bag and case of pipes from the Traffic staff and Cricket Club respectively were presented at a concert presided over by Mr. C. W. Piggott, Traffic Superintendent. The bag in which was placed a wrist purse for Mrs. Findley, was presented by Mr. Piggott and the pipes by Mr. H. Bristow. Traffic Superintendent II, the former speaking in highly eulogistic terms of Mr. Findley's official worth and the latter of his sterling services to the Cricket Club. Mr. Hunter (Contracts) also spoke as an active member of the Cricket Club, and Mr. Findley responded in appropriate terms.

The musical programme was ably sustained by Mr. C. P. Price, Mr. W. Brown, Mr. L. Marsh, Mr. Lowe, Mr. Engleman and Mr. C. Llewellyn, who was responsible for this part of the proceedings. A representative gathering was present, including Mr. Findley, senior, Mr. A. Murray, Contract Manager, Mr. J. Wilkinson, Traffic Superintendent II, Messrs. T. R. Hughes, J. W. Tilley and A. C. Jones, Assistant Traffic Superintendents.

BIRMINGHAM TELEPHONE DEPARTMENT.

Mr. J. S. Rhodes, Contract Officer, Class I, was the recipient of a complimentary dinner, a gold fountain pen and gold pencil on the evening of Feb. 27, on the occasion of his retirement from the Telephone Service.

MR. J. S. RHODES.

In making the presentation, Mr. A. K. Murray, the Birmingham Contract Manager, who presided, referred to the outstanding qualifications possessed by Mr. Rhodes in dealing with the public and to his remarkable trait of character which made him so popular with the staff and with the public. Mr. John Scott, the Surveyor, paid many compliments to Mr. Rhodes on his high standard of business dealings and dwelt particularly on the theme of the pleasure gained in successful dealings apart altogether from an adequate or inadequate remuneration. Mr. P. F. Currall, the District Manager, and Mr. C. W. Piggott, the Traffic Superintendent, also spoke, after which musical honours were indulged, and the company wished health and happiness to "Our Guest."

Messages containing best wishes were received from Mr. Williamson, District Manager, of Glasgow, Mr. Taylor, D.M., Brighton, Mr. Maclure of Headquarters, and other friends.

LONDON TELEPHONE SERVICE NOTES.

London Telephonists' Society.

THE Society held its sixth and last meeting of the session on Wednesday, March 8. Three prize-winning competition papers were read. The first, entitled "A Day in the Life of a Telephonist," was by Miss Dorothy Turner of Regent, a frequent contributor to these columns. It was read by the author in a vigorous and happy manner. She told in realistic fashion of the stars in their courses fighting against her in the morning in her efforts to reach the exchange—and the ubiquitous Radials—in time. "Be it known," she announced dramatically, "that it is easier far to bluff the Angel Gabriel and pass into Heaven, than wangle the demon Radial and punch an early." Miss Turner remarked amidst much amusement that it might interest the P.M.G. and the Controller, who was present, to know that about 75 per cent. of hardest cases amongst unreasonable subscribers claimed relationship with them. The impression the paper left was that such a radiant spirit would get in anywhere, and be granted anything. Truly, if all that Miss Turner related falls within a day's experience, then the average telephonist does not suffer *ennui*.

The second paper was by Miss J. G. Graves of Toll Exchange. The subject was "Reminiscences of the Operating School," and it was told in an interesting way, how her first feelings of confusion at so much that was strange and new were subsequently restored to correct orderliness.

The third competition paper was read by Miss J. McMillan of the Traffic Branch. Miss McMillan has cultivated the habit of carrying off a prize each year and her effort this year, as formerly, was in logical form, entitled "Trial by Jury," in which an erring subscriber is tried for his misdemeanours. Amongst other crimes:—

"Though much indebted to the State,
He railed against his lawful rate;
Demanded, too, a large rebate,
Or else advance of his rental date.

The allegation is that he
Refuses to consult the free
Fair preface to Directory.
And graver still, let all agree,
He will not roll the "R" in three.

Finally, the Judge, after hearing evidence, addresses the prisoner:—

Prisoner, you may go,
But don't ingratitude show
By any disaffection.
And whether soon or late,
Always co-operate.
(Plus a rising inflection)
And if you cannot capture
That first fine careless rapture
Of "R's" rolled roguishly,
The Court will make an order
To take you o'er the Border
Where many "R's" there be.

* * * *

During the evening several short essays on interesting official experiences were read, and prizes were awarded to Miss Elsie Cave of Hampstead Exchange, Miss M. Porter of Regent Exchange, and Miss G. L. Williamson of Dalston Exchange.

The proceedings terminated with the presentation of prizes by the Controller, Major G. F. Preston, C.B.E. The Society is fortunate in having this function performed each year in such happy mood by the Controller, who so obviously enjoys this opportunity of sharing the staff's recreations.

The Society has had a most successful session under the presidency of Mr. M. C. Pink, assisted by Mr. E. S. Thirkell as secretary, and chiefly owing to their efforts, next year's president, Mr. G. Buckeridge, will take over a going concern.

* * * *

Culled from the Exchanges.

Mayfair Exchange.—A most successful whist-drive was held at the Cabin Restaurant, Strand, on Feb. 28. The Mayfair staff and friends have the gift of enjoying things to the full, and were not backward on this occasion. Mr. Howe of the engineering staff made an admirable M.C. The ladies' prizes were won by: 1st, Miss Bird, 2nd, Miss Tringham, 3rd, Miss Maggs, half score, Miss Dempsey. Gentn.: 1st, Mr. Fitchett, 2nd, Mr. Holdway, and 3rd, Miss Amay (playing gentleman), half score, Mr. Hollis. The Committee hope to arrange another drive during April.

The Mayfair Dance.—A most successful carnival dance was held by the Mayfair Exchange on Saturday, Feb. 11, at Holborn Hall. The hall presented the appearance of a dazzling kaleidoscope, for the brilliance and variety of costumes displayed by the medley of dancers was added to by the varied hues of the balloons which they trailed aloft. The costumes were certainly most successful and effective as the fancy dress parade proved. We congratulate all and would especially mention the winners of the originality prizes,—Miss Overed as "Coal Black Mammy," Mr. Hiscock as the multilated recipient of the "*Daily Chronicle* Insurance Benefit." Other prize winners were Miss Shearman as "Aladdin," and Miss King as a "Harem Lady," Mr. Cooper as "Pearly King," and Mr. Vaughan as "Harlequin." Mr. Coombs "Bon Accord Band" especially amplified for the occasion, performed with their customary zeal and charm. We feel sure that all present readily join the M.C. in according his thanks to the committee whose efforts had received such success and we feel that they join us in thanking Mr. Collins for so kindly officiating as M.C.

Paddington Exchange.—On Saturday, Feb. 11, the Paddington Exchange staff gave their annual tea and entertainment to the poor children of the district. The children attending the L.C.C. School in Cosway Street were the invited guests and over 300 tickets were distributed. By a quarter to four the helpers had everything ready, the tables looked very pretty with their varied artistic colours, gained by green tea-cups and saucers, coloured bon-bons and a jelly in its own pretty case, for each child. The children were marshalled to their places and at a word from the school-master said Grace and set to work on the good fare provided. Soon, however, in answer to an S.O.S. the helpers raided the store-room for more, and plate after plate of cake and other good things were rapidly disposed of. The musical entertainment following was provided by members of the exchange staff under the direction of Miss A. L. Powell, who formed themselves into a pierrot concert party. Judging by the hearty response "to join in the chorus," the children fully appreciated each item as it was rendered. As the children left, a bag of fruit and sweets and a golden penny were put into their hands, and all went home having thoroughly enjoyed themselves. A subsequent letter of hearty thanks from Mr. Mortimer, the headmaster, is an eloquent testimony of the appreciation of the school authorities and the children of this effort on the part of the Paddington Exchange. The committee wish to thank all those who in any way contributed to make the afternoon an unqualified success.

Regent Exchange.—The usual order of things at Gifford House, Roehampton, were pleasantly reversed on the occasion of Feb. 18, when Regent was invited to a tea and concert given entirely by the men and nurses as a means of showing their appreciation of the many occasions on which the girls have entertained them. Fifty were able to respond to the invitation, and spent an exceedingly enjoyable afternoon. A very talented performance was given by the Gifford House Orchestra and Concert Party. Regent desires to express its sincerest thanks to the men for their kind thoughts and good efforts.

A dance was given by Regent at the Shaftesbury Hotel, on Feb. 23, and was attended by even more than the usual measure of success and enjoyment. Mr. Buckeridge was M.C.

The social given by the Regent Swimming Club on March 1 was one of the merriest little functions of the season. The programme showed a pleasing variety of items, including coon songs by an infant girl in costume, a short play and songs by members of the staff. Financially too, the social was a great success.

Maryland.

Of course its very topical, but what we want to know
Is will it *stop* at Maryland, or will they make it so
The next Exchange is Tennessee or maybe Ohio?

And will telephonists be called "some great big baby girls?"
Or "honey-bunch," or "kid" perhaps, or "peach with teeth like pearls?"
And is it on the cards that we shall wed with belted earls?

Must we repeat our numbers, since this trans-Atlantic craze,
With a syncopated hiccup in the middle of the phrase?
And may we keep on chewing gum and sucking sugared maize?

Of course with these conditions we can call the male staff "guys,"
I s'pose they're scarcely "doughboys" now they never got a rise;
But, if we've *got* to imitate the Yanks—please "put me wise."

DOROTHY TURNER.

Sydenham Exchange.—On Feb. 11 instant the Sydenham Exchange staff gave a tea and entertainment at Wesley Hall, Lower Sydenham, to 120 poor children. Tickets of admission were kindly distributed through the agency of the Salvation Army and a local missioner. After tea the children were entertained by a ventriloquist and games were indulged in, followed by choruses sung with much energy to concertina accompaniment. Before departing each small guest was the recipient of a toy from the bran tub and a bag of eatables.

Trunk Exchange.—The ancient order of London Trunkards met for the second time on Monday, March 13, to greet their late chief, Miss Breden, on her annual visit to London before her return to Yorkshire. Her reception expressed the very sincere affection still felt for her by her old staff, and was also shown by the flowers presented to her from the day and night staffs. They mustered 89, 40 of these still in the service, including Mr. Trayfoot and Mr. Pink, and also traffic and night staff officers. There were three members who claimed to be the earliest associated with Miss Bredon in the early building up of the Trunk Exchange, and quite a number who commenced their career at the Central Telegraph Office. The most senior could remember an earlier chief, Mr. Covington, but Miss Breden held office for the longest period on record, and her influence together with Mr. Trayfoot's, is the foundation of the high ideals of duty, loyalty and comradeship which permeate the present day efforts.

MANCHESTER TELEPHONE SOCIAL CLUB.

THIS club held a very successful fancy dress masked carnival at the Grand Hotel, Manchester, on Friday, Feb. 10, 1922. All sections of the Telephone Service were represented, and a very enjoyable evening was spent. The dancing floor presented a brilliant spectacle with its gay throng of revellers. In the absence of their president, Mr. Wallace, through sickness,

Mr. Stewart (District Manager) and Mrs. Stewart, Mr. Staite (Traffic Superintendent) and Mrs. Staite, assisted by Mr. and Mrs. Bailey (Grand Hotel), officiated as judges of costumes. Their task was by no means an easy one, but the final selections met with unanimous approval.

Mr. Hollerton's orchestra contributed in no small measure to the success of the evening, and the dancing programme was ably carried out by the M.C., Mr. G. Butler. Great credit is due to the organisers, Messrs. H. W. Short and H. K. Hamilton, Chairman and Secretary respectively, assisted by a hard-working committee.

MANCHESTER TELEPHONES—RETIREMENT OF MISS HAWKINS.

THE passing of the Trunk Supervisor, Miss Hawkins, into the ranks of the pensioned owing to ill-health marks a period in the annals of the Telephone Service, for she has been intimately connected with its development for many years. Miss Hawkins was a Supervisor under the National Telephone Company and came to the Post Office at the transfer of the Trunks in 1897. Since that date her large experience and exceptional ability have been devoted unstintingly to the service, and it is generally recognised that these have been of the highest value to the Department.

MISS HAWKINS.

Feb. 27 was the occasion of a social gathering held in the Houldsworth Hall, when Miss Hawkins' "girls" past and present, together with friends from other exchanges and other branches, were present in large numbers.

During the evening, the Surveyor, Mr. Maddan, presented Miss Hawkins with a gold wristlet watch from the Trunk Supervisors, an easy chair and a reading lamp from the Trunk Exchange staff, and a cushion from the Engineering staff, with expressions of goodwill and wishes for health and happiness in her retirement. She had, on other occasions, received a clock from telegraph friends, a satin eiderdown travelling rug and ebony brushes from the staff of the Traffic Section and the Supervisors of the local exchanges.

Letters were read from Mr. Sanderson, Controller of the London Postal Service, formerly Postmaster-Surveyor, Manchester, Mr. John Lee, Controller Central Telegraph Office, and Miss Chippendale, Trunk Supervisor, Leeds, regretting inability to attend.

Mr. Maddan, in his remarks, said that he had known Miss Hawkins by repute before he came to Manchester, and he spoke of her unusual record in supervising the telephone exchanges in Manchester at the age of eighteen, whilst Mr. Stewart, District Manager, referred to her reputation as a Trunk authority, not only locally but throughout the United Kingdom.

The other speakers, Mr. Wadsworth of the Telegraphs, Mr. Staite, Traffic Superintendent, Miss Johnson, Trunk Supervisor, Liverpool, and Mr. Jackson, of the Engineers, have been associated with Miss Hawkins in varied capacities and all paid tribute to her capabilities and her untiring efforts for the well-being of the staff. Miss Hawkins briefly replied, and the enthusiasm of those present was audibly expressed.

Once more through these pages, we wish for her many years to enjoy her well-earned rest.

PERSONALIA.

LONDON TRAFFIC STAFF.

The following officers have resigned for marriage during the month of February :—

ASSISTANT SUPERVISORS, CLASS II.

Miss M. E. TAYLOR, Regent.
Miss F. A. CLARKE, Regent.
Miss E. A. BULL, Regent.
Miss E. L. BISHOP, Avenue.
Miss B. BRYANT, Gerrard.
Miss S. E. EARLE, Holborn.

TELEPHONISTS.

Miss I. C. COLLINS, City.
Miss E. E. LOWRY, City.
Miss C. E. WALLER, City.
Miss W. BROOKER, Regent.
Miss H. B. LONSDALE, Regent.
Miss D. R. H. COLE, Regent.
Miss G. G. KEENE, Regent.
Miss D. A. HILLIER, Regent.
Miss HAVELOCK, Victoria.
Miss NORRIS, Victoria.
Miss M. B. A. JOHNSON, Victoria.
Miss W. ARNUP, Avenue.
Miss A. C. LUSCOMBE, Avenue.
Miss E. M. FREEMAN, New Cross.
Miss E. R. ADAMS, Sydenham.
Miss F. HADDON, Gerrard.
Miss M. L. COX, Gerrard.
Miss A. E. SPARKES, London Wall.
Miss D. H. WOODFORD, London Wall.
Miss M. D. BOLTON, London Wall.
Miss V. E. WETTEN, Hammersmith.
Miss A. BOND, Mayfair.
Miss D. SPRATLEY, Paddington.
Miss E. SMITH, Paddington.
Miss E. M. THOMAS, Central.

COMING EVENTS.

April 24.—T. & T. Society. General meeting and paper by Mr. A. B. Hart (Asst. Staff Engineer), "High-Frequency circuits."

FOOTBALL.

April 13.—Centels (2) *v.* Victoria United. Away.

ANSWERS TO CORRESPONDENTS.

Harry.—As you will see from Memorabilia, the Imperial Cable, English end is landed at Mousehole, Mount's Bay.

Radio.—Yes, wireless between this country and Hungary is actually a *fait accompli*, but the service is not at present a very regular one, owing to conditions not governed by our own island.

Cableite.—The entry on page 522 of *Whitaker* is of course, quite inexact when it states that "the submarine telegraph cables connecting the British Dominions and Foreign countries, are maintained and worked by private companies. We were surprised to see the statement in a publication generally so very reliable.

A DAY IN THE LIFE OF AN AVERAGE TELEPHONIST.*

BY DOROTHY TURNER (*Telephonist, Regent Exchange*).

LEST this topic should be deemed too ordinary to prove of interest, let me hasten to affirm that each and every day is cramfull of incident, if only we had time to notice it. A fellow feeling makes us wondrous kind, and it may give a certain little satisfaction to know that our daily adventures, good and otherwise, are shared by those around us. This shall be a perfectly truthful account, and may the powers that be close their eyes to the relations herein.

Time: 6 a.m.

Place: An average bedroom, conspicuous in which is a red-haired "Fumbs Up," scantily attired in a jade green bow, a huge glass powder bowl, and an alarm clock.

Dramatic Personæ: You—me—or any telephonist.

Brrrrrrr! Oh hateful, fateful sound! The insistent, brazen notes of the alarm spurs you reluctantly to open one eye and look at the time—Six o'clock! No need to hurry, you think, turning over. Another quarter of an hour in your warm, snug bed will do you the world of good, and there will be plenty of time for you to be right in the exchange by five minutes to eight. You close your eyes for exactly two minutes—wake in terrific alarm, and discover you have slept soundly for nearly half an hour! In a fever of haste and fright, you wash and do your hair in the style which is popularly known as the "eight o'clock chuck-up." Your mother, with privileged intimacy, tearfully implores you "not to go out on an empty stomach," so you swallow a cup of tea and a piece of bread and butter, mentally praying that a benevolent supervisor will permit you a "casual" at ten o'clock to get a glass of hot milk.

When you get to the top of the street a horrid suspicion comes to you. Hastily you search your bag. Yes, you remember now, you have left your keys dangling from your drawer, which you are obliged to keep locked on account of your sisters taking ways with your blouses and handkerchiefs.

And what is a telephonist without her locker key? One might just as well try to imagine a certain cinema comedian without his funny feet and baggy trousers!

Back you rush and wait an age on the doorstep for your sister to put the towel round her shoulders and open the door. Making sure that you are quite complete this time, you sally forth again, and catching sight of the church clock, feel quite reassured to find that it is not nearly so late as you thought it was, so you feel entitled to slacken down a little.

You arrive at the tube station in good time. The lift, as usual, is out of order, so you run downstairs. The sound of a train in the distance spurs you to a frenzy of effort. You almost fall on to the platform—to discover the train is going the other way. Then—Oh! horror!—you see flaunting you in malevolently brilliant letters, "Next train passes this station." "Ugh!" you bitterly reflect, "Of course it does. No train ever stops at this station when *you* want it!" Sure enough, the next train does pass through. You get well to the edge of the platform, risking instant destruction in your determination to board the next train. It enters the station with a defiant whistle, and—also passes through, a non-stop from the terminus to Timbuctoo.

Of course, the next train passes through, that, it seems, is only natural. By this time you think the world is made up of rushing trains and people calmly standing reading newspapers. *You* seem to be the only one in a hurry. You *dare* not look at the clock. In due course a train enters and leisurely draws up. The people on the platform are galvanized into action. You fight for dear life and a precarious position on the footplate of the train. Gradually you are forced into the carriage. Nobody offers you even so much as the share of a strap. You are closely wedged in with your nose pressed against somebody's back. Outspread newspapers find rest for their corners in your eyes. Now and again you catch a glimpse of a notice which advises you to "travel in comfort." At the end of your journey you steal a frightened look at the clock. Three minutes to eight! With good luck you can just do it. The lift attendant bawls "Next lift, please!" but you are a desperate woman, so you slip under his arm and mix with the crowd

In a flash you reach the exchange, tear off your hat and coat, adjust your instrument and rush to punch "On duty," for, be it known, it is easier far to bluff the Angel Gabriel and get into heaven, than it is to wangle the

* Prize paper read before the London Telephonists' Society.

Digitized by Google

Demon Radial and get in early. Viciously you punch—breathlessly you look—eight o'clock exactly! A glow of lovely satisfaction passes through you—you have "just done it!"

The sleepy-eyed night staff thankfully depart, and from eight o'clock until five minutes past, you gather yourself together, breathe freely and surreptitiously "do up" little ends of hair. Then you test the cords and busy-backs. Of course, every other cord is L.G.* Whereupon you earn the wrath and contempt of the exchange inspector and his youthful minions—for whenever they appear, the cords seem to have mysteriously come O.K. At eight-thirty and nine o'clock fresh batches of your colleagues appear, and you enquire after each other's health and feelings, and comment on new blouses and jumpers *in between* answering the few desultory subscribers who call so early in the morning. After nine o'clock you become more occupied in taking calls. At nine-thirty, a heaven-inspired supervisor grants you your prayed-for "casual." A glass of hot milk or a cup of Bovril works wonders and you return ready and fit for anything.

You have your own position, you know your subscribers from A to Z. You know exactly which is reasonable and which of them need to be answered *before* they lift the receiver. You are familiar with their numbers, and you work steadily with a liberal application of the "rising inflection." Life seems to be nothing but a perpetual series of "pushings in," "pullings out," and "pressings down." Yet you are quite happy. You feel like work and you want to be busy. An occasional encounter with an impudent office boy, or an old lady tied up in a call office, enlivens the proceedings a little. Presently a really poignant incident calls forth an indulgent smile for the unreasonableness of the male sex in general, and subscribers in particular.

It is something after the following:—

Impatient Subscriber (flashing furiously ten seconds after challenge): "They haven't answered me, miss."

Telephonist: "I'll ring them again."

Impatient Subscriber (five seconds later in an irritatingly plaintive voice): "Are you going to give me my number, or shall I write to Preston?" (Apparently he thinks by mentioning Mr. Preston with such familiarity he will reduce the telephonist to a state of abject submission).

Telephonist: "I'll ring them again, will you please repeat the number?"

Impatient Subscriber: "I shall *not* repeat the number. You ought to know it. It is your business to remember my numbers."

Telephonist changes junction and finally advises "No reply."

Impatient Subscriber (resignedly, more plaintive than ever): "Very well then, I shall have to write to Preston after all, and God knows I'm busy enough!"

And this, oh! heavens, is a perfectly true story. I wonder if the Postmaster-General and Mr. Preston would feel flattered if they knew that three-quarters of the troublesome subscribers claim to be closely related to them and use the relationship as a threat to have questions asked in Parliament every time they get a wrong number? At eleven-thirty, the exchange presents a scene of pleasant animation. Fresh telephonists come on duty and you are relieved for lunch. There is little time—three quarters of an hour—and it passes so very quickly. Oh! would that every other three quarters of an hour during the day would be as brief! At twelve-fifteen you return to relieve others—the Radial still grimly keeping guard over your exits and entrances. About one o'clock there is scarcely a subscriber calling, and you are beginning to feel the effects of early rising and a good dinner. An insistent drowsiness pervades you. Your head nods in spite of yourself. If only you could get up and run about—if only something would happen. Its no use, you simply *must* go to sleep. Then—a hand on your shoulder—a voice in your ear—"Miss Smith, you are wanted by the chief." In the short distance from your position to the chief supervisor's desk, your past life rises up before you. You mentally review all the small occasions on which you have surreptitiously fallen from grace. Surely nobody saw you when you—no, perish the thought! But what on earth can the chief want you for? You haven't been late for weeks and weeks. After all this agonising, the chief is very nice to you and only wants to tell you a belated increment has been granted. The news is sufficiently pleasing in these riseless days—moreover, it has certainly had the effect of thoroughly rousing you. When you return to your position you find the betting subscribers are becoming active. How you hate them, you think: how you wish they would lose their money until they could not afford a telephone. Full surely betting *is* a vice. Their voices appear coarse and avaricious in your ears, and their dreadful impatience gets on your nerves. Still, it is all in the day's work, and you "carry on" quite happily.

Three o'clock with its promise of tea is the next landmark in your day. A tiny quarter of an hour and you are back again, hard at work and gradually paying the penalty for swallowing a scalding cup of tea and eating new bread and butter in so short a time.

Only another hour and a quarter and you may go home. The last half hour is unbearably long. You simply cannot keep your eyes from first one clock and then another. At last it is four-thirty. You are relieved, and hasten to give the old Radial the most joyous punch of the day. With a tremendous sigh of relief you take off your instrument feeling that you could not have possibly worn it another second. Oh, it's good to be going home.

* L.G. = Permanent Glow.

Your return tube journey is accomplished with ironical ease, considering you are not now restricted to time.

Arrived home, you have another tea, this leisurely and in comfort. Then, happily and thinking you've a nice long evening before you, start upon many little jobs which have long demanded your attention. You iron some blouses, finish a jumper, mend various articles of apparel, help with the washing-up and do a little hurried shopping for your mother. Then you preen yourself and powder to look really beautiful for the one person in the world who really matters.

How completely you have forgotten telephones and subscribers! Some music and singing. Reading and discussions. Even dancing to the gramaphone if mother is out and you can turn up the carpet.

Your long evening goes far quicker than the hour and a quarter between "tea in" and "off duty," alas! Then, if you cannot prevail upon your brother, you clean your own shoes and leave your gloves, bag, everything, in readiness for the morning. Upstairs you make a face at the alarm clock and sleepily think "Thank goodness, I'm nine-thirty to-morrow." Then all is silence and the "Fumbs Up" in her jade green bow, smiles benignantly upon your slumbers.

MODERN WIRELESS TELEGRAPHY AND TELEPHONY.

BY F. ADDEY, B.Sc., M.I.E.E., FELLOW I.R.E.

(*Continued from p.* 99).

Valve Transmitters.

We have now to consider the method of generating high-frequency oscillations and therefore of producing the radiation of continuous waves by means of the thermionic valve.

A simplified diagram showing how a valve can be used for this purpose is given in Fig. 31.

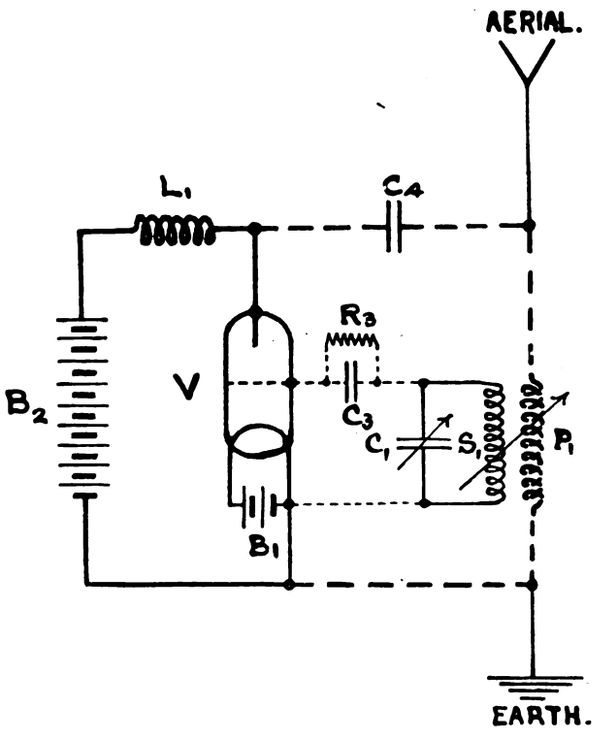

FIG. 31.

The positive pole of the high tension battery B_2 is taken to the anode of the valve V through an inductance coil L_1. The negative pole of B_2 is taken to the filament of the valve.

The condenser C_4 and the coil P_1 are joined between the anode and filament of the valve, and therefore offer an alternative

Digitized by Google

path between these points for the current from the battery B_2 to that through the valve itself. The condenser C_4 stops the flow of direct current through this alternative path and so prevents the battery B_2 from being short-circuited.

The grid of the valve is connected to the filament through the coil S_1, across which is joined the condenser C_1. The coil S_1 forms the secondary of an oscillation transformer, of which the primary is the coil P_1. Between the grid and the coil S_1 the condenser C_3 is interposed. This condenser is shunted by the high resistance R_3. The filament is heated by current from the battery B_1.

The aerial is joined to the end of the coil P_1 which is connected through C_4 to the anode and the other end of this coil is earthed.

The oscillatory circuits, consisting on the one hand of the aerial, the coil P_1 and earth, and on the other hand of the coil S_1 and the condenser C_1, are each tuned to the frequency corresponding to the wave-length which it is desired to transmit.

Suppose now that by some means a slight electrical disturbance is produced in the aerial circuit. If this circuit were detached from the rest of the apparatus the disturbance would die away in a damped train of oscillations of the frequency to which the aerial circuit is tuned. With the apparatus shown in Fig. 31, however, the alternating current pulses in P_1 will induce similarly alternating electro-motive forces in the coil S_1. The coil S_1 and the condenser C_1 form a second oscillatory circuit tuned to the same frequency as the aerial circuit. Consequently the impulses set up in S_1 by the oscillations in P_1 will set this second circuit into oscillation.

The resulting alternating differences of potential between the plates of the condenser C_1 will be impressed on the grid through the condenser C_3. When the grid receives a negative pulse the current flowing through the valve from the anode to the filament is reduced, while when the grid receives a positive pulse the anode current is increased. This current reaches the valve through the inductance coil L_1, and, in accordance with the usual effect produced when a current flowing through an inductance coil is varied in strength, electro-motive forces are set up in this coil in such directions that they oppose the changes of current by which they are produced. If the current be reduced a forward electro-motive force is set up, while if the current be increased the induced electro-motive force is in the reverse direction.

Thus when oscillations are set up in the aerial the potential of the anode of the valve alternately rises and falls above and below its normal value, and these changes in potential take place in step with the aerial oscillations.

The variations in the potential of the anode cause currents to flow round the path through C_4 and P_1, first in one direction and then in the other. By suitably arranging the connexions of the various pieces of apparatus the currents set up in this manner in the coil P_1 can be made to assist the oscillations already existing in the aerial circuit. Consequently the currents in P_1 are strengthened. These increased currents produce a larger effect on the circuit C_1 S_1, which in its turn causes increased changes of potential to be impressed on the grid and these again set up increased fluctuations in the potential of the anode of the valve, and so the train of operations is repeated.

Thus the oscillations, once started, continue to increase, the necessary energy being drawn from the high tension battery B_2, until the supply of energy from this source just balances the various losses of energy which occur in the different circuits. When this state of balance is reached the oscillations no longer increase in strength, but are maintained at a steady value.

During the operation described, the plate of the condenser C_3 which is joined to the grid accumulates a negative charge, due to the electrons picked up by the grid, and this charge gradually leaks away through the resistance R_3. The valve is so arranged that the best operating point on the characteristic curve corresponds to some particular *negative* value of grid potential, and the values of C_3 and R_3 are so chosen that the average potential which the grid attains by reason of the accumulation of electrons just mentioned is maintained at this particular negative value.

The long and short emissions of waves to form Morse signals are usually produced by a key which closes or opens the high tension lead to the anode of the valve. This key worked by an electro-magnet, which is in its turn controlled by a hand key.

Signalling may also be carried out by opening and closing the leakage path R_3 round the grid condenser C_3. It has been explained above that R_3 and C_3 are so chosen that when oscillations are taking place the combined effect of the accumulation of negative charge on the grid, and the rate of leakage of this charge through R_3 brings the grid potential to its correct working value. If now R_3 be disconnected the negative charge reaching the grid cannot leak away. It therefore accumulates and the potential of the grid becomes more and more negative. The anode current consequently decreases (see Figs. 13 and 20) until ultimately it is reduced to such a low value that the oscillations stop. When the grid leak is again joined up the oscillations recommence. These actions take place very rapidly, so that by manipulating a key placed in series with R_3 signals can be sent.

In Fig. 31 the high voltage supply to the anode, and the current for heating the filament were, for the purpose of explaining the action of the apparatus, shown as being obtained from batteries. In actual commercial installations an alternating current supply is used for both purposes. By means of a step-up transformer this current is raised in voltage, and by suitable devices the high voltage alternating current so obtained is rectified and the current pulses smoothed out, so that a steady unidirectional supply is obtained for the anode circuit. The current for heating the valve filament is obtained from the same alternating supply, a step-down transformer being used, from the secondary coil of which the filament current is drawn.

The complete arrangement is shown in Fig. 32, in which pieces of apparatus which are also shown in Fig. 31 have been lettered in a similar manner to that diagram.

The alternator A supplies current to the transformer primary P_2 through a controlling impedance coil L_2.

The secondary coil S_2 has its centre point joined to the filament of the transmitting valve V, while its extremities are joined as shown to the anodes of two "rectifying" valves V_1, V_1. These valves are only provided with an anode and filament.

Since the current is carried across a valve by means of the stream of negatively charged electrons shot off from the heated filament, it follows that a current, using the word in its ordinary signification (see page 171, vol. VII), can only be sent from anode to filament. If a reverse voltage be applied to a valve no current will flow.

The filaments of the two rectifying valves are joined together, and are connected through the inductance coil L_1, to the anode of the transmitting valve V.

As the current alternates in the primary coil P_2 each terminal of the secondary coil S_2 becomes first positive and then negative relatively to the centre point of the coil. When the upper terminal is positive the lower terminal is negative, and *vice versa*.

When one terminal of S_2 is positive relatively to the centre point, a current is sent through the corresponding rectifying valve, and through the transmitting valve V back to the centre of S_2.

During the following half period of the alternating current, when the terminal of S_2 which we have just considered is negative, no current can flow through the rectifying valve. The other terminal of S_2 is, however, now positive, and a current will therefore flow

Digitized by Google

through the corresponding rectifying valve. It will be seen that as far as the anode circuit of the transmitting valve is concerned the currents with which it is supplied are always in the direction from anode to filament, no matter which terminal of S_2 is positive.

Thus a series of unidirectional current pulses are sent through the anode circuit of V.

If, however, nothing more were done these unidirectional pulses of anode current, at the frequency of the reversals of the alternating current supply, would set up corresponding groups of high-frequency oscillations in the aerial and the radiated waves would not be uniform.

To get over this difficulty the condenser C_5 is joined between the lead to the anode of the valve V and the return lead from its filament. This condenser smooths out the pulses from the rectifying valves and so the anode current is made steady.

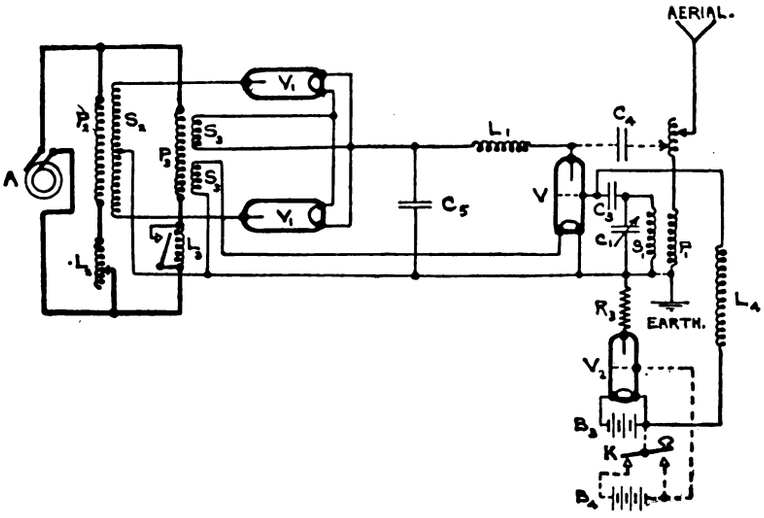

FIG. 32.

The action is similar to that produced by a long length of rubber hose when pulses of water are forced into one end from a pump. Each pulse is partly spent in stretching the rubber, while during the intervals between the pulses the stretched hose contracts and helps to keep the water flowing. Thus the irregularities in the supply are smoothed out, and a steady jet is obtained at the other end of the hose.

The filaments of all the valves are heated by alternating current obtained from another transformer. P_3 is the primary coil of this transformer. There are two secondary coils S_3, S_3; one for the filaments of the rectifying valves, and one for that of the transmitting valve. The filament supplies are separated in this way to keep the transmitting valve filament and the apparatus connected with it away from the high voltage supply to the anode.

The inductance L_3, in series with the primary coil of the filament current transformer, is automatically short-circuited when signals are being sent, and the filament currents are therefore automatically increased. In the intervals between the signals the filament currents fall. This prolongs the life of the valves.

In Fig. 32 is also shown a modification of the method of signalling by opening and closing the leakage path round the grid condenser. Instead of placing a key directly in this path the resistance R_3 (compare Fig. 31) is joined to the anode of a valve V_2. The leakage path is completed by a lead taken from the filament of this valve through the inductance coil L_4 back to the grid of the transmitting valve. A key K and a 200-volt battery B_4 are connected as shown between the filament and grid of V_2. When the key is at rest the battery B_4 is in circuit, with its *negative* terminal connected to the grid. The large negative potential which is thus given to the grid completely stops any current from passing through the valve V_2 from the anode to the filament, and thus no current can flow through the leakage path round the condenser C_3. The oscillations are accordingly stopped. It will be observed that the anode of V_2 is joined to the positively charged plate of C_3, while the negatively charged plate is connected to the filament, so that the voltage in the leakage path is applied to the valve V_2 in the proper direction for a current to flow if it were not prevented by the high negative grid potential.

When the key K is depressed the grid of V_2 is joined directly to the filament. The potential of the grid is therefore raised to that of the negative end of the filament, and a current can now flow across the valve from the anode. The accumulated charge in C_3 therefore leaks away, and the oscillations take place, as already explained.

The inductance coil L_4, placed in the leakage path, is to prevent high-frequency oscillations passing along the leak from the grid.

By the arrangement just described only a weak current has to be broken with the hand key to control the power actually used for signalling.

(To be continued.)

TELEGRAPHIC MEMORABILIA.

WE are an insular people geographically and are frequently particularly so in outlook and mentality. Telegraphy, though world-wide in its ramifications and interests, though linking up continents and islands and bridging over huge spaces of the ether, and despite its appeal to wide view and wide interests, strange to say, does not always associate itself with that thought which studies questions from continental points of vantage or international interests. To some the existence of an International Telegraph Convention is a bane, whereas its inception was born of a real desire to unify the treatment of telegrams throughout the world. Nearly every country whose representative signed the various conventions has built up its own local system on the same or a similar basis so that it might dove-tail itself into the international system. Here in these islands we have developed telegraphy and especially the treatment of telegrams, on our own lines, probably expressing the Anglo-Saxon independence of thought and action. With that one has no right to quarrel. When, however, it comes to a desire to model European and International telegraphy upon British or American models one must expect some slight protest on the part of the representatives of at least a few of the other odd nations and states spread over this globe.

If some of our methods, or *all* of our methods appear to our conceit to be preferable to those adopted at periodical international gatherings of telegraph experts assembled from all parts of the earth, from China to Peru, these quinquennial sessions surely provide the opportunity for vocal expression of the faith that is in us. Once, however, having placed our nation's signature to the considered majority opinion there is nothing more to do than to settle down to the agreed-upon regulations and to faithfully adhere thereto. Provision is made in the existing convention for any variation in treatment upon which any two of the high-contracting parties may agree between themselves and this has been utilised from time to time between two contiguous nations. When criticism against certain procedure laid down by the International Telegraph Convention is made, may it not be that the root cause of the difficulties lies, not with the international system so much as with our own English system. One has heard of complaints against the identification of telegrams by numbering them, for example because we on our island prefer code time. One hears criticisms on the exactitude necessary regarding non-deliveries; or the handing-in time (whether a.m. or p.m.) or of the insertion of the date, and also the obligation for exactness as regards the number of words in Press telegrams hundreds of words in length, &c., &c. It is, however, international practice and the criticism savours very much of that of the dear old lady, who, watching her boy's regiment march past, remarked that "only my Jock was in step."

The matter of international *accounts* never seems to strike those not in daily touch with international telegraphs, and it has come to my ears that certain of our friends across St. George's Channel, who, with their new status, have been brought face to face with the financial side of international telegraphy have expressed unfeigned surprise at the international obligations which direct contact with the continental powers involve.

Mr. S. Evershed at the Jubilee Conference of the I.E.E. made the following sage observation on the evolution of telegraphy including what at first sight may almost appear to be the reversion to type portion of the cycle.

"Telegraphy began with a wireless telegraph (an optical system). Yet, the optical system was essentially an electric telegraph working on a wave-

Digitized by Google

length of about one forty-thousandth part of an inch, and using the human eye as the receiver. Then came the electric telegraph with wires to act as guides, and now we are using a wireless telegraph once more with a somewhat longer wave-length!"

So the myth that the mysterious fires which occurred in the U.S. were due to the powerful wireless telegraph and telephone installations was soon exploded although very gravely explained by "a well-known scientific lecturer."

According to a statement issued by the Postmaster-General, the total expenditure to March 31, 1921, on the Tube railway which is being constructed for the conveyance of parcels and mails to and from the G.P.O. was £1,057,823, of which £185,775 was spent in the financial year ended at the date named. Tunnelling accounts for £767,710, and the other leading items are £73,103 for stations and £72,116 for earthworks, &c. The Ministry of Transport has extended the time for the completion of this railway until August 1923.

The *Sydney Morning Herald* states that the duplication of the telephone trunk line between Sydney and Melbourne has been completed. A duplex telegraph circuit has been superimposed upon each of the circuit wires. The length of the new cable is 580 miles, and it has cost about £36,000.

It has also been agreed between the Governments of France and Italy to open up a new telephone line between the two countries by linking the Susa office with that of Modana and making use of the existing connexion between Tunel del Frejus and Modana.

That the idea of ultimately succeeding in perfecting a system of photographic telegraphy has not been abandoned, may be gathered from the two following items from the Patent Office. The patents granted to Dr. Curt Stille No. 12,709 of 1912, and 9,061 of 1913 respectively, for "Improvements in telegraphic photography," and "Improvements in optical receivers for facsimile telegraphs," have been restored.

Before long, according to the *South Western Railway Magazine*, only nine long-distance telegraph circuits will remain between Waterloo Station, London, and certain stations below Woking and Guildford, as with these exceptions the whole of this company's telegraph circuits will be converted into telephones.

According to advices from Sydney the government has introduced the Murray multiplex system, combined with Baudot printers for telegraphic communication between Sydney and Melbourne.

Mr. J. Joseph in his paper on "Some Practical Applications of the Thermionic Valve," read before the I.E.E., accentuated the fact that the use of the thermionic valve in long-distance trunk telephony had reduced the weight of the necessary cable conductors from 200 to 600 lbs. per mile to as low as 20 lbs. per mile. Valves were placed at distances of every 30 miles. Incidentally the speaker made the gratifying statement that the best valves were being produced in this country. One of the latest applications of the valve was that of reproducing the sounds of heart-beats so that they could be heard in a large room.

By agreement with the Government the Amalgamated Wireless (Australasia), Ltd., of Sydney, is authorised to establish and conduct direct wireless communication between the Commonwealth and England, and also to take over and develop the entire Commonwealth Wireless Services. The Commonwealth will take the majority of the shares in the Australian Co. when its capital is shortly increased.

What must be an unique career for a Post Office telegraphist is that of Mr. R. E. Harwood, C.V.O., C.B.E., formerly of the Central Telegraph Office, who has recently been appointed as Temporary Deputy Treasurer to His Majesty the King.

As was most fitting a permanent wireless telegraph aerial has recently been installed on the building of the Institute of Electrical Engineers, Victoria Embankment, London.

Wireless telephone broadcasting in the United States has reached so acute a stage that President Harding recently asked Mr. Hoover to call a conference of Army, Navy, and commercial experts on wireless telephony with a view to the restriction of its use. It appears that the American ether is so fully charged with advertising stunts, &c., as to endanger the use of wireless for purposes of national defence.

Mr. Hoover has very decided opinions on the subject. At the opening of the committee's proceedings, he said:—

> "The use of the radio-telephone for communication between single individuals, as in the case of the ordinary telephone, is perfectly hopeless. Obviously if 10,000,000 telephone subscribers were crying through the air for their mates they would never make a junction; the ether would be filled with frantic chaos and no communication of any kind would be possible.
>
> The wireless telephone had one definite field—in the spread of certain predetermined material of public interest from central stations. This material must be limited to news, to education, to entertainment, and the communication of such commercial matters as were of importance to large parts of the community at the same time. Wireless telephony was, therefore, primarily a question of broadcasting, and it became of primary public interest to say who was to do the broadcasting, in what circumstances it was to be done, and with what material. It was inconceivable that a service so important for news, for education, for entertainment, and for vital commercial purposes should be drowned by advertising chatter, or be used for commercial purposes that could be quite well served by other means of communication."

It is a great pleasure to place on record the appreciative letter which was recently received from two officials of the Dutch Administration who a few weeks ago spent several days in the C.T.O. London studying the organisation of that huge office. The size of the building and the thousands employed therein astonished the delegates. We must congratulate the two representatives upon the assiduous manner in which they conducted their studies and the keenness with which they followed every detail.

It is to be regretted that Germany should have found herself unable to fall in with the idea of adopting "summer-time," as have France, Belgium, Holland, &c. To the outsider it might appear that the goal of Universal Time has been reached as actually Berlin and London clocks now synchronise, but the incidence of London's traffic and that of Berlin do *not* stand in their G.M.T. and M.E.T. relationship for which staffing on this side is "keyed." There's the rub, but I wonder whether I have made myself understood?

It was interesting to read the lengthy and detailed accounts in our daily papers of the elaborate arrangements made to provide for the telegraphic and telephonic communications at Genoa. "New telegraph wires have been laid to London, Paris, Brussels, &c.," said *The Times* on March 27. Here in London we did not recognise the newness! After the first two or three days the Service settled down very fairly and knowing the difficulties with which our French and Italian colleagues had to cope the wonder is that the results were so good. The route *via* Germany in which Siemens apparatus was utilised at Genoa, Berlin and London proved very useful and was ready at a time when most needed.

Reperforated slip at Berlin gave practically one uninterrupted transmission from Genoa *via* Switzerland, Germany and the North Sea to London.

The death of Mr. A. L. Steel, late Chief Superintendent at T.S., is announced. The deceased who was a pre-transfer telegraph clerk commenced his career in the old Electric Telegraph Company in 1867, and for many years was attached to the Stock Exchange office. Coming to T.S. he was promoted in 1905 and became Night Superintendent and later was made Chief Superintendent, which appointment he declined in view of it adversely affecting his superannuation pay. He had a remarkable penchant for a vociferous vocabulary, and on one memorable occasion it brought him into conflict with a well-known subordinate officer who rebelled against his chief's continued insistence in mutilating the King's English. Mr. Steel retired November 1912 upon reaching the age limit.

Yet another "passing" has also added to the depletion of the ranks of our retired colleagues in the death of Miss G. S. Lynch, late Chief Supervisor of the female staff of the C.T.O., which took place at Brighton. The deceased lady had for some time past apparently been in failing health and at the end of last year went to Brighton to recuperate, but unfortunately on medical advice was compelled to go into the Sussex County Hospital, where she died on Monday, Feb. 20, after much suffering. "Georgie" Lynch, as she was so popularly known, entered the Service previous to the transfer, through the old Electric Telegraph Company, and came to T.S. in 1870, and on the retirement of Miss Dowdey became the Chief Lady Superintendent in 1911, and retired four years later on attaining the age limit. As showing the affectionate regard in which she was long held throughout her official career, we cannot do better than append the following appreciative lines written by one of her old office friends.

"The passing away of our dear old friend and colleague, 'Georgie Lynch,' has caused many hearts to grieve at the thought, that no more would she be present amongst the T.S. friends where she was such a welcome addition, and a few words from one who knew her well, will perhaps voice the sentiments of many concerning her.

From her earliest entry in the Service, to the end of her working days, 'Georgie' was known as a faithful, devoted spirit, in the discharge of daily duties, and to have worked with her, was to gain a clear knowledge of one's own limitations, in the view of her superior business qualities, which were second to none.

Keen in observation, prompt in dealing with difficult questions, and able to rule so as to compel obedience, without hardness, she was a splendid type of a keen business woman, who was always available for guidance to those who were not so gifted as herself, but above the business view of her character, there was the loving personality which pervaded all her actions and intercourse with others.

That sympathetic, tactful way in dealing with the life around her endeared her to all. It was an atmosphere created by herself, and it was always present.

No one ever went to 'Georgie' with a trouble, or a difficulty, but had a firm conviction that she would understand, and help them.

It was that wonderful spirit of love and sympathy, that was so attractive, and drew to herself the love and loyalty of others."

THE LATE MR. V. H. STEPHENS.

THE initials "V.H.S.," so familiar to the telephone staff throughout the country will appear no more on official papers, for, on March 31 a group of the relations and friends of Vivian H. Stephens stood at his graveside; and among these mourners were four who came from their retirement to pay a last tribute of affection to the colleague of bygone days.

An untimely call of Death, in that Mr. Stephens already stood on the threshold of the retiring age, and, with the vigour and apparent health of a much younger man had every reason to look forward, a few months hence, to a new period of life in the leisurely enjoyment of many activities, and to the certainty of a ready welcome in many a domestic circle.

His was a full existence, the expression of an upright character, a broad, kindly and sympathetic nature, and a receptive mind stored to overflowing: yet modest and unassuming withal, eager to please and pleasing unconsciously. He had many acquirements: a student of history of all times, of all countries and of all phases, his knowledge of languages was merely a means to an end, but he was as familiar with French, German, Russian, Italian and Spanish as with Latin and Greek. And these attainments were not without practical utility, for, 23 years ago, he translated into English a Russian work by Professor Kasansky on the "History of the Universal Telegraph Union," a task undertaken—as many such tasks are undertaken by servants of the State—*con amore*; unknown to any but to Chiefs and immediate colleagues.

Unknown, also, telephone subscribers of this country have lost a friend. It was in 1913 that Mr. Stephens left the comparative placidity of the Home Mails Branch of the Secretary's Office for the troublous region of Telephones—and at the most difficult of all the difficult periods of this long-suffering service. But to him it meant but a new and interesting study, the grammar of which must first be mastered; and volumes of instructions and regulations were as text books of a new subject to be understood and assimilated. So, he "crammed" at home, and soon became an authority; and, in regard to his special duty—the treatment of subscribers' complaints—was perhaps without a rival. Sympathetic, tactful and courteous, an interview with a member of the public usually meant a convert gained, and he who came to abuse, went away mollified if not convinced. Only to-day, the representative of an important firm called upon me, and remarked in the course of the interview, "Perhaps if I could see Mr. Stephens——" "My dear sir," I replied, "I wish you could."

Of all the friends he has left behind, none regret his loss more than the staff of our Branch. Helpful to, and untiringly patient, he was especially encouraging to the juniors, and it was no doubt his own sensitiveness that impelled him to deal generously and forbearingly with the faults or shortcomings of the immature or inefficient.

Mr. Stephens sought the company of all sorts and conditions of men. Denied in his latter years the felicity of a settled home, he found some compensation in cosmopolitan society; in the exchange of ideas, political, philosophical and literary, with men of various races and varied outlook. But he was equally at home with the poorly endowed and unattractive; ready even to learn from them; for in the East End of London there was a Mission for which he did much good and kindly work, striving to illumine for a season the monotony of dreary lives by the practical application of a comprehensive and sympathetic personality; and he had many a tale to tell of the grim humour and groping intelligence of the submerged struggling mind.

Perhaps, however, it was among the young of intimate acquaintance that he found his chief source of enjoyment. Without children of his own, it was part of his nature to draw to himself the attachment and affection of those of others who came within his circle; and the study of that elusive and puzzling problem, the Modern Boy, had for him a perpetual fascination. He took him seriously, but not heavily; and nothing delighted him more than argumentative encounters with the species, in which he could find exercise not only for good-natured banter—which, with a chuckle, he could take as well as give—but for his own lively intellect.

Among other things Mr. Stephens was a tasteful draughtsman and colourist, and I have seen some beautiful specimens of his handiwork in the style of ancient monkish manuscript and decoration. He would delve among the poets of old, and illuminate examples of their work with ornamental border and lettering in gold and blue and red and green. A specimen of his work lies beside me. It is a copy of mediæval verse by the Italian poet, Poliziano, entitled "Vision of Perpetual Spring," and is surmounted by a coloured landscape drawing which might have been the work of a contemporary artist.

Of an old Cornish family, Mr. Stephens was born in 1862 and joined the Post Office in 1884. He was attached successively to the Telegraph, Foreign and Colonial, Home Mails, and Telephone Branches, and the comprehensive number of Post Office staff who desired to be associated with his memorial wreath was a testimony of the regard of those whom he has preceded to the Greater Retirement.

E. H.

FIFTY YEARS OF ELECTRICITY.

PROF. J. A. FLEMING, F.R.S., who has been awarded the Albert Medal of the Royal Society of Arts for 1921 in recognition of his many valuable contributions to electrical science, has conceived the happy idea of recording the progress of electrical engineering since 1870, the year in which he attained his majority. Under the title of "Fifty Years of Electricity—The Memories of an Electrical Engineer," he tells in his own inimitable way a story as absorbing as any yet written on electricity and its applications. "1870,' says Dr. Fleming, "was a year of importance in electrical invention. Prior to that date electrical engineering may be said to have been limited to telegraphy, land and submarine." It will thus be seen that practically every phase of electrical work is covered in Dr. Fleming's book, and with a great deal of this work he has had a close personal connexion.

Not only is the matter interesting, but the style in which it is written is marked by a simplicity and clarity of expression, and a freedom from unexplained technical terms, which might well be a model for any writer on popular science.—(Crown 4to., published by the Wireless Press, Ltd.)

THE BAUDOT—XXXII.

BY J. J. T.

THE ratchet wheel G of the impulse cylinder $l^{I}l^{II}$ (Figs. LV, LVI, Vol. VII, p. 73) shown, Fig. LXVIII in greater detail, though but a small piece of the Baudot receiver demands some attention. The steel drum l^{I} should fit very easily on the sleeve l of the impression arm, which should be kept free from paper dust and should be well lubricated. The washer s should not be so screwed as to bind the drum l^{I} too tightly upon the sleeve l and thus impede the action of l^{I} and l^{II}. The adjustments of the two clicks K (the movement click) and K^{I} (the retaining click) and their respective springs K^{II} and K^{III} should be such that when *the retaining click and spring* K^{I} K^{III} *are brought to rest the click should be well home in the cog while its spring should be adjusted to only a moderate pressure.* The upper and *movement* click K should *at the same time* come to rest about the middle of a tooth, as shown, while, in this case the relative spring K^{II} should be given *considerable* tension.

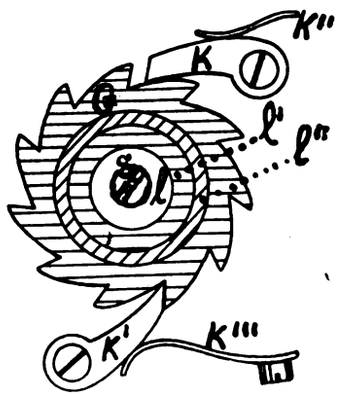

FIG. LXXVIII.

The faults which would result from mal-adjustments are as follows:—If the distance between the extremity of K and the succeeding tooth were too small, upon the return of the arm to its horizontal position the click K would *not* fall into the next slot. As a result there would be no pull on the paper slip, blurred printing of the first part of a letter, and irregular forward movement of the paper ribbon itself.

If on the other hand the distance between the end of K and the succeeding tooth were too great, a large portion of the movement of the impression arm would be lost, the paper becoming crumpled and the letters jumbled together.

The *Compression Cylinder* (Fig. LV, Z.).—Sufficient tension should be given by means of the spring R. Should the tension be too weak, when the impression arm returned to its position of rest, the paper band would not be sufficiently gripped, would not advance smoothly, and the impression would be faulty. If the tension were too great, the movement of the impression arm and its cylinders would be considerably hindered and probably the arm itself might not always engage with its retaining click. It could also happen from the same cause that the teeth of the impulse cylinder G would cut into the paper band and cause it to fold up, clogging the entire movement.

Be careful from time to time to see that the axle of this cylinder is perfectly horizontal and that there is no play caused by wear and tear. Such a defect will result in an irregular wavy movement of the paper and therefore of the letters printed.

(To be continued.)

REVIEWS.

"Electrical Engineering Testing." By G. D. Aspinall Parr. M.Sc., M.I.E.E., A.C.G.I. (Chapman & Hall). Price

The fourth edition of the above-named work is now available. It is included in the D.U. (Directly Useful) Technical Series. The claim made for this series is that the books occupy a midway position between the purely theoretical and the ultra practical. The author's treatise on "Practical Electrical Testing in Physics and Electrical Engineering," was written for first and second year students, and describes 120 tests, most of which are included in the curriculum of all up-to-date electrical training institutions.

In *Electrical Engineering Testing* 159 tests are described which deal principally with heavy electrical machinery. Many of the tests, of course, form part of the normal laboratory instruction.

Amongst others the series includes the calibration of measuring instruments, photometric tests, localisation of faults in power mains, efficiency of dynamos and the measurement of the electrostatic capacity of concentric and other cables. Each test comprises —an *Introduction* giving the chief features, advantages, and disadvantages of the test; the *Apparatus* necessary; the *Observations* to be carried out, and, of course, a diagram of connexions. Only the formula necessary to obtain the desired result is given with the description of each test, and the derivation and solution of the formulae are given in an appendix. The last 160 pages contain illustrations and descriptions of testing apparatus referred to in the first part of the book and some useful tables. It is doubtful whether there is justification for the presence of the first chapter which explains the process of curve plotting, in a work of this description. A knowledge of the theory of electricity and magnetism is assumed, and it is reasonable to suppose in these days that the art of curve plotting has also been mastered before the student arrives at the stage of carrying out practical electrical testing. A short chapter is given up to an explanation of methods adopted in jointing electric light wires, cables and mains which at first thought may seem proper to a Wireman's manual, yet its presence is no doubt justified when the fact is borne in mind that many of the tests involve the jointing of wires and cables. The book is confidently recommended for the use of students and as a work of reference for all electrical engineers.

G.

ANSWERS TO CORRESPONDENTS.

J. F. S.—The treatment of telegrams for abroad received from the Irish Free State over the Anglo-Irish cables are now dealt with for account purposes in much the same manner as those received from the Continent. An accurate abstract is kept at the circuit detailing the exact number of words and all particulars necessary for account purposes.

Amateur.—Yes. President Harding is also a wireless enthusiast, and actually possesses a private receiving installation. It is said this installation is capable of hearing Hawaii and Panama, which transmit, not vocally, but by the Morse code.

Financier.—The cause of the delay in the making up of the Eastern Telegraph Company's accounts for 1921 is simply the great difficulty of obtaining the necessary returns from foreign administrations who have not yet caught up with arrears due to the war.

CHESS.

MR. BORIS KOSTICH, the Serbian chess master, gave a simultaneous display at the G.P.O. North Refreshment Club, London, on April 10, 1922, when he played 28 members of the G.P.O. North and G.P.O. Engineering Chess Clubs. He won 22 games, drew 5 and lost 1. Mr. J. Y. BELL was the successful player, whilst Messrs. S. C. Bartholomew, J. E. Pollitt, P. C. Dhonau, D. Southcott, and J. Webb secured draws. Play commenced at 6 p.m. and finished about 10 p.m. About 40 spectators being present. Mr. Kostich was cheered at the finish.

The
Telegraph and Telephone Journal.

PUBLISHED MONTHLY IN THE INTERESTS OF THE TELEGRAPH AND TELEPHONE SERVICE, UNDER THE PATRONAGE OF THE POSTMASTER-GENERAL.

Editing and Organising Committee - - - J. STUART JONES. JOHN LEE. J. J. TYRRELL. W. A. VALENTINE. J. W. WISSENDEN.

Managing Editor - - W. H. GUNSTON.

NOTICES.

As the object of the JOURNAL is the interchange of information on all subjects affecting the Telegraph and Telephone Service, the Managing Editor will be glad to consider contributions, and all communications together with photographs, diagrams, or other illustrations, should be addressed to him at G.P.O. North, London, E.C.1. The Managing Editor will not be responsible for any manuscripts which he finds himself unable to use, but he will take the utmost care to return such manuscripts as promptly as possible. Photographs illustrating accepted articles will be returned if desired.

VOL. VIII. MAY, 1922. No. 86.

FRIVOLOUS CALLS.

"SEVERAL business men," we learn from that instructive historian of the manners and customs of the moment—the Press, "are shocked by the number of conversations between office girls and their men friends." Under the indulgent conditions of the flat rate these conversations were indistinguishably merged in the prosaic body of general business traffic, but now when charges for calls are questioned and scrutinies result, the tender secrets of the telephone are threatened with diversion to some slower channel. "This will at least serve to check flirtations in office hours" was, we are told, the comment of a man who employs a large number of girls. Perhaps he is too sanguine, and perhaps business men are easily shocked, but certainly the abolition of the flat rate raises a question of ethics in respect of private calls. Hitherto they have only involved a presumptive loss of the employer's time now his pence also are lost. Hitherto the frivolous call was made at the cost of the Administration; now it is made at the cost of the employer. Hence these tears.

> For loss of time
> Although it grieved him sore,
> Yet loss of pence full well he knew
> Would trouble him much more.

It is probable that a clerk of average integrity had small scruple in indulging in private telephone conversations during the slack moments which sometimes occur even in the busiest offices. His employer paid for unlimited service and his clerk's personal messages cost him no additional expense. The young lady thirsting for daily soul-communion with the beloved could sacrifice part of her luncheon-hour to the friendly telephone and not even rob her employer of five minutes of his time. Now all this is changed. To offer to pay would be to confess too much to unsympathetic ears; to continue the use of the telephone without paying would be to saddle the firm with numerous three-halfpences, the fruitful cause of bitter and insoluble disputes with the Administration later on. The third course is self-abnegation.

> Thou shalt refrain! Thou shalt refrain!
> This is the everlasting song
> Which ceaselessly our life-time long
> Each hour in passing hoarsely sings.

Whether flirtation in office hours is checked will be a gauge of the measure of her probity or of her willingness to pay.

But the whole question is precisely one which the advocates of the message rate took specially into account. The frivolous call—by which we mean that which is idly made because the telephone is at hand, and because it will cost nothing—has been an incalculable impediment to good service in the past and the cause of unnecessarily overloaded lines and engaged signals, for the mere fact of the callers having nothing of importance to communicate often results in the call degenerating into an interminable chat. We should not for a moment argue that the telephone service is not for the transmission of social messages equally with commercial and political calls. The telephone is as invaluable for fixing or altering appointments, for booking seats and so forth, as for commercial deals.

A rough criterion which distinguishes a frivolous from a legitimate social call is whether it is worth paying for. This distinction the message rate provides for. If the society lady or the girl clerk wishes to make an appointment or convey an invitation to a gentleman, she has to pay for the call; that is all.

HIC ET UBIQUE.

Electricity contains an interesting account of the substitution of telephones for single needle telegraph working on a large portion of the London & South-Western Railway. Switchboards exist at Waterloo (200 line manual and 50 automatic), Nine Elms (100 lines), Clapham Junction (50 lines), Feltham (100 lines), and at Woking, Basingstoke, Eastleigh and Southampton. Every station on the system between these points is or will be connected with one or other of these switchboards. In addition, Staines, Ascot, Windsor and Reading are served from Feltham, and Aldershot, Guildford, Farnham, &c., from Woking. Each branch line has several stations on it, which are called by means of code ringing, but at the large stations the various offices are connected directly with the exchange. When the scheme of substitution is completed only 9 long-distance circuits will remain at Waterloo, and any telegrams for stations below Guildford and Woking for stations above will be telegraphed to Waterloo and transmitted thence by telephone to the stations for which they are intended.

THE underground cable between Berlin and Cologne, according to the *Manchester Guardian*, has now been completed. Construction was begun in 1912 and by 1916 the cable had reached Hanover (*via* Magdeburg and Brunswick), and at the end of last year it was extended to Minden, Dortmund, Düsseldorf and Cologne. It weighs 12,000 tons, the coppers parts 3,600 tons and the lead casing 7,500 tons. It contains a total length of wires of 117,000 km.

The results obtained have surpassed all hopes of the engineers.

Digitized by Google

IN the meantime, the London to Manchester underground telephone cable, is now nearly ready for working, and will greatly improve telephone communication between London and the North. The ducts in which the cable is laid were finished in July, 1920, and the cable itself, which is 183 miles long, and contains 160 pairs of wires, was drawn in April, 1921, so that in all the work has occupied the best part of two years. The cable is the first trunk cable to be equipped with telephone repeaters, and on that account it has been possible to reduce the weight of the copper conductors to 40lb. per mile. In previous similar cables, such as that between London and Liverpool, it was necessary to have conductors as heavy as 300lb. per mile, and a great saving of copper has, therefore, now been effected.

Spur cables to Liverpool, Leeds, Birmingham, Sheffield, Nottingham and Leicester will be connected. Construction of the cable to Bristol and South Wales is also well advanced, and the new cables to the South Coast are nearing completion.

COMMENTING on the Prime Minister's telephone connexion between Criccieth and Downing Street, the *Manchester Guardian* says that the telephone might have saved Mr. Gladstone (had he had it at his disposal)—

"such desperate expedients as the 'flagging' of an express in order to get rapidly to town to deal with a situation, just as it might have saved Disraeli the rebuke he received from the Hughenden incumbent for travelling on a Sunday. Yet one feels that Disraeli would not have liked the telephone, and it is difficult to imagine Lord Salisbury making use of it.

When we get a little farther back imagination may take a wider sweep. Conceive, for instance, the oaths which would have poured from Melbourne had any mechanical defect interfered with his telephonic communications even with his pupil of Windsor Castle. Conceive a shivering Postmaster-General being 'carpeted' by Palmerston for a similar mishap; or the petulance of Lord John or Wellington addressing it in the third person; or Canning scribbling squibs on its imperfections. Think of the Duke of Newcastle stuttering and weeping at the telephone, or William Pitt struggling with it after the evening bottle of port. But there is one thing which defies even imagination—the majestic spectacle of Chatham telephoning."

The telephone was introduced into this country two years only before the death of Disraeli; but we find it difficult *not* to imagine Lord Salisbury making use of it. He last held office from 1895 to 1902, by which time the use of the telephone was widespread. Perhaps some of our readers in the London Telephone Service can assure us on the point.

UNSOLICITED testimonials as to the excellence of the telephone service occasionally reach the Post Office. The following is an extract from a letter addressed to the Controller:—

"We are perfectly satisfied with the service of all the exchanges in London area and the extreme courtesy and promptness of service of your staff. Even during the very busy hours our calls have never been delayed or interrupted.

We also found that all the charges in your quarterly account were quite correct.

We are writing this, having in view the numerous complaints of the public in the daily press and the abuse of a highly efficient department.

The London Telephone Service is highly efficient, or at least more efficient than similar services on the continent and U.S.A., of which we have a great personal experience. We are perfectly sure that if the general public, and especially our business men, would remember that the operator is a human being and not a machine, that exchange operating is not such a simple thing as it seems to them; that Mr. So-and-So is not the only subscriber in London; and finally, that if a delay occurs it is mostly Mr. So-and-So's own fault, because he does not know how to handle a telephone, there would be less complaints and more endeavours to help the operator."

ONE of the American telephone companies (says the *Daily Sketch* of April 20), the Bell system, is advertising that last year it put in two million new instruments—"equal to the total number of telephones in Great Britain." This makes our Post Office look pretty small.

Now for the facts:—

The Bell system and connecting companies (that is, not "one American company" but nearly ten thousand) increased by 778,284 telephones during 1921.

The statement in the Companies' report is that "The Bell system is adding as many new telephones each year as there are in all France."

SOME ASPECTS OF PUBLICITY IN RELATION TO POST OFFICE WORK.*

BY JOHN LEE (*Controller, Central Telegraph Office*).

THERE once was a washerwoman who indulged in a daily illustrated newspaper before she began her day's work. As she laid it down one sunny morning and tucked up her sleeves to begin her work, she said "Now this would make a real picture for the papers." It may be that she was right. We are all washerwomen. We are all of the opinion that our work should appear in the illustrated papers. It may be that publicity is a little one-sided, that it deals too much with certain aspects of life and that other aspects of life go unnoticed, and that certain persons are overlooked. I confess I sympathise with the oldest inhabitant of Criccieth, a small town in North Wales, who said that he had planted three times as many potatoes as the Prime Minister, that the cinema men took no notice of him but gave all their attention to the Prime Minister, in spite of his meagre potato planting. It has been said that the newspapers take the place of parish gossip and that they are far more reliable. Yet parish gossip goes on gaily. You are told that regiments of Russians pass through the country, that everyone except yourself is in receipt of an unemployment dole, that this exalted person drinks heavily and that there are bishops who play cards. The war altered a good many things but it did not change the human passion for subterranean publicity. It revealed to us the possibility of calling a kettle black, until all that one could remember about a kettle was that it was black. It revealed the infection of what is called public opinion, the dear old theory of the scapegoat, which goes back to the Israelites in the wilderness, the object upon whose shoulders human disapprobation is laid. We in the public services have some experiences of being the scapegoat. The public must have material for disapprobation, and what better than an inarticulate body? Reputation was described by Shakespeare as a bubble, a bubble which was sought "in the cannon's mouth." To-day it is sought in less perilous ways; it is made and disseminated. The time may arise when a flashing sky-sign in Piccadilly Circus will be the true criterion of greatness. The Keats of the future will be honoured by this disturbing means; Chattertons who die in garrets will be heralded in blue and red lamps outside garrets. Our tastes and our opinions, our adulations and our estimates of value will be made for us.

This newer publicity calls for examination before we come to examine the work of our own service in regard to it. There seem to be five stages, and we can deal with them conveniently in the historic order. First there is the simple announcement. In a Cotswold village to this day there is a notice "John Smith mends boots." John is quite modest about it, he tells the plain indicative fact. He makes no comparisons. He says that he mends boots—he just improves them. He does not say that he makes them better than they were when they were new. He does not say that his repairs are better than those attempted by his rivals. He does not imitate the notice which I see daily in Cheapside "the best boots in London." How does this rival of John Smith know that his are the best boots in London? Why does not someone trouble to point out to him the exuberance of his claim? The answer is easy. No one believes it. When John Smith says that he mends boots, everyone in the village knows he is telling the truth. Even the vicar would certify, it. But if he said that his mended boots were the best in the Cotswolds, people would shrug their shoulders and say that they have heard that kind of thing before. In fact the simple announcement is not so simple as it looks. It may be very complex. It may be so complex that it defeats its own end. "No man," says an advertisement, "can be well-dressed unless he wears an Aristides collar." That is what is technically called an "effective" sentence. It may make us all sigh to wear an Aristides collar. It may make us feel antiquated in a collar which is not an Aristides collar. But even so we do not believe the statement that none can be well-dressed without it. We are quite sure that there are elegant young men in Bond Street who have never heard of the Aristides collar. Turn from this to the most modest of all advertisements, the public-house sign. It is the original sky-sign. It uses a picture to tell the story—a red dragon, or a black horse, or a hen and chickens. It is mere publicity, mere telling the world. Now this mere publicity is often regarded by those who purvey it as being a conferred favour. When Mr. Cochrane protested against what he called the prejudice of the newspapers against his productions, he was told that he "should not deny the value of publicity," or even of animated discussion, even if the animation verged on anger. Just so the boy with a fly on a pin might say, "I know it hurts, but look at the publicity I am giving you"! The public-house sign made no claim for the superiority of its comforts, that is, it trusted to the comforts themselves to make the claim. It said, in some cases, that it offered refreshment for man and beast, and there is little flattery in the terms "man and beast." The true method of publicity to-day would venture to offer concert-dinners to lords and ladies; the beast is fed with petrol from the Shell pump. Indeed, it is almost true that the day of simple announcement has passed by. Every newspaper is the best morning paper; every gramaphone has the sweetest note; every shaving-soap is the root-spring of America's clean-shaven prosperity; every typewriter is swifter and cleaner and more portable than every other typewriter; every breakfast food is so much better than every

* Paper read before the Telegraph and Telephone Society of London.

Digitized by Google

other breakfast food that the only solution is to take them all and thus to prolong life beyond any power to enjoy it—if breakfast foods permit any enjoyment at all. So there is little room to-day for the simple announcement and we can pass on to the second category.

We come to the assertive announcement. The assertive announcement makes claims. It comes to the fringe of psychology. It impresses the unconscious mind by stamping it with the name of a certain condiment and then in the hour of need you remember that condiment. In time, for instance, you learn that it is an improper thing to say "good morning" unless you have used Pears' Soap. This method of assertive announcement has various grades, but a pretty strong claim for excellence is at the root of all the grades. It adorns the fields as you pass by in the railway train; it makes a dead wall into a living thing, almost a shrieking thing; it uses art and pyschology and the limitations of human nature to its own purpose: it covers the whole realm of human needs. It is not too modest, nor is it too assertive. It appeals to your sense of humour. The drowning man no longer clutches at a straw: he seeks to bestride a tin of meat juice. The beautiful scene in the country or at the sea-side is no longer the benison of heaven to a tired world; it is material for a striped young lady and her camera. The sea-side place which you love is thrice blessed in that a stoutish elderly gentleman (like yourself) who goes there leaps on the sand like (or unlike) a chamois. Poetry comes to its aid. An American railway company is said to have achieved success by inventing a Miss Phoebe Snow, who, clad in spotless white, was able to travel without blemish or tarnish, and the walls and the transparencies on the trams paid their tribute to "Miss Phoebe Snow, who loved to go, on the road to Buffalo: her dress stayed white, from morn to night, on the road of anthracite." It is amazing how much of our lives lies under the influence of the assertive announcement. In the Cotswold village, which I have mentioned, you did not approach John Smith until you really needed your boots mending, and you did not visit the Red Dragon aforesaid unless you had some need of refreshment for man or beast or bicycle. I travel home by the Brighton railway and I find it impossible to sleep at nights except in the striped red and white pyjamas to which my daily journey has accustomed me. We have lost much liberty of thought and action while this progress of assertive announcement has been in development. I am writing this paper with a very beautiful fountain pen, which was given to me by a dear friend, but if I examine my sub-conscious mind, I am even more proud of the fact that every Christian and civilised nation in the world knows it to be the Ideal pen. Your underclothing keeps you warmer if it is the fabric the name of which has soaked into your mind—and underclothing which reaches the mind is real underclothing. "Success in business," says an American advertiser, "can be assured by wearing the Bronx hat; it impresses; it carries weight; it adds dignity to your stature." I suppose one never takes off such a virtue-inspiring hat. There has been a shopping week at Richmond, accompanied by the usual psychological devices. I understand that a local trader offered house-pails and washing boards (I am not sure that I know what they are) at sixpence each. A queue lined up at six a.m. of people anxious to become possessed of a house-pail and a washing board. Either there was an astonishing lack, in Richmond, of house-pails and washing boards or the advertisements succeeded in infecting the people's minds with the idea that house-pails and washing boards were essentials to reasonable existence. So we are enslaved—heads and bodies and minds and souls. Sometimes there are perplexities. Sometimes the assertive announcements do not agree. There is a limit to the number of tooth-pastes which one can use, and to the number of positions at £5,000 per annum, which are available to those of us who take the correspondence courses at certain colleges. But that does not seem to affect the argument. We seem to be fashioned "hollow," as the American poet might have said, "o' purpose that we might advertisements swallow."

That leads me to the next category, the publicity which tells us not merely that our needs can be supplied, but what our needs ought to be. *Facile princeps* in this class is our dear old friend the patent medicine advertisement. It was the pioneer of psychological treatment of announcement. It gave the symptoms of the complaint so cunningly that it suggested all manner of things to our minds. M. Coué has made this into his theory of auto-suggestion. Do you awake with a tired feeling in the morning or have you some sense of fullness after meals, or have you a dislike for certain articles of food, or have you lost nerve and activity? Of course you have. So have we all. There is a multitude of pills and salves and ointments and concoctions for these very common ills of humanity. The law had to step in; *Truth* had to analyse the contents, yet this method of cunning suggestion is still in full fling, but it has gone far beyond the backache and the tired feeling It covers the whole of life and has put the human stomach into its normal insignificance. There is a certain type of shop to which I am invariably allured. It sells all sorts of clothes hooks, screws, popular music, soaps, and the like, various things which, I believe, are called utensils. I confess I cannot pass one without entering and purchasing things merely for the sake of purchasing them—purchasing at the stimulus of subconscious instinct which tells me that I don't want the things, that I hate the thought of carrying them home, but that they are cheap and that I must buy them. I am an economic toper in such a shop, and my family lead me past the doors much as other topers are led past other doors. There are other similar appeals which tell you what to read. They make the *Encyclopaedia Britannica* one's hourly need. They show you that certain cigarettes are essential to happy marriages, that household work (which *is* a necessity) may become merely a pleasant leisure hobby, that your feet were made for somebody's excellent polish, that the cares that irk us only come in the absence of chocolate, that rain descends from Heaven equally on the just and the unjust, merely to enable both to wear a certain mackintosh. In fact, the process is inverted. Instead of existing to supply our needs the advertiser shows us that we exist merely to consume his goods. We travel to fill his hotels; we walk to use his boots; we dress to wear the clothes which he provides; we can exist with ordinary food and ordinary raiment, but if we are to rise to the heights of really worthy life, he shows us what our essential needs should be. We are uncomfortable until we acquiesce. "Anything," we say, "for a peaceful life." And so our civilisation grows, our needs grow and the psychology of advertisement accelerates and expands the needs and directs them into the appropriate channels.

Then we pass to the fourth category. It is even more subtle. It is the psychology of the formation of a public sentiment. It begins with the use of opprobrious labels. It proceeds by the suggestion that the label—which is only a label after all—is the result of a careful and minute study. The public mind becomes infected. Just as it has learned not to be able to breakfast without Farmer's Golden Oats, so it has learned that in every walk in life there is the sum of efficiency except in the public service. People forget that trains are late. They will strap-hang in a crowded bus and comfort themselves by the suggestion that there is inefficiency in Whitehall. There are various aspects of this infection. It may suggest that certain things should be fashionable. Thus it may hint to us that we do not eat enough brown bread or peas. That may be quite true, but we would rather that the suggestion were made by persons not quite so definitely interested. It may send a wave of feeling over the country in favour of white waistcoats. It may and does attempt even bolder ventures, and there are reasons to believe that even high politics has not always scorned these psychological methods. It is a new aspect of publicity, and a disconcerting aspect, and I am not surprised to be told that the next General Election may be a psychological conflict. All the machinery of "atmospheres," "complexes," "suggestions," will be used. Voters are to be put under the influence at public meetings by means of cartoons, and the like. In fact, it is an odd irony, but the wide increase of the franchise in recent years seems to lend itself to this method, and all sorts of societies and propaganda are prepared to use it. Women are led to tremble at all sorts of impending dangers; men are led to suppose that in this or in that eventuality there will be something horrible. What it is may not be suggested, for the days have gone by for the careful study of detail. Sometimes it may seem that this method defeats its own ends. We become suspicious. We read between the lines and at the back of the lines. We grow to the belief that after all the moon must be made of some green cheese because the fact has been so strenuously denied. It cannot be for the public good that newspaper statements should thus succumb to the analysis of suspicion. Now in referring to these methods, we have need to be cautious in our criticism. There are equal dangers in protestation against them. The emphasis upon individual thought and independence may indeed suggest a sort of self-imagined superiority. It may be a wrong thing to have our ears to the ground ready for each movement of public opinion, but assuredly it is equally wrong to despise the value of herd-psychology, and to forget that in association or in community there is a useful restraint on the vagaries of the individual. In striving, therefore, for the balance, it is as well that we should attempt an analysis of latter-day attempts to influence the public mind by suggestion. It has been done unscrupulously. There are vast corporations in America which have succeeded in turning the edge of public suspicion by means of creating atmospheres. There have been instances where transit companies, in particular, have been able to divert public attention, by means of clever advertisements, from aspects of their work and enterprise which would hardly stand investigation. But apart from this, the unscrupulous use, there is an interesting study of other methods of indirect advertisement I noticed an advertisement the other day in an American journal the purport of which was to sell a certain article. It described the factory, the thousands of machines, the whir and the hum of the machinery, the brightness of the operators, the methods of welfare, the rapid promotion of the geniuses in the employ of the company, the wonderful financial progress of the whole concern. Then at the bottom of the page there was a single line,—"If we can do this we can surely deliver the goods." It created an atmosphere in favour of the company. Much the same has been done by great commercial concerns in England, who have garden cities with special care for their staffs. They have a right, I think, to use the fact in their advertisements, for it indicates at least that they recognise that, in the public mind, there is the fundamental idea that a fine organisation means a worthy product. We cannot believe that it would be otherwise. The psychological infection may impress us in various ways It may give us a sense of confidence, and of trust, and of respect when we are not at all aware that we are gathering such impressions. There is a mysterious sensitiveness to agreement in the public mind. It was observed in Melanesia by Professor Rivers that the inhabitants would meet together and discuss questions quite fiercely and that very soon they would pass to other questions. Dr. Rivers was rather surprised and asked for an explanation. The reply was that they had reached agreement. There was no vote or any other method of deciding it openly: the men had become impressed by an instinct, which had been operative for hundreds of years, with the fact that they had now reached agreement. It did not need a vote or a show of hands, or even an articulated word. In some such way the use of psychological methods in the cultivation of public sentiments may awaken some old instinct and quite sub-consciously agreement may be reached. It is by this means that publicity on the bolder canvas has come to work in recent years.

Then there is the fifth category, which is rather different. It is the reasoned process. It may use a couplet or a tag to memory, but it is frank and fair in its statements, and wishes to argue point by point. One of the earliest was the well-known couplet, "They come as a boon and a blessing

Digitized by Google

to men, the Pickwick, the Owl, and the Waverley pen." In later days other couplets have been used, and they are more definitely whimsical, such as "The ghost of tabby, fed on skim, was all the war had left of him." It proceeds to tell you of another milk which is "full-cream to the brim." Then there are the admirable reasonings in the form of a column of good journalistic matter. Mr. Selfridge began this with his admirable writer "Callisthenes." The Underground Railway and Messrs. Lyons have followed. I think myself that these are a reaction from what I have called the psychological method. Certainly they pay mankind the tribute of cold reasoning; they call on the reader to follow the argument step by step. Other methods are known to you. There is what I might call the contra-positive method, which tells you quite boldly the demerits of the article, such as that most effective advertisement of Brooks' Monkey Brand,—"won't wash clothes." Mr. Ford, in a sense, has adopted this method in his later advertisements, which consist of funny stories showing the sad experience of some of his purchasers with their cars. It may seem to be an audacious method, but it has undoubted advantages. Not every manufacturer would tell this story of his product. A car owner insisted on seeing Mr. Ford personally. "Is it true that you build a car in ten minutes?" "It is," said Mr. Ford proudly. "I've got that car," said the visitor. Or the other story of the man who tried and tried to sell a Ford car, and in despair, advertised the fact that at a certain hour it would be put in the road for anyone to take away. He put it in the road accordingly, and peeped through the window to see what would happen, and saw ten other men bring their cars to the same spot. Again, this was a daring story. There is, however, a psychological explanation of this audacity. People's minds may become so deadened with the older methods of publicity, that the very audacity of the later method may be attractive.

Now, where does a public utility like the Post Office stand in respect of all these methods of publicity? At the first blush it might appear that a true public utility wants none of the devices. I am rather tickled at a paragraph in the *Westminster Gazette* this morning, in which it is suggested, after the manner of Plato's Republic that statues might be used for the purpose of showing the value of telephony. "In another place," he says, "I would have them erect a figure of a man of serene and benign countenance, beautiful to behold, engaged in holding communication through the telephone, in the manner of one tasting the nectar of the gods, that those perceiving it may reprove themselves and carry the image of that man in their mind's eye and model themselves upon him to the delight of the governors of the telephone." I am afraid that such a use of public statuary would hardly achieve its object. A public service has been established by public will to supply a public need, and it would not seem, therefore, to require any of the psychological methods which I have mentioned. To say that, however, is to overlook some factors in the case. The Post Office performs a large number of mixed services, and it is quite clear that the public has only a vague understanding of these services. I can speak for telegraphs in London, and I assure you that in recent months it has been simply amazing how ignorant are even firms of the highest repute of the value of some of the services, especially the foreign services, which we are giving. There is no doubt a great deal to be gained from some such method of enlightenment. One of the advantages of the Imperial Cable to us has been the greater intimacy which it has opened up with the commercial public, and the opportunities which it has afforded of frank discussion and of frank explanation of the ramifications of the service. Theoretically, the public ought to set out to know what these public utilities attempt, but the fact is that the duty is neglected. Accordingly, I am driven to the opinion that the Post Office must take some action from time to time to explain to the public the different services and especially the new services as they are introduced.

But there is another aspect of publicity in respect of public services. It is necessary at times that there should be defensive action. Misunderstandings do arise, and in some cases they have been actively fostered by interested persons. I have already referred to the infectious character of a general public sentiment, and an atmosphere of distrust can be more readily cultivated than an atmosphere of trust. For this reason I think it is a duty to be able to explain to the public any matter which calls for explanation. Unless this is done we are apt to be at the mercy of unscrupulous persons who have axes of their own to grind. If you hear day in day out of faults in the telephone service, you are apt to imagine that little difficulties which you may experience are part of the general inefficiency. You will let one swallow make the summer because someone else has already suggested to you that it is summer. Now it is for no one's good to have such misunderstandings spread abroad; it is not for the good of the staff, or of the administration, or of the public outside us. Sometimes indeed attacks can be forestalled but in any case I think it is of vital importance that there should be an expert, ready at all times to state coldly and faithfully the full truth to the public. It needs expertness. It needs the psychological skill which is able to put cold and passionless truth in the place of many mis-statements which already have influenced and poisoned the public mind. There is a wide distinction between this publicity and that, to which I have referred, which uses psychological methods to mask the truth. Formal publicity, in the way which I have mentioned, must of needs be just as skilful and as wide in its knowledge, but it will be direct and truthful as well as enlightened and skilful, for its rôle is to put the public in possession of the full facts before forming its opinion. It will not attempt, I think, any of the tricks of the propagandist. The public is quite ready to learn, but it does ask for a skilled and experienced teacher. It is of the utmost value to the service also that there should be a channel, an authoritative channel, of information to the public at large, for only by this means can it be assured that the information is given as it were from the point of view of explanation, and not of propaganda. It is for this reason that the public has been invited to telephone exchanges and to the Central Telegraph Office, and for this reason, too, that a most careful film was taken of the processes of modern telegraphy. Many millions will see that film. I hope they will be led by it to a more complete understanding of what goes no in the mysterious interiors of telegraph offices. It has been completed by Captain Calvert of the Gaumont Company with insight and intelligence, and I am sure as the pioneer of a series of industrial films it will have a profound influence in telling more than one-half of the world how the other half lives. Similarly I would refer to lectures on telegraphy which have been given by officers of the C.T.O. staff to various audiences and have been most warmly welcomed.

Beyond this I do not think that a public utility service should go. Some of you think, I know, that if we had a campaign of advertising we could expand the telegraph service. Personally, I doubt it. More than that I doubt if it would be right to make any appeal to the public to use any service, or if it would be wise to transfer the idea of public service to that idea of commercial service in which case gain and not necessarily service is the prime end. To make a necessary service remunerative is not quite the same thing as to aim at remunerativeness only. To suggest the value to the public of a particular service is a totally different matter. For example, I cannot imagine that anyone would doubt the usefulness and the efficiency of the service by which telegrams may be handed in or delivered by telephone. Yet one of my day-by-day puzzles is to understand how it is that so many telephone subscribers are unaware of the service. I see a distinction between making the service known and using methods of advertisement to cultivate a need for it. Similarly, there might be mutual advantages from showing the public in what ways they could co-operate with us in the various services. I read the other day that if the public improved its technique in respect of the telephone service, it would result in a saving of £17,000 per annum. I am pretty sure that that is an understatement. In any case, publicity which tends to the improvement in efficiency by educating the public in the use of the services is surely of the greatest advantage. Services which are very complex, like our own, which render various kinds of different service covering a wide area of public need, touching different sections of the public, commercial and social, at varied points and always expanding in their inclusiveness of range, do need some sort of periodical elucidation if the public is to understand all that is placed potentially within its reach. I can hardly imagine the Metropolitan Water Board putting out an advertisement to the effect that if you just turn the tap you will get a rich and abundant supply of water, or quoting statistics to show the advantage of a daily bath. Public utility of the uniform and simpler kind supplies a need which the public has realised and consequently the demand for it does not need encouragement, either psychological or otherwise. Gas and Electric Light companies do advertise, but it should be remembered that herein is a keen competition, and the method of publicity is as much defensive as it is an encouragement to the user. I know that it may be used against me that the American Telegraph and Telephone Company does advertise most extensively. To that I reply that it is not at all proved that advertising in such circumstances is done purely to attract more business. Rather, I think, it is part of the educational process and part of the defensive process. I daresay we might have lights in Piccadilly Circus which would induce in people's minds the necessity for having telegraph and telephone communication, but I am not at all sure of it. Certainly it is true that the wide public know of the existence of these services, and use them up to their need. But to show the public in what particular ways they can get the highest benefit out of the services is another matter. On the other hand, it may be seemlier in these days for a public utility to take rather a sober attitude in its relation to the consumer. Men and women were not sent into the world merely to send telegrams and to speak by telephone.

I very much question if we could adopt in this country the methods of advertisement which have been adopted by our friends the Western Union Company of America. The temperament and attitude of our people are against it. Such an advertisement as that which is directed to commercial travellers, telling them that mothers and wives and sweethearts are anxious to hear from them, is based on the essential sentimentalism which is so large a factor in life in America. Similarly the model telegrams for use on occasions of death or distress, with their variously-worded sympathy, would be resented on this side of the Atlantic. We might perhaps take a leaf out of the Scandinavian book and have beautifully printed forms for wedding congratulations with wreaths of orange blossoms festooned round them, but even so, I doubt if they would be acceptable. The English reserve is a strangely-deep characteristic, and though it does seem that the English individualism has given way to psychological handling in some respects, there is no evidence of any surrender of the intimacy of the personal life. Our business deals with the personal life and it is a factor which is of vital importance. Men may be persuaded to purchase a hat or a collar or a sideboard or a motor-car of a certain kind; women may be persuaded in other ways, though I doubt if they are as pliable. Neither men nor women in England are likely to respond to appeals which are necessarily based to a greater or less extent upon their deeper sentiments. We are apt to look at these matters from a purely professional point of view, just as the American fashionable tailor sighed when he saw Abraham Lincoln's coat, and like the scornful articles which appear in "The Tailor and Cutter," on the pictures in the Royal Academy. It is something to be a public servant ready and eager to help and to help with the utmost efficiency, paying the public the subtle tribute of believing that it knows when it wants our help and that in the end it will appreciate a service of uniformly high quality and will appreciate any advice or suggestion which we can make with a view to cultivating more intelligent co-operation in the use of the services. Perhaps it is given to us

Digitized by Google

in a humbler way to do something to restore the balance. It is no mean allotment of responsibility in days when advertisement has come to be an expert art and science. There is room for us to enlighten the public, to remove all sorts of misunderstandings as they arise, to deal with either organised or unorganised opposition, should it arrive. But beyond this, as a purely personal opinion, I venture to think that the Post Office should not go, and that in refusing to go it would be performing a public duty and paying a tribute to the intelligence of men and women of the day which will prove to be not the least important of its functions.

To sum up, a public service of its essence is both proud and humble. It is proud to be the servant of the servants of the people. It differs essentially from commercial adventure in that it must be less insistent upon its claims, less dominant in its attitude, less inclined to transpose the importance of consumer and producer. Yet if it is to be truly efficient it must not shrink I think from saying to its masters that in this or in that way are its services more available, that in this or in that way can it more efficiently fulfil public needs, and more definitely add to the welfare and corporateness of general life. No man is a hero to his valet, and similarly it may be claimed that no valet is a hero to his master. But it may be permitted to the humblest valet to suggest to his master what suit should be worn and in what way it might best be worn. From this rugged parallel one may see limits to publicity in respect of public utilities. They will serve, and not only stand and wait, but they may set out to explain and to enlighten and make their services intelligent and their loyalty and humility into a proud thing.

CORRESPONDENCE.

ECONOMY IN LINE TIME.

TO THE EDITOR OF THE "TELEGRAPH AND TELEPHONE JOURNAL."

SIR,—Mr. Teare's article under the title of "Synchronism" in your December issue comes as a welcome reminder that your columns are open to all and sundry for the discussion of their particular theories.

The last two years or so has witnessed probably the greatest epoch in the annals of the British P.O. telegraph service, viz.: the linking up of the chief distributing centres by means of the Baudot Multiplex System.

Those who are keenly interested in machine telegraphy very naturally develop expertness in a special direction, and among the various topics which from time to time come up for debate, we find the question of "saving line time" occupying a very prominent position, Mr. Teare endeavours to dispose of this question by adopting the Western Electric System merely on the strength of the fact that the distributor has a greater range on account of the special segments for correcting purposes being dispensed with, yet a moment's reflection will show that if all Baudot installations were replaced by Western Electric installations, the present unavoidable loss of line time due to the Multiplex principle, would not be materially reduced.

In order to get the full advantage of the carrying capacities of a number of lines of different KR values, it would be necessary to vary the rates at which the moving systems rotate, consequently we should not have a common standard for operating, whether the system in use was a Baudot or Western Electric, and the inevitable result would be chaotic.

If we are to have a fixed standard for multiplex working, and it is difficult to imagine that such a condition is not essential, then it becomes impossible to work all lines on full load no matter whether the method of operating is by hand or by tap-fed apparatus. To achieve this object we must have recourse to an automatic system such as the Siemens-Halske and others, wherein the transmitter may be rotated at a speed determined by the retardation of the line, and the mechanical performance of the receiving apparatus. This advantage of the automatic principle over the multiplex is not generally touched upon.

Mr Teare successfully demonstrates the superiority of the Western Electric over the Baudot in an isolated case in which the electrical nature of the line permits him to do so. The question cannot, however, remain here without investigation, and I would beg your indulgence at some length in order that we may consider the subject on a wider basis.

A line which will permit 1,800 reversals, viz., 3,600 alternate positive and negative impulses per minute, obviously has a transit time of 1/60th of a second. A distributor is essentially a time divider (with due acknowledgment to Mr. H. H. Harrison), and in Mr. Teare's case if we build it up with 60 segments of equal size it is quite clear the moving system must not be rotated at a greater frequency than one revolution per second. If the frequency be increased to three revolutions per second, which is the normal rate for working, then the contact time will be reduced from 1/60th to 1/180th of a second and in order that the contact time may be restored to its proper value, viz., not less than the transit time of the line, the number of segments must be reduced from 60 to 20.

For this particular line a 20-segment distributor is satisfactory for "Western Electric" quadruple working, but is two segments short of the number required for quadruple Baudot, and the capacity of the distributor in the latter case is triple. The superiority of the "Western Electric" is then as four to three, not three to 2.7272 as claimed by Mr. Teare.

Assuming a standard speed of 180 r.p.m. the maximum number of segments permissible depends upon the transit time of the line, but as the number of segments will not always be a multiple of five, or a multiple of five plus two, it will frequently happen that we cannot avail ourselves of the full carrying capacity of a conductor. With equal conditions as to speed and voltages, the following table of a number of lines of different KR values shows the maximum carrying capacity of each line and its equivalent value in "Western Electric", "Baudot," and "Siemens-Halske" working:

	Transit Time—Seconds.	Maximum number of Segments.	Carrying Capacity of Line Reversals.	Carrying capacity number of words per minute.		
				Western Electric.	Baudot.	*Siemens-Halske.
a	.0196	17	1,530	90	90	102
b	.0185	18	1,620	90	90	108
c	.0175	19	1,710	90	90	114
d	.0166	20	1,800	120	90	120
e	.0158	21	1,890	120	90	126
f	.0150	22	1,980	120	120	132
g	.0144	23	2,070	120	120	138
h	.0138	24	2,160	120	120	144
i	.0133	25	2,250	150	120	150
j	.0128	26	2,340	150	120	156
k	.0123	27	2,430	150	150	162
	Aggregate			1,320	1,200	1,452
	Average words per minute			120	109	132

* Automatic.

In the above table it will be seen the Western Electric is slightly better able to make full use of the line time notably in *d*, *e*, *i* and *j*, than is the Baudot; it also enjoys an advantage over the latter varying from nothing to 33.3 per cent. in the matter of carrying capacity, but this is due to the principle (not the performance) of its correcting arrangements.

The last sentence of paragraph 9 of Mr. Teare's article is somewhat perplexing. The circumstances in which the correcting currents will fail when at the same time the working currents arrive intact are surely of an exceptional nature.

All impulses are distorted more or less as a normal consequence of the electrical nature of the conductor, and such distortion is the result of several factors which determine the working speed of the line.

If a correcting current be lost the cause is undoubtedly due to some extraneous interference and we must expect also the loss of working currents. Mr. Tyrrell's contribution in the December issue is very appropriate to this point. The effect of the "saw-teeth" distortions in the rise of the waves is not sufficient to disturb the working; they merely delay the rise of the currents. The tongue of the relay passes from one contact to the other at a definite point in the arrival curve of the current, and unless and until an impulse of opposite polarity reaches the same relative point in the wave, the tongue of the relay is not disturbed.

Furthermore in Baudot working we find that although the correcting impulse is due to arrive each revolution, it is only occasionally that we have a use for it; the frequency of utility is very low where the moving systems are driven by phonic motors, therefore, the possible loss of two or three correcting impulses would not detract very much from the merits of a quadruple duplex system, which has carried 26,096 telegrams in six consecutive days with a total loss of line time of 13 minutes and no failures in synchronism over the whole period.—Yours truly,

R. PRATLEY.

Liverpool, April 3.

THE EDINBURGH TELEGRAPH AND TELEPHONE SOCIETY.

A MEETING of the above Society was held on March 28, Major Jayne presiding, when a paper was read by Mr. E. H. Fisher on "The Zone System as it affects Edinburgh."

Mr. Fisher said the Zone System of telegraph circulation opens up a new era in telegraph management. Prior to this system the circulation of telegrams between areas was governed by arbitrary factors which varied

Digitized by Google

at different times. The Zone System promises to wipe out anomalies in circulation and to elevate circulation of telegrams to a science.

The system is built upon basic circuits along which traffic must circulate. From the small office to the group centre—from the group to the area centre—from the area to the Zone centre, the basic circulation follows the basic route.

If, however, there is sufficient traffic between one minor office and any other office, other than its group centre, a non-basic wire is allowed.

The anticipation is that the Zone centre inter-communication wires will carry better loads than obtains at present. The Baudot Quadruple Duplex is a unit sufficiently elastic to meet the demand of huge bursts of traffic and at quieter periods to contract to a small staff. The future of the Zone System is intimately bound up with machine telegraph working between Zones.

Mr. Phillips: If instead of having your work diffused over a great number of minor points you can concentrate upon a few major points you are on the way to fixity and stability, for you will legislate for the bulk and in the bulk you will have fixity.

Some of the experts of the Traffic Section will perhaps one day tackle the problem of transmissions and define exactly the extreme length of a reliable fast working wire and fix the point where greater speed and accuracy is obtained by transmission than by direct working. The absence of a standard is, I think, a weakness in our organisation. There is such a thing as specialisation in transmitted work. Every large office is not of necessity a first-class transmitting office. Transmission must be specialised, for it has its own particular requirements.

Messrs. Dodds, Dickson and Allan (Secretary's Office) also spoke.

Major Jayne and Messrs. Fisher and Moncrieff replied to the criticisms.

An extra meeting of the Society was held on March 31 when a paper written by Mr. J. Lee, Controller of Telegraphs, Central Telegraph Office, was read by Miss Moffat on "Some aspects of publicity in relation to Post Office Work."

A few points in the interesting discussion which followed are:—

Mr. Dickson: One of the things mentioned was the fact that the public had never heard of the Phonogram. He thought we were not doing our duty when such a state of things existed. He suggested that a booklet should be handed to subscribers when telephones were fitted, and some advertisement of the services should be made in the directories. It would make sure that the subscribers would know the use the telephone could be put to.

The only time telephones appear in the Press is when held up to odium: no doubt whatever that this is due to malice aforethought got up for certain reasons. The service is made a scapegoat and is unable to hit back. It seems to me that if Departmental legal experts put their heads together to find some way out it would be possible to alter the law of libel to make slander against a class or Department or a trade as punishable an offence as a slander is at present against an individual. The untruths published were appalling. Every little newspaper repeated the stories and it was little wonder the influence on the public was very wide. A certain paper stated that the local telephonists received £6 weekly. This campaign was organised to show not that the public control of the Telephone Service was bad, but rather to show that nationalisation of any kind was bad.

Mr. Lee is a great authority on psychology and on application of it to vocations. But anything we could do to have a counter campaign under a publicity officer would do no good so long as the law stands as it does. The penny-a-liner knows nothing about the matter and cares less. America is ruled by him. It would be fine if we could stand up for ourselves in open Court.

Mr. Watson said he was sorry he was not able to follow all the arguments of Mr. Lee or even of Mr. Dickson. In his opinion efficiency is at the bottom of it all. It was no use handing in a telegram if we cannot deliver it quicker than a postcard. Telephones have been widely advertised, yet the public are ceasing to use them. The standard of efficiency must be raised. We have heard of a no-delay telephone service. We never hear of a no-delay telegraph service. Efficiency is at the root of the business, and is the best advertisement.

Mr. Rankin: The only open competition in the Telegraph Service was the competition of the "Imperial" with the other Cable Companies. The "Imperial" Cable can only give the same rate as the other Companies. Yet other Companies have higher wage bills. If benefits are to be had from the service the public using the cable should get the benefit. The P.O. wages were 25 per cent. less than the Cable Companies.

Mr. Swan said as regards Mr. Rankin's remarks *re* "Imperial" charges, these charges were, he thought, governed by the International convention. He was not sure that Mr. Lee actually favoured advertising, but it has been said that advertisement is to business what steam is to machinery. The Imperial Cable is being widely advertised, and other services might with advantage also be advertised. It was no unusual thing to be asked by members of the public *if they can send telegrams and how to send them.*

Mr. Gow said the point which appealed to him was that of taking films showing the P.O. at work. There was no better way than by showing films of the work done by the P.O. if the public were to be made aware of the P.O. services. The Post Office should be the best known, whereas it is the least known.

Miss Moffat desired to supplement Mr. Gow's remarks—we must have publicity and real explanation of the services. How many people know about a telephone letter for instance? The P.O. is not necessarily a remunerative service, and we should popularise the services. The ideal of a public service is to supply public needs. The Federation of British Industries were responsible for financing the campaign of attack during the Telephone Ramp.

Major Jayne: Mr. Lee's paper very ably demonstrates the various effects of re-iteration. I am personally quite convinced that Pears' Soap is "matchless for the complexion," for that statement has been hurled at me thousands of times by advertisement.

There are many services in the Post Office that ought to be brought more prominently to the notice of the public—to give one instance, the Night Telegraph Letter Service.

In America I notice that the public are informed by advertisement that theirs is the finest Telephone Service in the world, with the result that it has become an accepted fact. In Britain it appears to be thought that ours is the worst—this is the result of re-iterated adverse criticism.

Many people in the Post Office do not like this adverse criticism. I am all in favour of it so long as it does not go too far. I believe criticism is the salvation of many services inside and outside the Government. It saves the Post Office from becoming smug; it leads to a tendency to become super-efficient, and if it makes us continually on the look-out for the improvement of our service it is all for good, both for ourselves and the public. All I ask is that we should get an occasional pat on the back.

Let us be known by our works in the Post Office.

Mr. Dickson moved a vote of thanks to the committee for their arrangements in connexion with the meetings.

Mr. Fisher acknowledged the vote on behalf of the committee and said the help he had received was invaluable.

Mr. Swan moved a vote of thanks to Major Jayne for his interest in the Society and his excellent Chairmanship of the meetings. The interest aroused had been very great.

TELEPHONE CALLS—RECORDING BY THE PUBLIC.

THE application of the new message rate tariff for telephone calls, as was anticipated, has made subscribers more careful in their use of the telephone, and many are endeavouring to keep records of their calls in order to check the Department's charges. The result has been that a considerable number of subscribers have challenged the amounts debited for local calls in their accounts, and some rather heated correspondence on the subject of over-charging, has been carried on in the public press. In order to test the subscribers' ability to keep an accurate record of their consumpt, 50 cases were selected from the disputants of their September quarterly account, and special records of their calls were taken during two or three days in each case. These records were compared with the subscribers' records and some useful information came to light which may be of interest to readers generally.

The subscribers had various methods of keeping their records, some showing a certain amount of care and others great laxity. The form of record mostly in evidence was in the nature of a small loose-leaf day book or note-book showing the time and the telephone number of the call. A number had some form of mechanical counter and others used small squares of papers which were filed on a wire file. One subscriber rather humorously stated that he had solved the problem of a simple method of recording his local calls, and that was a cardboard box with a small hole in the top into which a pea was dropped for each effective call. It was suggested that a butter bean might represent a trunk call. In the cases where mechanical recorders were used, the record could rarely be checked as the figures were continued from the beginning to the end of the quarter and daily readings were not kept. Some records were kept on loose pieces of paper and there appeared to be a danger of some of the slips being mislaid. There was also some dubiety as to the counting of $1\frac{1}{2}d.$ + $1\frac{1}{2}d.$ calls as two local calls.

Digitized by Google

The number of test cases made was 50 and the results worked out as follows :—

Percentage of under-recording on the part of subscriber.	Actual number of cases.	Percentage number of cases.
5 per cent. and under	5	10
10 ,, ,, ...	11	22
15 ,, ,, ...	19	38
20 ,, ,, ...	23	46
25 ,, ,, ...	26	52
30 ,, ,, ...	32	64
40 ,, ,, ...	35	70
Over 40 per cent.	2	4
Number of cases where subscribers' records were approximately correct ...	7	14
Number of cases where subscribers' record could not be checked owing to the absence of daily totals	5	10
Meter faulty	1	2

Taking the figures in bulk, the average percentage of under-recording on the part of the subscribers, was 15. The percentage of cases where the subscribers' record was wrong, was 84, and the percentage where the error was over 5 per cent., was 73. Where the subscribers' record was approximately correct it generally happened that the subscriber was a small user and had the telephone under his personal surveillance.

The recording on the part of the operators was very correct as a rule, and any cases of over-recording were attributable to the subscribers not keeping in touch with the operators in cases of difficulty, such as failure to advise the operator when a wrong number was obtained, and not advising the operators that no reply was being received.

Some rather remarkable cases of failure to record on the part of the subscribers transpired. One firm complained that they were charged 1,200 calls for the quarter while their record was slightly over 400. Thinking that some serious mistake on the part of the subscribers had been made, a visit was paid prior to taking a special record, but the firm maintained that no mistake on their part had taken place. A two days' record showed that the subscribers passed 30 effective local calls during this period, and on a comparison of the records being made, it was found that the subscribers had omitted 18 calls. A remarkable performance. One subscriber made 4 calls while the writer was in his office, and as he did not appear to make any note of the calls he was asked at what time he did so. He replied that he entered them periodically and that he always remembered his calls. Result—a third of his calls omitted.

The majority of the subscribers failed to take a sufficiently long view of their discrepancies. For instance, one subscriber was charged 200 local calls for the quarter, and he made a great noise because his record showed 24 calls less. On comparing his record with a special observation for two days, it was found that he had omitted 1 call out of 9. He admitted having the call, but stated that one call was neither here nor there. On an explanation that 1 call omitted out of 9 was 11 per cent., and 11 per cent. on 200 was 22, a figure very near his discrepancy, he was rather astonished, and then made a tirade against quarterly accounts. It was sometimes amusing to find a subscriber admitting that he might quite easily omit to record 2 or 3 calls per day, but he would never admit a discrepancy of 200 per quarter. The explanation that 2 calls omitted per working day amounted to nearly 160 per quarter rather staggered him.

The frivolous call has been largely cut out by the new rates, but it was found that in some cases the number of private calls to business calls was still very high. In one case of a large user it was found that a third of the calls were of a private nature. The principal was asked " if the staff were allowed to make private calls," and he replied in the affirmative, but that they were charged with the value of the calls. He was asked how much he got a week from this source, and it transpired that about 1*s.* was a good weekly figure. When he was told that he should be getting about 3*s.* per day, there was a storm in more than a tea-cup.

In interviewing the subscribers, the necessity for acting up to the printed instructions regarding the avoidance of overcharge was emphasised, and it was put to them that in ordinary business if they did not get the goods they let the suppliers know, therefore they should keep in touch with the telephone operator until they had obtained the call or let her know if there was difficulty. The investigations were received cordially as a rule by the subscribers, although in one or two cases there were many boisterous moments during the interviews. Others again were only too pleased to have the shortage pointed out, as it reassured them of the Department's methods. Some subscribers asked if it were worth while keeping a record, but they were told to please themselves ; only if they kept a record they should keep it intelligently and make allowance for possible omissions. The desirability of not slavishly considering that their records were correct and making an intelligent allowance for possible failure was impressed on the subscribers. It is thought that a certain amount of good has been accomplished by the investigation, but time will tell.

LONDON ENGINEERING DISTRICT NOTES.

New Telephone Exchange.

ON April 1 a new C.B. No. 1 type Exchange, known as Maryland, was opened at Jupp Road, Stratford, to replace the old Stratford Exchange which was opened in 1896 and the relief exchange, known as Broadway opened since the Armistice. The equipment is of the Western Electric Co.'s type and consists of 16 " A " and 11 " B " positions with subscribers' line capacity of 4,000. The nucleus of the exchange was formed by the transfer of 575 lines from Stratford ; 394 from Broadway ; 116 from East ; and 45 from Walthamstow. The exchanges from which the lines were transferred are of magneto, C.B. No. 9, C.B. No. 1, and C.B. No. 10 types respectively, and this fact increased the difficulties of the transfer.

Electrophone Service.

The number of electrophone subscribers is now approaching 2,000 This constitutes a record number of subscribers enjoying this facility.

Engineering Stores.

The following figures regarding the stores required to feed the London Engineering District for the progress and upkeep of the Telephone and Telegraph systems will be of general interest, and will give some idea of the magnitude of the engineering work dealt with by the Post Office in the Metropolis. The figures quoted are those for the year ended Dec. 31, 1921, and represent the value of stores used and recovered in connexion with the installation of new plant, alterations to, and improvements of existing plant and the maintenance of the two systems :—

Value of stores used	£1,044,229
Value of stores recovered	£395,014

The handling of these very large quantities of stores is a work of considerable magnitude and a few remarks as to how it is done, will, it is thought, not be out of place. A large proportion of the material is delivered direct to the scenes of operation by the Stores Department, and some of the recovered stores are returned direct to that Department, but a very substantial balance is dealt with through the medium of section stocks. For the information of the uninitiated it should be explained that section stocks are stocks of stores held at convenient points in each engineers' section for the ready distribution of stores required for the provision of new " subscribers' " circuits, and for " small works " incidental to the local installations. There are 39 section stocks in London, located mostly in telephone exchange buildings, which give employment to 106 men. The normal value of the stocks is approximately £60,000, which includes apparatus and tools for exchange and loan purposes to the amount of £15,000. During the year 1921 the turnover through section stock was £371,313 stores issued and £68,424 stores recovered, the handling of which involved the considerable total of 414,224 transactions.

Other units of work performed during the year by the storemen, but which cannot be expressed in money values, were in round numbers, 200,000 maintenance exchanges, 40,000 loans and 170,000 issues of small stores. The number of workmen catered for by these section stocks is 4,736.

Digitized by Google

In addition to section stocks, small stocks of items essential to the day-to-day maintenance of exchange plant and of that installed at subscribers' premises, also fire alarms and telegraph circuits, are held at various points by workmen. These small stocks are called "Normal Stocks" and there are 96 of them, with a total value of approximately £15,000, meeting the requirements of about 300 workmen.

One very important type of store necessary to telephone and telegraph construction, but which is not included in any of the figures quoted, is poles. To meet the districts' requirements of these items, 14 pole stacks exist; they are situated mostly in the outlying suburbs. On Dec. 31 last 697 poles were available for immediate use, in sizes varying from 26 feet light to 80 feet stout. This stock forms what is known as "District Depot Stock" and is held by the Superintending Engineer in trust for the Stores Department.

London Engineering District Clerical Staff.

The eleventh annual clerical dinner was held at Anderton's Hotel, Fleet Street, on Friday, Feb. 24. Mr. F. Freeman presided and was supported by Mr. J. R. Williams in the vice-chair. Mr. A. E. Cooke, the Principal Clerk, was the "Guest of the Evening." One hundred and thirty-four members of the clerical staff from the headquarters and sectional offices were present. The number included former colleagues who had gone to other Departments.

A very excellent musical programme, which was much appreciated, was provided by members of the staff. Mr. J. W. Kimber, the musical director, was assisted by Messrs. S. L. Bickerton, J. H. Chubbock, C. W. Cornwell, S. C. Edser, A. W. Edwards, C. A. Edwards, T. Flannery, H. W. Gardner, J. J. Gerke, E. F. Griffiths, J. W. Hamilton, Chas. Harris, W. J. A. Payne, H. G. Reeves, E. J. Ruffhead and G. H. Stanbridge. Mr. Chas. Forwood was engaged for the piano.

Mr. Freeman, in proposing the toast "The Guest of the Evening," stated that he had been associated with Mr. Cooke for 20 years and a very pleasant association indeed it had been. They would miss him very much—Denman Street would not be the same without him—and he was sure Mr. Cooke would miss Denman Street. He had been the personification of energy, as all knew, and they hoped that young as he really was, he would always keep young, and the setting sun of his official life would bring the dawn of a bright private life. Mr. Cooke had won their respect by force of character. All knew him as an upright and particularly well-intentioned man, traits which would continue to carry him far in his activities when he left the office, whether in connexion with Borough or wider political work. In conclusion, he wished Mr. Cooke the very best time, a better time than ever before. The toast was received with musical honours.

Mr. Cooke, on rising to reply, was greeted with prolonged cheers. He expressed his gratitude for all that had been said. He felt proud to have been associated with such a staunch body of colleagues and thanked the staff for all the kindnesses he had received during the many years he had served in the London District. He was retiring from the Service because he had reached the age limit, but he still felt young in spirit, and having been blessed with exceptionally good health he was hoping to find other activities to occupy his time and render good service to his country. It was his desire to take up political, municipal or charitable work. He was pleased to see his old friend and colleague, Mr. Heath, also many former colleagues who had passed to other Departments. Their presence was much appreciated. The staff had his best wishes and, if they thought fit, to allow him to join in future festivities, he would be delighted to be present.

At the conclusion of the evening, Mr. J. R. Williams proposed a cordial vote of thanks to the artists, and referred particularly to the items contributed by those who had recently been transferred from the Provinces.

Mr. W. J. A. Payne proposed "the Chairman and the Committee" who had organised a very successful and enjoyable function. Mr. S. Lees Bickerton seconded.

Inspectors' Annual Dinner.

The London Branch of the Inspectors' Society held their second annual dinner at Connaught Rooms, on Monday, April 3, 1922. There was a good attendance, an excellent innovation being the presence of ladies. The Chair was occupied by Mr. J. D. Boulton, Chairman of the Branch, and among the guests were Mr. and Mrs. R. McIlroy, Mr. and Mrs. W. A. Williams, Mr. and Mrs. T. Bagley and Mr. C. Bromley. The dinner was followed by a musical programme, which was thoroughly enjoyed by all present.

Mr. T. Bagley (General Secretary), in proposing the toast "The Society," expressed the opinion that the creditable report of the Geddes' Committee on the Engineering Department was due to some extent to the efficient staff organisations. Mr. W. A. Williams (President), responding, touched upon the success of the Society in obtaining representation on the Professional Officers, Group A Committee. "The Post Office Engineering Department" was proposed by the Chairman, whose statement that he looked forward to the day when the Department would be controlled by an engineer, was received with loud applause. Mr. R. McIlroy (Superintending Engineer, London), responding, contrasted the conditions 30 years ago with those of to-day, and his statement that promotion in the future will be decided upon efficiency met with general approval. Mr. C. W. Messenger proposed the toast "The Ladies," which was responded to by Mrs. Maddocks in an excellent and well-delivered speech. Mr. A. H. Veale proposed "The Visitors," to which Mr. A. C. Greening responded with some extremely appropriate quotations from Mark Twain.

The musical programme was so consistently good throughout that it is difficult to select any particular item, but mention should be made of a string quartette of members of the staff, which played delightfully during the reception and interval. The greatest credit is due to Mr. E. W. B. Howe (Hon. Secretary), and the Dinner Committee for the immense amount of trouble they must have taken to have ensured such a complete success.

A New Type of Storage Battery.

An interesting article appeared in the *Electrical Review* of March 29 in which a new form of lead accumulator is described. It is a lead hydrate battery and is unique in many respects, and was invented by an Englishman. The following are some of the claims made for the new battery:—

(1) It has 300-800 per cent. greater capacity than any other battery has hitherto attained.

(2) It is indestructible as a battery.

(3) It is rechargeable in 15 minutes.

(4) It cannot sulphate.

(5) It has a much longer life than any other battery.

(6) No deterioration takes place if the battery is left for an indefinite period at any stage of charge or discharge.

(7) It is capable of being discharged at rates very considerably in excess of the normal without deterioration.

Although the inventor had in view primarily a traction battery, yet if all that is claimed for it is correct, there is a useful field for it in the telephone industry.

Messages over Trolley Wires.

Some satisfactory tests were recently made in the U.S.A. in the use of carrier currents to enable conversation to be carried on between a moving car and a sub-station, and also between the front and rear of a long-freight train, the carrier currents being superimposed on the trolley wires. There can be no doubt as to the utility of such an arrangement, but it is questionable whether intercommunication on a moving train would not be more easily and cheaply provided by older methods. Although the solution of the problem of communication between a moving electrical train and the power station has now been found in the use of carrier waves, other methods were under consideration in this country some 15 years ago by a telephone engineer, who is at present a member of the Post Office Research Section.

Vitamines.

Speculation is rife in the scientific world as to the probability of being able to extend the span of human life considerably beyond its present limit when more exact knowledge of the action of vitamines on the human system has been obtained. If it becomes possible to ensure continuity of corporeal existence say for 200 years, will the age for retiring be extended or will it be possible to enjoy one's pension for the extended period. It may become necessary for all Civil Servants before becoming established to take an oath to abstain from the consumption of vitamines. No doubt the National Whitley Council will bear the matter in mind.

LONDON TELEPHONE SERVICE NOTES.

After Hours.

To those who read Mr. E. J. Lansbury's paper on night service in a recent issue, and visualised an ever-ready night force anxious to render instant service no matter what the hour, it comes as a surprise to learn through the medium of the recently published Report on the Telephone Service, that in some parts of Norway only "the larger Trunk exchanges are open continuously.* In the smaller exchanges there is no obligation for attendance at night, but any subscriber who succeeds in gaining attention is charged 6.7*d.* extra." In other parts of the country the service is available at night, but extra fees are charged for each night call, varying according to time and place, and these fees are paid to the operators concerned. One wonders in the first instance, whether the staff are encouraged to drop in if they happen to be near to the exchange on the off-chance that somebody may be calling.

Critics in the past have been rather fond of comparing the London Service with that which they claimed to have had experience of in Scandinavian countries, but here at least we need not fear comparison. Not a telephone in London remains inoperative because of non-attendance at the exchanges. Except for three or four exchanges in the care of resident-telephonists, London exchanges are staffed regularly at night. This is not the only advantage the London subscriber has. He does not pay more for night facilities, but if he calls a distant town he gets the advantage of reduced fees.

The advantages of being able to telephone at all hours of the night are not confined to subscribers in London. At many exchanges there are all-night public call office facilities for the general public, and there can be no doubt

(* This is the rule all over the Continent.—EDITOR, *T & T.J.*)

Digitized by Google

that they have proved most valuable in cases of emergency, especially as telegrams may be dictated from them.

London subscribers also have the distinction of keeping traffic officers from their beds at night, and in certain urgent cases repairs are carried out, so that London should be thankful, though we say it.

* * * *

Pre-Payment Coin Box.

It may be of general interest to remark on an experiment now proceeding with a new type of coin box, the special feature of which is that three pennies have to be inserted by the caller before the exchange can be signalled. The caller, once in communication with the exchange, can deposit the coins in the separate cash box or get them returned as he wills, but an ingenious device prevents him speaking to the required party until he has let the coins go into the cash box, although he can hear all that is going on. If the experiment is successful there will be considerable advantages over the type of coin box now in use; chiefly on account of the saving in time by not having to collect the coins individually during the progress of the call.

* * * *

Langham Choral Society.

The Society held its third and last concert of the season at Queen's Hall on March 28, when an excellent performance of Coleridge-Taylor's increasingly popular "Hiawatha" was given. The hall was filled to its capacity; only two seats remained unsold. It is gratifying to note that the Society has wound up the season with a substantial balance, and the fears that its activities might have to be curtailed for lack of funds are happily dispelled. One of the difficulties in connexion with an organisation depending chiefly on a youthful staff for its support, is the choice of works to be performed. It is hoped that the selection of "A Tale of Old Japan" for the first concert next season will meet the popular taste. It is with regret we note that Miss W. Nurse has resigned through ill-health the Secretaryship, a post she has ably filled from the commencement of the Society. Mr. W. R. Child of the Contracts Branch has taken over the duties.

* * * *

Inter-Branch Football Match.

In a spirit of friendly rivalry the Contract Branch recently accepted the challenge of the Accounts Branch to play a football match, which was decided on the evening of March 30, and resulted in a victory for "Contracts" by 2 goals to 0. A cold driving rain, which at times changed to sleet, failed to damp the enthusiasm, and a very enjoyable game resulted, despite the elements. The winners were perhaps fortunate in recording a victory by two clear goals, but they held just that advantage which entitled them to carry off the spoils. Cowdrey was responsible for both goals.

* * * *

Macbeth on the Bonus.

Is this a bonus which I see before me
Its back toward my hand? Come, let me clutch thee:
I have thee not, and yet I see thee still.
Art thou not, longed-for bonus, sensible
To feeling as to sight? or art thou but
A bonus of the mind, a false creation
Proceeding from the work-oppressed brain?
I see thee yet, in form as palpable,
As that which once I drew.
Thou softenest the way that I was going.

There's no such thing.
It is the (Shakespeare) business which informs
Thus to mine eyes.

J. McM.

* * * *

Culled from the Exchanges.

East Exchange.

The East Exchange staff held their annual social at the Limehouse Town Hall on Feb. 22, 1922, where a very enjoyable evening was spent. The programme consisted of music, dancing and games. The songs rendered by Misses Tyler, Godfrey and Mr. Moulds were greatly appreciated, as was the humourous recitation given by Miss Orme. A pleasant feature of this social was the reunion of many members of the staff who have now left the district. Mr. Arrowsmith kindly carried out the duties of M.C. Reference was made to the forthcoming bazaar which is being held in aid of Shadwell Children's Hospital at East Exchange on Monday, April 3, 1922.

* * * *

Regent Exchange.

Regent's last dance of the season was held on March 31 at the Shaftesbury Hotel. The knowledge that it was the last dance seemed to make everybody the more determined to get the utmost enjoyment from it. Mr. Buckeridge was M.C. and that fact, together with the floor and music, made the evening a proper success to finish a very enjoyable season.

The monthly whist drive at Gifford House was held on March 25. As most of the players are in invalid chairs and some even unable to move from their beds, these occasions demand much care and forethought in their arrangement. As M.C. Mr. Buckeridge overcame these difficulties, and with the help of the girls, a very enjoyable afternoon passed happily for all who took part in it.

* * * *

The Point of View.

I *hate* those horrid "B" girls,
The "A" girl made complaint;
The way they take an order wire
Would aggravate a saint.

They laugh and talk incessantly,
And calmly disregard
Our plaintive calls for junctions,
Yes, it's really very hard.

Their tones are pert and insolent,
They answer when they choose;
They give wrong numbers constantly,
Mistaking "fours" for "twos."

They always try to thwart us
With their "No lines," "Don't break in,"
And if we want a junction changed,
It's deemed a deadly sin.

We're "cut off" on an average
Ten calls in seventeen:
Yes, I *do* detest those "B" girls—
They ought never to have been!

O, time went on—as time will do,
The "A" girl changed her state;
For she must go to junctions too
Like other "A" girls, tried and true.
And straightway changed her point of view
And subject of debate.

I *can't stand* those horrid "A" girls,
This "B" girl then made plaint;
The way they use the order wire
Would aggravate a saint.

They "break in" on each other
And upset the order wire,
And pick up any junction
They may happen to desire.

Of course I'm blamed for it, although
They cause their own delay;
How *can* my service perfect be
When they behave this way?

They should be made to try their skill
At junctions for a space;
They'd soon begin to realise
It's scarce a "cushy" place!

But never mind, their time will come,
Then I shall think with glee
Now they will know the trials of
The girls whose work is "B."

DOROTHY TURNER.

MODERN WIRELESS TELEGRAPHY AND TELEPHONY.

BY F. ADDEY, B.Sc., M.I.E.E., FELLOW I.R.E.

(*Continued from page* 120.)

Interrupted Continuous Waves.

IT has already been mentioned (page 131, Vol. VII) that if a C.W. station wishes to communicate with one equipped only with apparatus for spark reception, the continuous trains of waves corresponding to the dots and dashes must be broken up into detached portions, so as to resemble the radiation from a spark station. The type of signalling so produced is known as "Interrupted Continuous Waves," or "I.C.W."

With commercial valve transmitters, the high tension supply is obtained from an alternator, the current pulses being rectified and afterwards made continuous by a smoothing condenser, as already explained. With such an installation, I.C.W. can be obtained by disconnecting the smoothing condenser. The voltage applied to the anode of the transmitting valve then pulsates, rising to a maximum once for each half-cycle of the alternating current supply. The amplitude of the radiated oscillations therefore varies in a similar manner, and consequently at the receiving station a note is heard, the pitch of which corresponds to twice the frequency of the alternating current supply. (The frequency of the supply is the number of *complete* alternations per second.)

Wireless Telephony.

With I.C.W. we are moulding the radiated waves to the comparatively simple form of the alternating supply and a simple musical note results. If we can mould the radiated waves to the complex form corresponding to speech, the corresponding sounds will be held at the receiving station, and thus the speech will be transmitted—(see page 132, Vol. VII).

There are several methods by which this can be done, but only one will be described here. The arrangement is shown in Fig. 33.

The connexions as far as the oscillating circuit is concerned are nearly the same as those of the valve transmitter already dealt with. In this case, however, a closed oscillating circuit, instead of the aerial circuit, is excited from the oscillating valve, and the oscillations in this closed circuit are made to excite the aerial through an oscillation transformer.

A valve, known as the "absorption valve," is joined across the secondary coil of the oscillation transformer, as shown in the diagram, and it is by means of this valve that the speech modulation is impressed on the radiated waves. The space between the anode and filament of the absorption valve provides a path by which some of the energy in the secondary coil is shunted away from the aerial. The amount of energy so shunted away evidently depends on the resistance offered by the valve, and this resistance depends on the grid potential. Thus, by causing the grid potential of the absorption valve to vary in accordance with the speech waves, the resistance of the valve is caused to vary in the same manner, the amplitude

Digitized by Google

of the oscillations in the aerial are modulated similarly, and so the speech is transmitted.

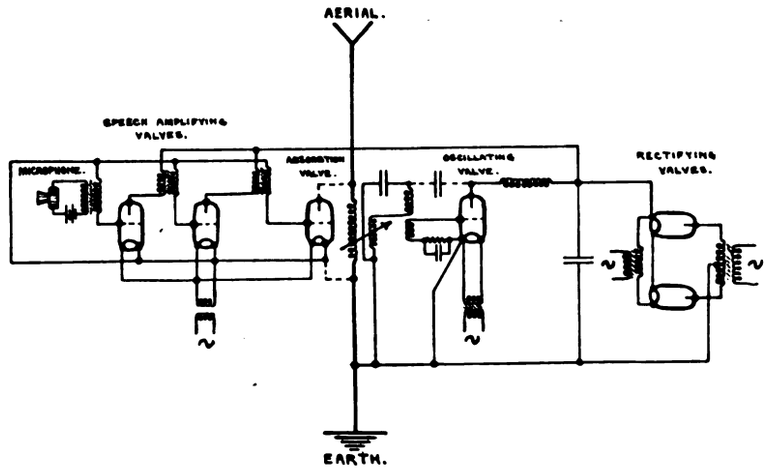
The speech modulations are impressed on the grid of the absorption valve by means of a microphone acting through two amplifying valves. The variations in the microphone current produced by the speech are impressed as voltage variations on the grid of the first amplifying valve through a step-up transformer. The variations so produced in the anode current of this valve are impressed through another step-up transformer on the grid of the second amplifying valve. Finally, the variations of the anode current of this valve are impressed through a third step-up transformer on the grid of the absorption valve, and the modulation of the radiated waves is brought about as already described.

The modulated oscillations set up in the distant aerial are amplified and then rectified in the usual manner.

It will be evident that for the clear reproduction of speech no distortion must be produced by the amplifier, that is, the amplified oscillations must be an exact copy of the received oscillations.

In order that this may be the case, the amplifying valves must be so arranged that the fluctuations in anode currents are exactly proportional to the changes in the grid volts, as mentioned on page 184, Vol. VII.

Land-line to Wireless Telephone.



The exchange of speech between two wireless stations is, of course, a very notable achievement. For commercial purposes, however, this is not enough. It should be possible for two telephone subscribers to be joined through their exchanges to the wireless stations, and for their conversation to be carried on as though they were connected by an ordinary line. A subscriber in London should be able to hold a conversation with a person on board a ship or an aeroplane.

It has not yet been found possible with wireless telephony to speak and listen simultaneously, as is done on an ordinary telephone circuit, when using a single wave-length for the wireless portion of the connexion.

When the wireless link is between two land stations, as when communication is effected between the mainland and an island, it is possible, by using separate transmitting and receiving stations at each end, and a separate wave-length for each direction, to reproduce the conditions of an ordinary telephone circuit, as far as the subscribers are concerned, and one can then if necessary, interrupt the other in the course of a conversation, but such an arrangement necessitates a certain spacing of the wireless transmitting and receiving stations at each end, and this prevents it from being used on an aeroplane or on shipboard, because in these circumstances the necessary space cannot be obtained. For these a switching device has to be installed at each wireless station, and an operator there has to listen to the conversation and switch over from "send" to "receive," or *vice versa*, at the appropriate instant. This, of course, is not so convenient as the system which permits one subscriber to break in while the other is speaking, and efforts are being made to produce a practicable system which will give these breaking-in facilities between any two wireless stations whatever, whether on land or sea, or in the air. So far, however, such a system has not been produced.

The manner in which the switching system is carried out is shown in Fig. 34. For the sake of clearness only the essential pieces of apparatus have been inserted on this diagram. The full connexions of the transmitting gear are shown in Fig. 33, and those of the receiving gear in various diagrams in the section devoted specially to that portion of a wireless station. The reader should have no difficulty in filling in the omissions for himself.

The three switches 1, 2 and 3, which are moved simultaneously, effect the change from "receive" (R) to "send" (S). When the switches are to "receive," as shown in the diagram, the aerial is joined through switch 1 to the receiver, and the received signals, magnified if necessary, are passed through the transformer R, switch 3 and transformer L to the telephone line.

FIG, 33.

A telephone, joined across the secondary coil of the transformer R, enables the operator at the wireless station to keep in touch with the conversation so as to switch over at the proper moment. When the switches are to "send," and the receiver therefore disconnected from the aerial, the receiver is still affected sufficiently strongly by the waves sent out by the near-by transmitter for the speech to be reproduced in the operator's telephones. He can, therefore, follow the conversation in both directions.

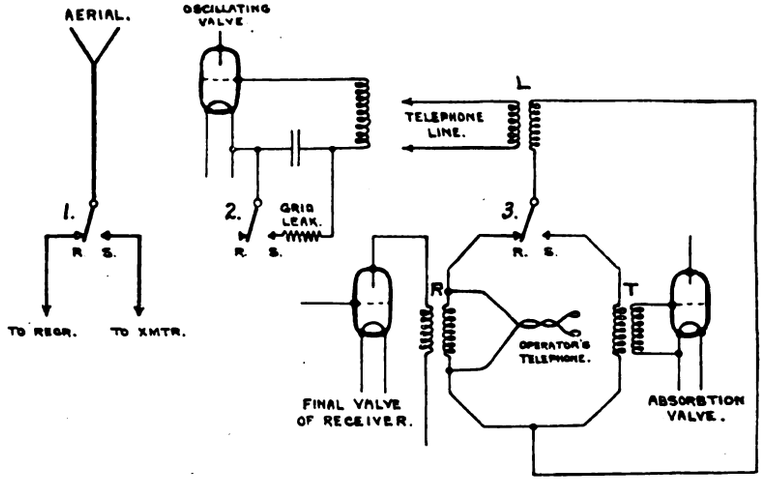


FIG. 34.

The switch 2 in its "receive" position, disconnects the leak round the grid condenser of the oscillating valve of the transmitting set, and therefore, as already explained in connexion with the valve transmitter, prevents oscillations being set up.

When the switches are moved over to "send," switch 1 joins the aerial to the transmitter, switch 2 closes the grid leak and so starts the oscillations, while switch 3 joins the line transformer L to the primary coil of the transformer T. The secondary coil of this transformer is joined to the grid of the absorption valve, if necessary, through a number of speech amplifying valves, as in Fig. 33. Currents coming in over the telephone line can thus vary the potential of the grid of the absorption valve, and so modulate the emitted waves to the correct form to reproduce the speech.

(To be continued.)

PRINCIPLES OF THE FIVE-UNIT SYSTEM.

(NOTES OF THE FIRST LECTURE OF A SERIES TO SUPERVISING OFFICERS IN THE C.T.O. GIVEN BY W. T. COUSINS.)

THE object to be achieved in substituting multiplex systems for Morse working is to fill the line. The output of the Morse is limited to the speed of the slowest operator at either end. The length of the signals and the time taken between them leaves the line idle for a longer period than when in use. Multiplex working makes it possible to fill the line without unduly pressing the operators.

WHEATSTONE.

10 reversals	...	=	1 inch
∴ 1,200 reversals	...	=	10 feet.
But 50 words ...	...	=	10 feet.
∴ 50 words ...	...	=	1,200 reversals.
1 word ...	...	=	24 reversals

BAUDOT.

11 reversals	...	=	1 revolution*
180 revolutions	...	=	1 minute.
∴ 1,980 reversals	...	=	1 minute.
Taking 5 letters + 1 space		=	1 word.

Words for 1 arm ... = $\frac{180}{6}$ = 30 words per minute.

Words on 4 arms ...	...	=	120 per minute.
∴ 120 words ...	...	=	1 minute.
But 1,980 reversals	...	=	1 minute.
∴ 120 words ...	...	=	1,980 reversals.
1 word ...	...	=	16.5 reversals.

1 Wheatstone word : 1 Baudot word :: 24 : 16.5.

Baudot words per minute ... ... = 120

∴ Wheatstone words per minute ... = $120 \times \frac{16.5}{24} = 82.5$

N.B.—Then a line which will work at approximately 85 words per minute Wheatstone duplex, should work 120 words per minute (normal speed) on Baudot quadruple duplex.

On long lines with a repeater in circuit it is the practice to try reversals and old slip before working commences.

If alternate keyboard tappers are depressed on the Baudot, reversals will be sent to line similar to those sent from a Wheatstone transmitter. In the place of running old slip, Morse characters are formed by making certain combinations with the keyboard tappers by means of small rectangular metal blocks. The combination generally used is made by the letters "BL" run together, *e.g.*, — · · · — · · — · · · · — · ·

and twenty longer; also all figures and secondaries.

"CRITICS CONVERTED TO PAYING COMPLIMENTS."

THE following extract (under the above headline) from the *Bradford Daily Argus* furnishes yet another proof, if any be needed, of the great advantage of giving subscribers a practical demonstration of the working of a telephone exchange:

About twenty members of the Bradford and District Chamber of Trade, representing most of the distributive trades, visited the telephone exchange at Nelson Street, Bradford, yesterday, at the busiest time of the day. The visit was the result of some hostile criticism made at the last Council meeting.

Mr. Fred Pickering, J.P., hon. secretary of the Chamber, and Mr. J. J. Booth, the president, introduced the members, who were courteously received by Mr. Lefevre (the Postmaster), Mr. Bates (district manager), Mr. Tinsley (engineer), Mr. Rogers (traffic manager), and Mr. Lawrence (superintendent). All the main departments were visited, and the party was intensely interested in all they saw, and they came away with very much altered opinions of the efficiency of the system so far as Bradford is concerned.

Mr. Booth gave his heartiest thanks to the officials, on behalf of his colleagues; and Mr. Pickering, in supporting, said that only by tradesmen subscribers seeing for themselves could they realise the difficulties and the intricacies of the telephone department.

Messrs. Bates and Tinsley, in reply, said, that if the public subscribers only knew more of inner workings of the exchange, much of the adverse criticism which had recently appeared in the Press would be proved to be based on erroneous conceptions.

Concerning the complaints of overcharging, it was pointed out that many subscribers on investigating would discover that a great many calls were made by members of their staffs which had no connexion at all with business. The girls were so busily employed that it was an impossibility for them to neglect their work, as there were supervisors always moving behind them.

It was also mentioned that the demand for new telephones had been met and reduced by about 90 per cent., and those still waiting were held up for certain equipment not being to hand. The officials anticipated that within two months all demands would be promptly met as they occurred.

The *Bradford Chamber of Trade Journal* makes the following comment:

Whatever may have been the opinions of the members of the deputation prior to this visit of inspection, it is most assuredly safe to state that they came away with much altered views of the wonderful system as seen in operation at a time when the peak load of calls was highest. So far as could be judged the system was being worked with the greatest efficiency, and whatever subscribers may say in coinplaint of over-charges it seemed next to impossible for such to be made. One must not forget, however, that many calls are made by members of staffs of various business houses in the Bradford area who have no authority to use the instruments for their own personal assignations or purposes, and thereby "hangs a tale" probably of a great many calls which business men are being called upon to pay which have no connexion whatever with their businesses. Everyone came away feeling that the afternoon had been most profitably spent.

TELEGRAPHIC MEMORABILIA.

THE closing meeting of the 1921-22 Session of the T. and T. Society, held at the I.E.E., was marked by a deeply interesting paper by Mr. A. B. Hart, and read to a deeply interested audience. The presence of Mr. F. J. Brown, Chairman for the session, was particularly welcome, especially in view of his unavoidable absences across the Atlantic on important national business. Sir Andrew Ogilvie was amongst the comparatively few speakers who were able to contribute to our knowledge of so technical a subject of "Carrier Currents." More than one complimentary remark was heard as the audience dispersed on the sustained interest of Sir Andrew in affairs electrical despite his retirement from public service.

The Annual Report and Balance Sheet for the closing session and the election of the various officers and Committee for the session 1922-23, preceded Mr. Hart's successful contribution to our general knowledge. It is highly satisfactory to place on record an increased membership, an increased balance to be carried forward, and last but not least, the acceptance of the chairmanship for the coming session by Sir Henry Bunbury, who, one can readily believe, is keen to know more intimately something of telegraph and telephone activities other than the cold figures with which his daily task is closely associated.

The annual report of the Post Office Sanatorium Society and Statement of Accounts for the fifteenth year of its existence, which terminated on Dec. 31, 1921, is to hand, and shows a very considerable net increase in its membership and a satisfactory balance sheet for the year under review. No

Digitized by Google

less than 8,112 new members joined during that period, against which must be set 2,912 withdrawals due to deaths, pensions, marriages, &c. Appreciation of certain investments and certain economies have permitted the Treasurer to announce that no less a sum that £14,386 now stands to the credit of the reserve fund. Doubtless, the most satisfactory item is that under "General Results," which states that the Society's efforts have resulted in arresting or materially improving 87.91 per cent. of the tubercular cases treated. Membership is open to all classes of the Post Office services, and the subscription is represented by the lowest valued coin of the realm *per week* !

The Swiss Marconi wireless station was opened near Berne at the end of the month of April, but it is understood that the Swiss Government have no intention of closing down any of the international *wire* telegraph services in consequence.

The *Westminster Gazette* was apparently the first to announce that the Irish Post Office had made arrangements with the Commercial Cable Company, Waterville, and the Marconi Wireless Co., Clifden, to handle Irish traffic for America at Irish stations.

The Imperial Wireless Service (Anglo-Egyptian section) inaugurated on April 24, appears to be working very smoothly, promising well for future developments.

The information comes to hand from a very reliable source that direct telegraphic communication has been established between Russia and Germany, *via* Dvinsk. The *Daily Telegraph* also announces that, "The Council of People's Commissaries has granted a concession for telegraphic communication between India and Europe. Communication will be through Russian territory, and there will be connexion with Turkey, Egypt, Persia, and the Mediterranean countries."

The *Pravda*, Riga, also stated early last month that the Soviet Government had authorised the project of "granting the Indo-European Cable Company a concession of the cable running through the territory of the Soviet Republic linking up with the cables of the above company in other countries.

The Black Sea cable belongs to this company, joining up Odessa and Constantinople, and besides the company has the use of the land cables run from the present Russo-Polish frontier through Odessa, Kertch, and Tiflis to the Russo-Persian frontier."

The report of the Indo Company's Chairman at their 55th Ordinary General Meeting, held a few weeks ago, may therefore be quoted with added interest, although its appearance in the London daily Press appears to have passed without notice. A few extracts from that report will doubtless prove especially informative :—

"The Polish concession was signed some time back. Within the last few days we have been advised by the Russian Department of Posts and Telegraphs that our concession from the Moscow Government was signed. This is, of course, a very important fact, as the concession covers the whole territory traversed by our line, from the Polish frontier on the west to the Persian frontier on the east, transiting various Federated States, who have also approved the concession.

Our concession from Persia is already in existence, and that from the German Government, although not actually signed, owing to international politics, has for a long time been agreed in principle and should offer no difficulty.

The condition of the Company's line is more satisfactory than could perhaps, have been expected.

It is workable for a stretch of over 200 miles north-west of Odessa, whilst east of Odessa a similar state of affairs exists for 300 miles into the Crimea. Beyond the Straits of Kertch the line is in working order between Ekaterinodar and Tiflis. Between Tiflis and Erivan there is a short stretch where the repairs have not yet been completed. The section Erivan-Djoulfa, on the Russo-Persian frontier, has undergone repair and is now in working order, as is also the Company's Persian section, Djoulfa to Teheran.

Further, the Black Sea cable, Odessa-Constantinople, is again in working order, and has already been officially opened by the Soviet Government representatives at Odessa. This cable will, therefore, shortly be able again to carry the classes of traffic formerly dealt with by it, and will, it is hoped, help to re-establish business relations generally with Southern Russia and the Black Sea ports.

The Indo-European Telegraph Department states that their Persian lines are in good order and are available at any moment.

During the last three years we have been straining every nerve to be ready for the reconstruction when the moment arrived. Great quantities of material of every description have been accumulated at suitable bases. The fact that Central Europe has been devastated and laid bare from every point of view has rendered it necessary to provide for our staff and workmen even the ordinary necessaries of life, such as food, clothes, and medical supplies, the latter item in particular being very scarce in parts of Russia.

The most arduous part of our work is, undoubtedly, the section from the German and Polish frontier on the west to the Polish-Russian frontier on the east.

Much of our line on that territory has absolutely disappeared as a separate international line, and where three or four wires were suspended there are now 10 to 20 of all sorts, including telephone wires ; we, therefore, in accord with the Polish Government, arrived at the conclusion that it must be rebuilt in a new location—namely, along the great *chaussees*, or high roads.

Our engineering staff is on the spot, as also the material required, but the work of building a fresh line of some 400 miles will occupy some months.

The constructional work has been elaborated here, in London, and the variety of material and appliances that have been provided is legion ; such things as specially constructed six-wheel lorries for transport of oak poles and other material, a motor-caravan to enable the engineers to live on the spot, cars for travelling from one erecting gang to another, all tools and line tackle—in fact, a hundred and one items."

The Company is evidently now in full possession of 'the political rights-of-way,' and should ere long recover much of the lost ground of the last eight years."

European affairs may thus be said to be gradually disentangling themselves now that 'communications' have begun to re-organise, and as was to have been expected after the great upheaval, to re-orientate.

For example, take the following from a Danish financial source :—

"The Danish Store Nordiske Telegraf Selskab has applied to the Swedish Government for a renewal of the agreement between the two parties, which will expire in about three years from the present time, having been prolonged in 1910 for a period of 15 years. An agreement also exists between the Government of Finland and the Great Northern Telegraph Co. with regard to the telegraphic traffic to the west, and if Sweden were to terminate the contract with the Danish company this would influence the relations between the latter and Finland, because the company would no longer be able to fulfil its contract obligations. Finland and Sweden would then have to arrange their own mutual telegraphic connexions. As a consequence the attitude of the Swedish Government is also of exceptional interest for Finland. Sweden receives a considerable amount in transit taxes, which will be increased when the company's services to Russia and the Far East are resumed. In some circles in Sweden it is desired to become independent of a Danish company, and in this respect there is the example of Norway. But the position of Sweden and Norway in relation to the company is quite different. In Norway the company only owns the cables between Norway and England, but no transit traffic proceeds through Norway."

The fact too that the Great Northern Telegraph Coy. of Denmark, which has considerable interests in Eastern as well as Western Europe, will announce a dividend of 22 per cent. at their General Meeting to be held at Copenhagen, on the 30th of the present month, is proof positive that there is likely to be some liveliness in matters telegraphic during the next year or two. With the Eastern Telegraph Company improving its cable service, the Indo, the Northern and the Imperial services all alive to the possibilities of Eastern and Far Eastern traffic there should be some strenuous work for telegraph canvassers !

From Vienna we learn that an Austrian Wireless company has been founded, capitalised by the Vienna Bankverein and the Siemens-Schuckert Telefunken companies, for enlarging all the existing Austrian stations and thus permitting direct wireless services with all Europe and America. Such is the ambitious scheme !

The amalgamation of the three chief German cable companies, the *Deutsche Atlantische*, the *Deutsche Sud Amerikanische* and the *Ost Europaische* is now a *fait accompli*, while the *Ueberseeverkehr* corporation of Berlin reports an increase in the traffic from the Wireless stations at Nauen and Eilvese in 1921, particularly with the United States and European countries. This corporation it will be recalled, has a certain community of interests with the Radio Corporation, as also with Transradio Argentina.

Consider the following items, telegraphic and telephonic, wire and wireless, land and cable, and say readers all if in telegraphic and telephonic history there was ever before so much movement in the province of our craft :

That there is a scheme on foot for controlling all wireless stations built or to be built on Mexican territory for the next fifty years ;

That a wireless telephonic service has been opened between Pekin and Tientsin ;

That a long-distance telephone circuit will shortly be installed between Shanghai and Nanking ;

That the lonely island of Tristan da Cunha is to be rendered less lonely by the installation of a wireless installation ;

That the preparations for the extension of the Bergen wireless telephone service will be completed by June ;

That it is understood that an agreement has been reached between the Finnish and Swedish telephone administrations, under which a nine circuit cable is to be laid between Helsingfors and Stockholm for service between the two countries ;

That the Cuba Submarine Telegraph Co. has laid a new cable section between Cape Cruz, and Santiago, and completely repaired the Cienfuegos-Santiago 1905 cable, and *inter alia* has also declared a dividend of 10 per cent ; and,

That the French telegraph authorities recently established a temporary direct telegraph circuit from Paris to Biskra Algeria, a distance of 1,562 miles.

Mr. W. L. Griffith has been appointed by the Canadian Government to succeed Sir George Perley as the Dominions representative on the Pacific Cable Board.

On the 2nd of last month there passed away in the person of Mr. H. Sissons a personality which simply by daily acts of helpfulness, and a constant spirit of courtesy endeared himself to all with whom he came in contact, officially or unofficially. Originally on the staff of the Submarine Telegraph Company, he was transferred to the Government service in 1889, remaining in the Cable

Room, C.T.O., for several years. Eventually transferred to the Engineer-in-Chief's department he retired upon reaching the age-limit in April of last year, apparently with every prospect of a lengthy period of retirement. The respectful sympathy of all his old colleagues is tendered to his bereaved wife and family, together with the sincerest expression of appreciation of a fine character.

An interesting item of the tour of the King and Queen in Belgium was the establishment of direct telegraphic communication between Zeebrugge Quai and London C.T.O., during the time their majesties visited the celebrated Mole and its heroic associations.

The visit of the Duke of York to the C.T.O., London, though an official one, largely partook of that homeliness and freedom with which we have become accustomed to associate the royal family. The young duke was unfeignedly interested in all that he saw, and witnessed the receipt of several telegraphic messages specially addressed to his highness, from countries as far apart as Australia, Canada, France, and Belgium, the Director of the Czecho-Slovakian Telegraphs forwarding a cordial note from Praha, the capital, with which city the C.T.O. is in daily direct communication by wire *via* Germany.

Transition Periods.—"In an age of transition it is the direction of the thoughts and aims of men which constitutes the radical difference or agreement between them rather than the exact distance that each may have travelled on the same road."—*Seebohm* on *Thomas More.*

CORRESPONDENCE.

ECONOMY IN LINE TIME AND MY TIME.

THE KR LAW AND THE TR LAW.

TO THE EDITOR OF THE "TELEGRAPH AND TELEPHONE JOURNAL."

SIR,—It would save my time and your readers' time, as well as line time, if some people would stop writing nonsense about the Multiplex. In your December issue, Mr. Teare trumpeted the alleged advantages of the Western Electric Multiplex, and now Mr. Pratley urges the alleged advantages of the Siemens' automatic system. I pointed out in reply to Mr. Teare that the Western Electric had merely adopted the Picard method of correction from the message signals, which Picard had applied to the Baudot Multiplex working across the Mediterranean years before the Western Electric Company had ever thought of Multiplex, and that this Picard method was available for any multiplex system. To attribute special merit to the Western Electric Multiplex for economy of line time through the adoption of the Picard-Baudot device is obviously absurd. Actually I was the first to propose correction from the message signals for the Multiplex as far back as 1903, and when the conditions require it, I provide this economy of 20 segments instead of 22 on the distributor in a much simpler way than the Western Electric or Picard method.

Turning now to the claims of Mr. Pratley, in favour of the Siemens' automatic system, he contends that in order to gain full advantage of the saving of line time by the adoption of correction from the message signals, it would be necessary to have various speeds for various lines depending on the "KR values," that is to say, on the varying length of the lines. Mr. Pratley asserts that varying speeds of operation on the Multiplex would be "chaotic." The facts are against Mr. Pratley. The Western Union has extended the Multiplex with tape transmission all over the United States, and has a variety of speeds ranging from 30 to 60 words a minute per channel, not only without "chaos," but with very considerable economy. With keyboard perforators and tape transmission there is no difficulty whatever in suiting the speed of operation of the Multiplex to the line and the traffic. Actually in Great Britain the lines are so short and their carrying capacity in most cases so much beyond traffic requirements that there is no pressing need to vary the speed, and it is only a question of time for the standard rate of transmission on all Multiplex trunk lines in Great Britain to be raised to 60 words a minute per channel. The Western Union has found this speed profitable. Profit is all-powerful. It is like the grey cloud of necessity to which even the gods must bow, and sooner or later profit will compel the adoption of the 60-word rate (two messages a minute per channel), on the Multiplex lines in Great Britain. Mr. Pratley forgets also that on the Multiplex not only can the speed per channel be varied, but also the number of channels. It is a fact proved beyond question by Western Union experience that the speed of the Multiplex can be adapted as closely as desired to the length of line and the load of traffic. It is tape transmission that gives flexibility of speed both to the Multiplex and the Automatic. In this respect the tape transmission Multiplex is equal to any automatic system, and has the advantage over any automatic system of far higher traffic-carrying capacity. On the Murray Multiplex installation on the *Scotsman* private wire from London to Edinburgh (400 miles), 60 words a minute per channel on four channels from London to Edinburgh presents no difficulty. That is 240 words a minute directly and instantly printed from the line signals in page form. No automatic system can do that or ever hope to do it. Physical and commercial limitations make it impossible. Even six channels at 60 words a minute are not the limit for the Multiplex, and in coming years, when traffic presses, a speed of 360 words a minute in each direction on busy Multiplex trunk circuits in Great Britain will be one of the commonplaces of telegraph practice, and it will not be any automatic system, German or otherwise, that will do it.

In view of the facts that I have given in this letter, how absurd is Mr. Pratley's statement that it is necessary "to have recourse to an automatic system such as the Siemens-Halske and others, wherein the transmitter may be rotated at a speed determined by the retardation of the line, and the mechanical performance of the receiving apparatus." The modern tape transmitting Multiplex has all the facility of automatic systems for speed variation, and "the mechanical performance of the receiving apparatus" on the Multiplex is, and always will be, far beyond the capacity of any automatic system. Mr. Pratley says: "This advantage of the automatic principle over the Multiplex is not generally touched upon." Naturally it is not touched upon, because it is not true

Mr. Pratley's calculations are very interesting, but they are based on the assumption of a fixed speed for the Multiplex of 180 revolutions per minute (30 words a minute per channel) which is ridiculous. Mr. Pratley should take a trip to America and see what the Western Union is doing in a country where, on account of the great distances, "the KR values" have real importance. The Western Union is working the Multiplex quadruple duplex between New York and San Francisco, 3,300 miles, or eight times the distance from London to Edinburgh. In Great Britain the distances are so small that in most cases the KR values are negligible when the traffic load is considered. If the limiting speed of the line is 200 words a minute and the traffic only requires 100 words a minute, we need not worry about the KR. In fact KR. in Great Britain is mostly TR—that is to say, Tommy Rot—and it is on the TR law, and not the KR law that Mr. Pratley's elaborate calculations are based.

One word more. Mr. Pratley credits Mr. H. H. Harrison with the observation that a distributor is a time divider. It was I who pointed out in my pre-war advertisements in the TELEGRAPH AND TELEPHONE JOURNAL that distributors are "clocks or time dividers," running about 15,000 times faster than ordinary clocks. I shall have to apply to the TELEGRAPH AND TELEPHONE JOURNAL for a reduction of my advertising rates on the ground that Mr. Pratley does not read my advertisements.—Yours truly,

DONALD MURRAY.

THE TYRANNY OF TELESCOPES.

THE British Chaplain and Vice-Consul at Gothenburg told a Manchester audience (according to the *Manchester Evening News*) that owing principally to its water-power the entire country of Sweden was electrified from end to end. He did not say, continues that journal, whether or not the tyranny of telescopes was as great and as terrifying as it is here.

What is this tyranny of telescopes to which our contemporary darkly alludes?

O ye, in happy innocency lulled,
What reck ye of the tyranny which stalks
About us, and the easy Briton's dulled
Perception baulks?

Draw near, and learn that, unsuspect, exists
A fearsome Tyranny of Telescopes,
More dread than that of Prohibitionists,
Kaisers or Popes.

Who wields this tyranny? To what dark end?
I cannot say, but seem to understand
Some Hidden Eye, replacing our old friend,
The Hidden Hand.

Say that you bury some respected aunt
(And bury her at Lord's or Kempton Park),
The Telescope may tell—and you may want
A berth as clerk.

Or, say you are a servant of the State,
The Telescope, it may be, day and night
Watches for your Dead Hand, which soon or late
'Twill drag to light.

Or, if your bonus dwindle till it cease,
The Telescope may serve to magnify
Your salary—but not, alas, increase
Its power to buy.

Perchance its terrors for small game it saves,
As when plump maidens on some sunlit strand,
Hiding but half their charms beneath the waves,
It spies upon—and then an edict craves
"Mixed bathing banned."

W. H. G.

THE BAUDOT—XXXIII.

By J. J. T.

The Moderator.—As we know, the moderator is a speed governor of a rough and ready type compared with that of the regulator of the Baudot distributor. The care of this portion of the apparatus and its adjustment are very simple. It is liable to collect an abnormal amount of dust, and of this it should be regularly freed. The brake with which it is provided and which controls the moderator by damping down its speed by contact with the friction plate, should be periodically examined and kept well supplied with tow. Definite speed values are obtained by bringing more or less spring spirals into play for lower or higher speeds respectively. It is generally arranged that the moderator should rotate at about 1 per cent. faster than the distributor, and in this country is so adjusted that the *electro*-brake is pulled up to the speed of the distributor once every revolution.

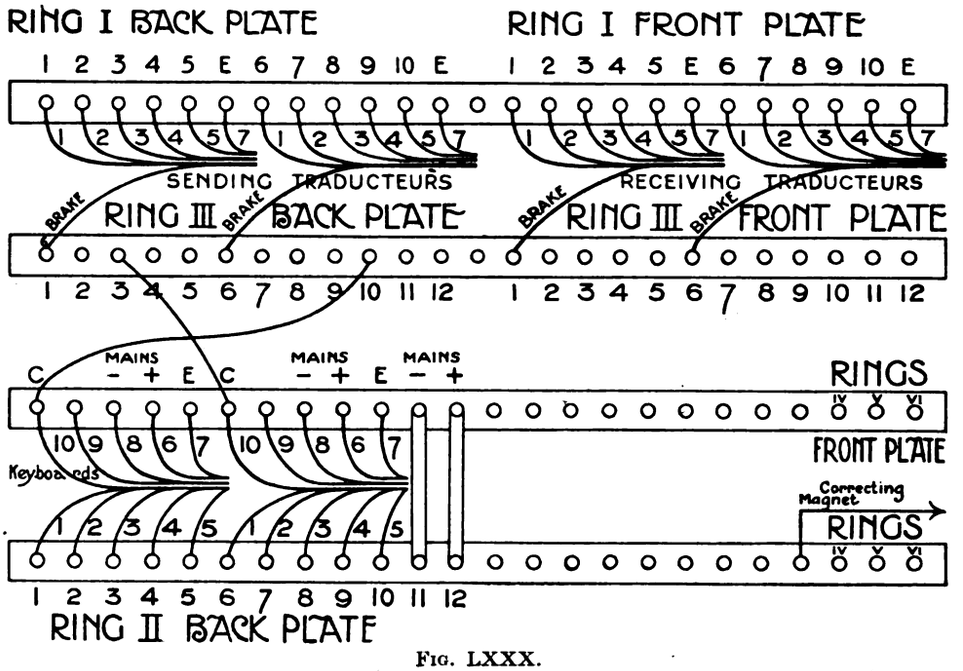

FIG. LXXX.

In turning to what may be said to be the more modern developments of Baudot, no difficulty should be found in following the means by which the Duplex system is applied to Baudot Multiplex telegraphy. In doing this, no simpler method is known to the writer than that diagrammatised by Lt.-Col. A. C. Booth, who, as is well known, was responsible for adapting the system in the British Isles.

Fig. LXXIX gives this very clearly. The distributor is of the double-plate type, a common axle running through each plate and carrying the respective brush carriers, the back plate A being devoted to transmission, and the front plate B to reception. In this plan the brake and cadence rings are not shown, only the essential receiving rings 4 and 1, and the transmitting rings 2 and 5, together with the local record or control rings 1 and 4, being represented.

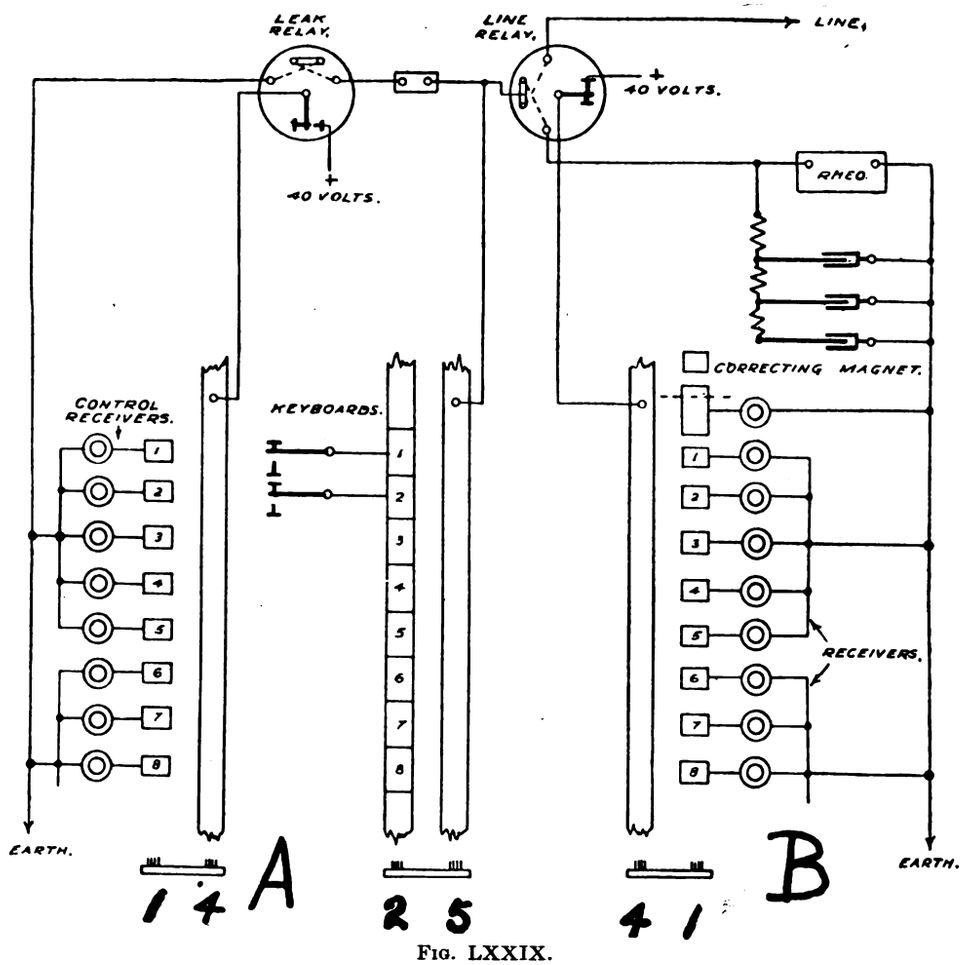

FIG. LXXIX.

The simplicity of the arrangement is striking. The Duplex system here chosen is the Differential, although Bridge is, of course, not excluded. Ring 5 Back Plate is joined direct to the split of the relay instead of to Line as in Simplex.

Taking the simplest form of Baudot Duplex, the Double, only 12 segments are required, 10 for the keys of two keyboards, and two for the correcting currents, as there is not need for making any allowance for propagation or retardation.

Similarly, a Triple Duplex Distributor would have 17 segments, a Quadruple Duplex 22 segments, and so on.

Fig. LXXX represents the connexion box, to which as in all Baudots, the various parts of the apparatus are joined. It consists of four wooden strips suitably enclosed. The connexions from the distributor plates, batteries, &c., are brought to the back of the respective strips and attached to metal plugs or screws, which pass through to the front of the strips. Here the relative connexions in their various cables are brought from the keyboard keys, cadences, brakes, &c., and are strapped on as desired. The connexion box here shown is that fitted for a *Double* Duplex Baudot. Rings 2 and 5 of the Front Plate are not in use.

(To be continued.)

RETIREMENT OF SIR WILLIAM NOBLE, ENGINEER-IN-CHIEF OF THE POST OFFICE.

ON the last day of May Sir William Noble retires from the chair of the Engineer-in-Chief at the G.P.O., and carries with him the best wishes of the whole engineering staff.

Beginning his official career in 1877 as a telegraphist in Aberdeen, he was not content to be a manipulator all his life. He acquired a proficient knowledge of Pitman's shorthand in a phenomenally short time, an art which has stood him in good stead. He also devoted his spare time to studying English, mathematics, the principles of electricity and magnetism and other kindred sciences. He won medals in both the ordinary and honours grades in the City and Guilds examinations in telegraphy and telephony, and was appointed lecturer in those subjects at Gordon's College, Aberdeen.

SIR WILLIAM NOBLE.

His success attracted attention throughout the service, and in 1893, after a short training in routine procedure in the Engineering Department in Edinburgh, he was appointed Engineer in charge of the Aberdeen section. Four years later he was promoted to a First-Class Engineership at Headquarters, and in 1900 he was appointed Second-Class Technical Officer. The Post Office had just about that time undertaken the task of installing a telephone system in London, and in 1901, Mr. Noble was selected to act as Assistant Superintending Engineer in the newly-created Central Metropolitan District. He had a large share in the work of the "telephoning of London," a big engineering undertaking, of the magnitude of which the general public has no real conception, and of which even the technical press had but vague notions at the time.

In 1905 he was recalled to Headquarters as First-Class Staff Engineer and placed in charge of the telegraph section, which included wireless telegraphs in those days, the operations of radio work having not then reached the magnitude and importance now attained. The comparative seclusion of a section at Headquarters did not act as a sedative to his energy. It was during this period that central battery working was introduced, an improvement which resulted in large savings in apparatus and battery materials. He also vigorously promoted the development of machine sending and printing telegraphy. In 1907 he returned to the London district as Superintending Engineer of the Central Area. After improving and consolidating the organisation of that district he recommended the amalgamation of the three London districts into one, in order to reduce the overhead charges and to simplify the transfer of the National Telephone Company's system and staff to State control. The recommendation was not accepted at the time, but after the transfer two districts were formed out of three, and eventually his original proposals were adopted and a single London Engineering District covering the entire area came into being.

During the years in which he held the post of Superintending Engineer, Sir William was called upon to serve on many departmental committees. For five years he was Chairman of the Factory Works Committee. He, in conjunction with Mr. Sinnott, was responsible for the present system of joint examination, which deals with the examination and repair of all apparatus used by the Department and which saves annually many thousand pounds worth of valuable plant and puts the recovered apparatus into sound revenue-earning condition on the most economical cost basis. He was a member of the Superintending Engineers' Committee, the Underground Railway Committee, and the Main Factories Committee, the last named having as its Chairman the then Assistant Postmaster-General, Captain Norton, now Lord Rathcreedan. Sir William was also one of the three members of an advisory board entrusted with the task of selecting men for promotion to engineering executive rank, and a member of the Selecting Committee for higher posts on the clerical side. Prior to the transfer of the National Telephone Company, he was appointed engineering representative on the Staff Transfer Committee, set up for the purpose of grading into existing Post Office classes the members of the Company's staff. All these special duties on staff work gave Sir William an excellent opportunity of becoming acquainted with a great number of the officers of all ranks, and the information was valuable in handling the staff and in the making of promotions.

In 1912 Sir William was appointed Assistant Engineer-in-Chief. The engineering staff by the transfer of the Company had increased threefold, and the new Assistant immediately set himself to organise the combined staffs into a homogeneous whole. His knowledge of the Company's men acquired during his close association with them in the London District and in his work on the Staff Transfer Committee was invaluable in this connexion, and the amalgamation of the two staffs was accomplished with the minimum of complaint on both sides. Owing to the financial position of the Company and their terms of tenure, the development of the country from a telephone point of view had fallen behind and there was a tremendous leeway to make up. The engineering department fully realised its responsibilities, and the next two years were years of great activity. New exchanges were installed everywhere, underground schemes were provided in almost every industrial centre, obsolete lines and plant had to be recovered, and a vast network of main underground trunks was planned and commenced. In spite of the complaints in the Press about a deterioration in the service, owing, it was said, to the dead hand of the State having been laid on a flourishing industry, the efficiency of the service improved steadily; the time of answering calls was gradually reduced, the number of false and interrupted connexions was diminished and the delay in trunk calls was being effectively eliminated. It is not too much to say that but for the war the telephone service in this country would by this time have been equal to the best in the world.

For his services in connexion with the Signals, R.E., during the War, the King of the Belgians recognised and honoured the subject of our sketch by creating him a Chevalier de l'Ordre de la Couronne for "constant and generous help" during the war.

In 1919 Sir William Slingo retired and was succeeded by Mr. Noble. The appointment was a popular one with the staff, who recognised in their new Chief a man, who, while he had the reputation of being a hard worker himself and looked for the same standard in others, was extremely fair. His services were recognised by the King in 1920 by the conferment of knighthood, an honour which came to him earlier than to any of his predecessors in office. The staff on that occasion acknowledged the honour by presenting Sir William with an illuminated address, signed personally by about 2,000 members from all over the country.

REVIEWS

"Marine Wireless Pocket Book." By W. H. Marchant. Published by Sir Isaac Pitman & Sons, Ltd. pp. vii.+180. Price 6s. net.

This is a book small enough to go easily into the pocket, but which contains in tabloid form practically everything which the ship's wireless operator ought to know. Primary and secondary batteries, generating plant, the various types of transmitting and receiving gear, manufactured by the Marconi Co., Radio Communication Co., and Telefunken, three-electrode valves, and the adjustment and testing of apparatus are all dealt with briefly, but in sufficient detail for the notes to be of great assistance as *aides memoires* to a man who has previously studied the subject, but who, perhaps is beginning to get somewhat rusty on certain points.

In addition, an explanation of the use of logarithms, tables of logarithms and trigonometrical functions, and notes on electrical units and symbols used in diagrams of connexion are given. The book concludes with the licensing regulations for W/T stations, and a collection of miscellaneous information useful to the wireless telegraphist.

It is well printed on good paper and strongly bound, and should prove useful as a handy book of reference for men who are compelled by the nature of their work to keep down to the absolute minimum the amount of baggage which they are able to take about with them.

"Model Questions and Answers on the Thermionic Valve." By Clifford Jones. Published by James Munro & Co., Glasgow. pp. 44.

The thermionic valve is the foundation stone on which all modern wireless telegraphy is based, and a knowledge of the principles of its action and of the various arrangements in which it is employed is essential for anyone connected in any way with practical wireless matters.

The small book under review is designed to provide elementary students, especially those working for the Postmaster-General's certificate, with the means of testing themselves, and of making sure that they really *know* their subject, instead of merely having a hazy idea that they have read a lot about it.

There are 160 questions covering the whole field in a simple and non-mathematical manner, and any student who conscientiously worked through them, and made sure that he understood the answers could be quite certain that he had a thorough grip of the principles of the subject and need not fear any questions with which he might be faced in his examination.

The
Telegraph and Telephone Journal.

PUBLISHED MONTHLY IN THE INTERESTS OF THE TELEGRAPH AND TELEPHONE SERVICE, UNDER THE PATRONAGE OF THE POSTMASTER-GENERAL.

Editing and Organising Committee - - - J. STUART JONES. JOHN LEE. J. J. TYRRELL. W. A. VALENTINE. J. W. WISSENDEN.

Managing Editor - - W. H. GUNSTON.

NOTICES.

As the object of the JOURNAL *is the interchange of information on all subjects affecting the Telegraph and Telephone Service, the Managing Editor will be glad to consider contributions, and all communications together with photographs, diagrams, or other illustrations, should be addressed to him at G.P.O. North, London, E.C.1. The Managing Editor will not be responsible for any manuscripts which he finds himself unable to use, but he will take the utmost care to return such manuscripts as promptly as possible. Photographs illustrating accepted articles will be returned if desired.*

VOL. VIII. JUNE, 1922. No. 87.

SIR WILLIAM NOBLE.

THERE is one characteristic of Scotsmen which is a source of unfailing delight to other nationalities. It is the delight which Scotsmen take in telling stories against themselves. Sir William Noble had this amiable weakness (or amiable strength) in an extreme degree. It is put in the first place here largely because it is significant of something more than the mere recounting of Scotch stories. The value of Scotch stories to civilisation is enormous, but in Sir William's case it indicated the value of a perspective which could see everything sympathetically, which could look from varying points of view, which was never bound by tradition or convention or habit of mind. He is a humanist in the strictest sense of the word, in that to him the worth of life is after all a human worth. Day by day he dealt with affairs which are mysteries to most of us, more mysterious than ever when put in the form of mathematical formulæ, perplexing even in the more or less plain language of scientific terms, but he never forgot for one moment the human values of all those whom he directed and led. He is gifted with an insight into character, with a measurement of particular capacities, which is a rare gift.

There is poetic romance in the idea of a man who has gone right through the service from the bottom to the top. Later ideas of the science of management have led to some controversy on this subject, and there are those who would say that a manager should be trained for management, for administration, from his youth up. This burning controversy need not be touched in this case, but it is wise for all that to protest against the false dichotomy which can only see the two cases, those who reach the top from below and those who are, so to speak, born into the purple. There are reasons to think that a third class does exist —those who have risen from below and possess qualities of leadership, of thought and of insight, which have been quickened and sharpened and broadened in the university of actual affairs. At least Sir William Noble's colleagues can say this of him that it is not merely because he has gone through the mill and reached the top that they have the highest respect for him, but because he has gone through the mill and reached the top and evinced the capacities and qualities which everyone regard as essential for him who holds the foremost place. He was proud of his department; he fought strenuously throughout on its behalf, and if in so doing he ran the risk of a few blows and some little opposition, these did not come from men who respected him the less. He gained the respect and gratitude of the staff for the defence which he put up from time to time of the telephone system, and he did this through a period of heavy pressure and constant occupation with various committees and conferences, in addition to his ordinary day-by-day work. To some of us having frames less virile and nerves more ready to tension, his physical capacities were a constant amazement; it was a part of a general adaptability which is given to but few of us.

In another place the fuller story of his life is given. This is an appreciation at the moment of his retirement. He drops out of the Service, let us say, at a fortunate moment. The winds of criticism are quieted and the storms of opposition have been stilled. He sees the Services, which have been so much to him in his long official career, becoming almost popular in the public eye. It may not be supposed that the sunshine and calm in which he leaves our vast enterprise will continue always. There are alternations of storm and calm in official life as difficult to explain as the changes of weather are to the meteorologist or the trade cycles to the economist. For him who lays down the office of Engineer-in-Chief we do not wish a calm and a quiet and a restful leisure. Sir William Noble could hardly tolerate anything but activity, anything but zest and, indeed, we might almost say, anything but conflict. Rumour has suggested that he chooses a career of angry controversy, of posters on the wall, of heckling, of violent recriminations. We who wait in the calm, the comparative calm, in which he has left us, wish him, in whatever new career he takes upon himself, the joy of human fellowship, the gladness of mutual helpfulness and a continuance of the sense of achievement which are his to-day. He has left a mark on our Service, and that is a proud thing. He has left a standard of fair dealing and a tradition of loyalty, which are precious things for all of us. and not the least to those of us who, though we have differed from him at times in the past, have always differed from him with the ready recognition of his unselfishness of motive and of his loftiness of aim.

WIRELESS BROADCASTING.

MANY references have appeared recently in the public press as regards the extent to which wireless facilities are used in the United States for broadcasting music and information of general interest to the community, and our readers are doubtless aware from the same sources that the number of amateur receiving sets in the United States is between 500,000 and 600,000 (some say a million) as compared with between 8,000 and 9,000 in this country. There is no doubt that America with its larger distances offers special scope for wireless distribution of information which would otherwise not be available in scattered districts; and there is also an opening in this country for a somewhat similar service, though possibly to a lesser extent.

Digitized by Google

Some of the American experts who have had experience of the results of broadcasting are of opinion that the future of the wireless services lies entirely in that direction, and that wireless as a means of individual communication between fixed points is in general a back number and is never likely to be a serious rival to the cable and land-line telegraphs and telephones. Without accepting this extreme view in its entirety, it seems to us that the wireless service is even now unrivalled as a means of simultaneously distributing matter to an unlimited number of stations. Those of us whose activities have been confined to line telegraphy or telephony can hardly realise at first that a wireless station, like that at Leafield, near Oxford, can send out a message on high power which can be and is picked up by any number of receiving stations near and far, and is characteristically addressed to C.Q. (all stations).

It is therefore of considerable interest to us to learn that after consulting the Imperial Communications Committee, the Government have accepted the view that a scheme of "broadcasting" by wireless should be adopted, and have agreed as an experiment to permit the firms manufacturing wireless equipments to broadcast musical instruction and entertaining matter for reception by the public by wireless telephony with a power of 1½ K.W. (valve input) from 5 p.m. until 11 p.m. on week-days (British legal time) and all day on Sundays at various centres throughout the country.

The manufacturing companies have received the news of this concession with enthusiasm, and small wonder, for they will no doubt glean additional kudos from the sale of additional receiving apparatus and the increased sales will lend a useful fillip to the trade. But by far the greater advantage will be reaped by those who, residing far from the madding crowd, have yet a lingering desire for music and the other light and harmless amusements of civilisation, a desire which they have not hitherto been able to satisfy. Just fancy! Any time and anywhere to be able to tune in on 400 metres and to hear Clara Butt or Harry Lauder, or to learn what weather we may expect to-morrow, or why yesterday's forecast was falsified! And it does not matter whether the snow is inches deep outside or whether it is blowing "great guns," the service functions just the same while each member of the audience enjoys the comfort of his own fireside.

HIC ET UBIQUE.

Mr. F. ADDEY, Assistant Inspector of Wireless Telegraphy at Headquarters, leaves at the beginning of this month to take charge of the high-power Post Office Wireless Station at Abu Zabal, Cairo. Our best wishes go with him. Mr. Addey is well known to our readers as the contributor of the series of articles on "Modern Wireless Telegraphy and Telephony," which is still running, and has acted in the capacity of reviewer for the *Journal* of works on radiotelegraphic and other technical subjects.

IMPORTANT telephone developments are projected during the current financial year. £9,500,000 is to be expended on these works, £2,230,000 on trunk lines, £3,500,000 on subscribers' and junction lines, and £2,250,000 on new exchanges and extensions to existing exchanges. The main underground London-Edinburgh trunk route will be completed by an extension from Leeds to Edinburgh *via* Darlington and Jedburgh, and that from Birmingham to Bristol by the Worcester-Bristol section. Amongst other important underground routes to be put in hand are the London-Southend, Manchester-Preston, Preston-Lancaster, Colchester-Ipswich, and Edinburgh-Kirkcaldy lines. Automatic exchanges are to be installed at Southampton, Gloucester, Swansea, Sheffield, Shrewsbury, Fleetwood, Dundee and Kirkcaldy. The developments of the London area include the establishment of new exchanges at Tottenham, Kilburn, Nunhead, Barnet, Eltham, Southall, Hounslow, Woodford, Wallington, Addiscombe and Thornton Heath, while a new exchange called Monument will be opened in Central London.

THE summary of written complaints for the month of March shows some results which would astonish the telephone-using public if they grasped their full import. The number of such complaints per 1,000 originating calls was: for the provinces 0.073 local, 0.069 trunk calls; for London 0.050 local, 0.084 trunk; Great Britain and Northern Ireland 0.063 local, 0.071 trunk. That is to say that in London one local call in 20,000 was the subject of a written complaint.

THE following is an extract from an article by Mr. Dudley Ward in the *Manchester Guardian* on "The Foreign Exchange Market in London," referring to the enormously increased use of the telephone and its influence on the market:—

> It is perhaps this almost exclusive use of the telephone which is the chief characteristic of the London market in its present form, distinguishing it not only from pre-war practice, but also from most foreign centres, where exchange business is still carried out to a large, but perhaps decreasing extent, on the Bourse. Since the final abolition, at the end of 1920, of the meetings in the Royal Exchange the London market has no central meeting place, and dealers, in the course of business, never see each other in the flesh. The market is nothing more than a close network of telephones connecting up dealers and brokers, and spreading out further by telephone to the provinces and to the nearer Continental centres and by cable to all the rest of the world. The acceleration of business by this means is enormous. At any one moment London may be connected up with Paris and Brussels by 'phone, Paris with Zurich and Spain, Zurich again with Vienna, and Brussels with Amsterdam, Cologne and even with Berlin, so that the levelling up of rates with the whole Continent need be the work only of a few minutes. Cable business, particularly through London, has been accelerated to an almost equal extent, so that a wire may be sent out and an answer received from New York within eight minutes, an advantage which makes London the clearing-house for America's exchange business with the Continent.

Telephone Talk, published at Vancouver, B.C., states that the telephonic development of British Columbia is now 14.8 per 100 inhabitants. Canada as a whole is 10.4 per 100, and the United States 11.4. Unfortunately in quoting disparaging figures for Europe, some very stale statistics are apparently used. Great Britain is shown as having a development of 1.9 instead of 2.2., Holland as 1.8 instead of 2.4, Germany 2.3 instead of 3, Switzerland 3 instead of 4, Sweden 6.4 instead of 7, and Denmark 7.3 instead of 8.7.

"To what base uses, &c." The Queen of Sheba is synonymous with "the William Fox Love Spectacle," in the *Baltimore Sun*. The bill for the telephoning alone of the film, we are told, was 18,000 dollars. Fifty captains were stationed to direct the various squads of "mob," and soldiers under orders from headquarters. Twenty-five "trouble" men were patching and laying wires and instruments for two months, and eight operators worked at the exchange on the field. Perhaps not even the supernatural hosts which Solomon, according to the Koran, arrayed against her could have astonished the Queen more than the wonders of cinematography and telephony, and certainly nothing so much as an American film producer's ideas of oriental manners and morals.

A DISCUSSION with a "high postal official" on wireless developments gave a provincial journalist to understand "that there is a good prospect of the regulations being relaxed in favour of amateur senders, but their efforts will be restricted to a small power of wave-length. A length of 24 watts is suggested as being adequate, but it was pointed out to me that a power of this dimension has been known to reach Australia from this country, while on other occasions a wave-length of half-a-million watts has failed."

Such a champion mixer is lost in journalism; his sphere of activity is surely cocktails.

WOMEN IN THE CIVIL SERVICE*.

BY MISS L. M. HERRING (*Central Telegraph Office*).

IT is customary in these days to find that a considerable amount of time is spent on discussions concerning women—as they were—as they are—and (to the invariable confusion of all disputants)—as they should be. Therefore the title of this paper does not now excite comment. It appeals to all rational thinkers as a perfectly natural subject for discussion. This fact of itself must call for satisfaction from our feminists, because, while unquestionably many factors have contributed towards the building up of the present position, it is at least certain, that interest in the psychology and aspirations of women has achieved sufficient dimensions to ensure that the historians of the future will devote a measure of their time to a comprehensive survey of women's progress.

Students desirous of obtaining a true and complete picture of the women of past centuries have found very meagre mention in the old records upon which to base their conclusions. Extravagant, and even ludicrous appraisements have emanated from the poets and songsters of all ages, but while their art was to be admired, and often exquisite in its beauty, rarely can it be said that their pourtrayal of women has been convincing as a record of her in actuality.

The question under discussion—Women as Civil Servants—whilst seemingly very simple, and to outsiders perhaps, scarcely controversial—being to them a record merely of a *fait accompli*, is to those intimately concerned one that they regard—maybe hopefully—possibly despairingly, but of necessity, with a continually increasing interest.

In a book of to-day, one of those novels written with the aid of an unusually powerful imagination, and telling of altogether improbable feats in an utterly impossible world, the author gives his hero power to see into other men's minds, to know as though they were written all their thoughts. As a matter of interest, the hero could be expected to find such an occupation more exciting than the destiny ordinarily accorded him in a book of this type. Could this most useful power be extended to ordinary people like ourselves, the result would be amusing, astonishing and distinctly instructive.

Civil Servants are, in the main, a reserved class of people, preserving an outward calm and geniality, which a peep at their thoughts would show to be merely an exterior polish or covering assumed as a protection.

It is within the memory of many women, how elderly gentlemen and, curiously enough, even some elderly ladies, held up their hands in horror at the thought of the Woman Member of Parliament. Some possibly are still living who believe that the prestige of the House of Commons has suffered a blow from which it will never recover. But modern men and women find such ideas simply amusing. Yet it is probable that an exercise of that mind-reading power would show still surviving among certain heads of Departments a feeling of sadness and vague alarm at the sight of well-dressed and alert looking women preparing to assist in the work of their Departments. Such minds are very easy to read, and, such is often the inconsistency and waywardness of the male mind, that thoughts subtly change and maybe they are entirely forgotten and the once irreconcilables become sturdy supporters of the extended employment of women.

It would be still more interesting to look into the mind of the young male Civil Servant. His views would probably be contradictory. As a good brother he would like to see his sister in as comfortable and secure a job as his own, yet he would want to shut her out from competition with himself or his friends. One can almost see him in silent consternation at the thought of her possibly beating him in a competitive examination! He would find too, that all sorts of little prejudices—legacies left him by by-gone generations—would prompt him to desire to choose what work women should do, and what should be reserved for him alone—he would be tempted to speak disparagingly of the work performed by women, and again, being on the whole an honest fair-minded boy, he would be vaguely discontented with such an attitude, and would probably conclude by putting the blame on women for "pushing in where they were not wanted," marrying one of them, and being very thankful that his female relatives were able to command positions which enabled them to be dependent only on themselves.

To women, the point of view is different; years ago she had a more limited choice; for her there was marriage, with its attendant advantages and disadvantages, celibacy without independence, and celibacy with an unenviable position as governess or domestic servant. Slowly she was forced by economic necessity, to press her way into other occupations, and to-day we find that women, having reached a permanent footing in the world of labour, are now of their own vigour and proud courage fighting their way to obtain recognition of the right to enter any occupation (with equal status) that exists or will exist in the future. The modern mother strives to equip her girls to battle through life for themselves, and this new spirit of independence in women is one of the most convincing proofs of the stamina, vitality and limitless possibilities of the human race.

To present an adequate account of the services already performed by women in the Civil Service is no easy task. The difficulties centre round the variety of work—necessitating a discrimination and explanation which perforce must be given at some length, and which involve the consideration of problems inseparable from the employment of women, not only in the Service but in all professions and industries. Methods of recruitment, rates of pay, and conditions of service, in so far as they differ from those applicable to men, can be considered in conjunction with the Departments concerned. It is manifestly impossible to describe in detail the work performed by all classes of women. A general survey, however, which shall be sufficiently comprehensive to convey a mind-picture indicative of the position women occupy to-day in the home Civil Service must be attempted.

Survey of Work Performed.

The names of leading women of to-day spring readily to mind. Miss M. Laurence, Established Officer at the Treasury, needs no introduction. Easily the chief woman officer in the Service she is known to many women through her activities on the National Whitley Council, where with Miss Buchanan, Lady Superintendent of the Savings Bank, she assists in its deliberations from the official standpoint. Miss Dixon, Assistant Secretary at the Board of Education, Miss Constance Smith, Deputy Chief Inspector (Home Office), Miss Durham, Chief Woman Officer in the Ministry of Labour, and Dr. Janet Campbell, Principal Woman Doctor in the Ministry of Health (not forgetting Dame Adelaide Anderson, Principal Lady Inspector of Factories, who retired last year), all have given a contribution of which women can well be proud. Almost all Government Departments now employ women; investigation of their work presents some interesting features.

In the *Board of Education* the Pensions Sections is entirely staffed by women. The work is varied, responsible and complicated; calculations of pensions for school teachers under the Superannuation Act of 1918, settlement of questions of Service and the keeping of records, all form part of the ordinary day's work.

The *Ministry of Health* employs about 80 women, whose work is of an executive nature, dealing with cases of unpaid contributions for Unemployment Insurance, regulations governing compliance with Health Insurance laws and any difficulties regarding benefits. There are also 17 women inspectors with salaries up to £400 per year, who perform, in taking their own cases in court, work approximating to that of a solicitor. There is one woman Insurance Commissioner in receipt of a salary of £1,000 per year—she is one of the few women in receipt of equal pay with the men of her class.

Prior to the Re-organisation Report of the National Whitley Council, women officers in the Ministry of Health were receiving the same pay as the male insurance officers, but in future the findings of the Report regarding pay as between the two sexes will be applied, with the result that new entrants will receive £20 less in yearly salary than was previously paid.

Reference must be made to the *Scottish Board of Health*. The Department, as it now exists, was formed by the amalgamation of the National Health Insurance and the Local Government Board. The latter was the much older and more conservative Department, and had been entirely staffed by men, any encroachment by the women on this domain being much resented. Now, however, women are working side by side with men in almost all branches. The policy of the Scottish Board is that the men and women should be interchangeable—women inspectors do exactly the same work as men—go down coal mines, visit public houses, &c., and the Woman Inspector for a District is in charge of men and women inspectors.

The *Ministry of Labour* employs a very large female staff. A visit to the offices situated at Kew would be of real interest to anyone keen on studying women's work. Acting Accountants, Assistant Accountants, Acting Examiners, Higher and Lower Clerical Officers, and Writing Assistants are occupied in work, ranging, for the higher ranks, from Certification of Claims to benefit and the keeping of the Insured Contributions accounts (with all of the necessary correspondence involved), to the compiling of statistics, &c., for those in the lower grade.

In the *Employment Exchange Service* of the Ministry, the work allotted to women is in connexion with women applicants for work and unemployment benefit. The salaries range from that for First Class Officers of £450 by £15 increments to £550, to that of Employment Clerks who receive a maximum salary of only £150. The work would be described as clerical and would include interviewing, registering and placing of applicants for work, interviewing employers and paying out benefit. A large temporary staff is at present employed, the duties of the established women being general supervision, investigation of fraud cases and the placating of irritable and dissatisfied applicants. There appears to be dissatisfaction amongst the established staff regarding their status. With one exception, that of the Great Marlboro Street Exchange, the exchange managership are allocated to men and the women feel that they are not getting their correct proportion of higher posts.

Work performed in the *Public Trustee* office has a special interest. The Public Trustee acts in numerous capacities—as Executor and Trustee of Wills, Administrator of Intestate Estates, Trustee and Co-trustee of old and new Settlements, Custodian Trustee, &c.,—much of the work is connected with legal and accountancy questions. Women clerical officers are employed in all departments.

Until recently, professional posts in the Legal and Accountants' section have been reserved almost entirely for qualified Solicitors and Accountants. It has been decided that men and women employed on accounting shall be given opportunities to qualify for the posts. One woman has already been given the rank of Second Grade Accountant.

Another *Departmental Class* which possesses particular claims on our attention is the *Home Office*. Women Inspectors were first employed in

* A paper read before the Post Office Telephone and Telegraph Society of London, on Feb. 27

Digitized by Google

1893, numbering about 30. The inspection of factories where women were employed was their chief business, but in August 1921, it was thought desirable that the Home Office staff should be interchangeable. The higher ranks comprise one Chief Inspector, two men Deputy Chief Inspectors, one woman Deputy Chief Inspector, and men and women Superintending Inspectors, also one woman Medical Inspector. The maximum salary of the woman Deputy Chief is £850 per year. A woman Superintending Inspector would be in charge of a division and in control of about twelve men and four women inspectors, with a clerical staff of both men and women. The work is very important, often highly technical and includes: the fencing of machinery, general inspection of factories and workshops, the administration of regulations dealing with dangerous trades and the administration of Truck and Factory Acts. Legal cases are, of course, frequent, and the women inspectors conduct their own prosecutions in court. They place a very high value on their work which, I am sure, could not by anyone be disputed.

Mention must also be made of the *Department of Scientific and Industrial* research, which will shortly become established. All the science women, who have been employed for some time temporarily, are to be retained and they are in receipt of the same pay as their male colleagues.

The *Foreign Office* has recently decided to employ women on account of the excellence of their work during the war period, and women in the service are keenly appreciative of the recent action of the *Colonial Office* in selecting two women to do research work in Africa.

It would be impossible to conclude a survey of women's work in the Service without allotting some space to the volume and importance of work performed by the *Post-Offices* classes, both clerical and manipulative.

In the Savings Bank Department the staff of women has, since the entry in 1875, under the control of Miss Constance Smith, first lady superintendant of a staff numbering only 65, increased by leaps and bounds. To-day there are over 2,000 clerical women, 380 sorting assistants, some writing assistants, and 21 typists. At one time the ledger branch was divided almost equally between men and women. In 1909 the women took the whole of the ledger work, handing over to the men certain other sections. Women have had complete charge of the warrant branch since 1916.

It is worthy of note that in all the Press criticisms against Government Departments, neither the Savings Bank or Money Order Department appear to have received particular attention, and a visit to either would possibly provide a partial explanation. The organisation of staff and work is extraordinarily efficient, and the administration can reasonably be proud of these two important Post Office sections.

The Money Order Department employs 2,000 women and about 70 men At one time a male department, it was handed over to women in 1898, the chief control being reserved to men. Postal Order, National Savings and Money Order business are dealt with- the work is of a stereotyped kind, but needs care and accuracy. Much has been said in praise of the services rendered by the clerical staff—it would be unfair to omit some comment on the writing assistants' duties and those of the somewhat despised sorting assistant. It is undeniable that the simple clerical duties performed by writing assistants, for which they are paid a very inadequate wage, require neatness and exactitude, and in the case of sorting assistants, rapidity and accuracy are absolutely essential, otherwise the work of the whole department will suffer.

It remains to deal with the telegraph and telephone services. No one will deny their tremendous value and far-reaching importance. An account of the work performed by the telegraphist and telephonist will fittingly conclude a section devoted to a record of the work of women Civil Servants.

The Woman Telegraphist.

As with the male staff, the title "telegraphist" is only given to those working in the Central Telegraph Office in London. In the provinces they are called sorting clerks and telegraphists and in London district offices counter clerks and telegraphists.

The single title for the C.T.O. staff is used advisedly, because, with the exception of non-manipulative work relating to the office circulation of telegrams, only instrument duties are performed, and also, as the premier office of the country, greater concentration is accorded to the production of the telegraphist par excellence. Being the centre of the very intricate telegraph system of the whole of the United Kingdom, it is in the C.T.O. that the biggest variety of telegraph instruments is to be found, and where high-speed telegraphy has achieved its highest point of development. At one time the staff employed was mainly women; now the men largely outnumber them—a point which could well be borne in mind by those who are prone to criticise adversely the claim of the women for a more extended share of the work.

Prior to the war, women were employed principally on the Metropolitan work, circulation day work, and in one large provincial section. They were given the same training as men, with the addition of sorting and tracing practice for rapid distribution and location of telegrams, and, while a number of sections were staffed solely by men, the women were liable for duty in any part of the office, when placed on the spare and reserved lists.

During the war, the position became similar to that prevailing in outside industry—where formerly a few girls here and there were to be seen, there were now hundreds; even the cable room was invaded, for so long sacred to men only; and at one time over 80 women were giving excellent service on the lines to France, Italy and Holland, at a period, it should be remembered, when the more stable lines to the Continent were not available for other than military use. Since the war women have been retained on all instrument work, with the exception of that performed in the news and racing sections. The present arrangement appears satisfactory both from an administrative point of view and also to the women whom it enables to keep in touch with the whole of the operating that they can be called upon at any time to perform. The introduction of high-speed telegraphy has found the women easily adaptable and quick to learn new methods of signalling.

Technically, women in the C.T.O. have done well. Since 1906—on three separate occasions—the medal awarded by the City and Guilds of London for telegraphy, and competed for on equal terms by men and women throughout the country, has been won by a C.T.O. woman. There are several women in possession of honours certificates in telegraphy, magnetism, and electricity, and a fair number are in possession of First Class Technical Certificates. In 1912, women possessing the necessary technical qualifications were studying the intricacies of the Baudot installations, and in 1918 there were five women in charge of Continental Baudot sets; at the present time, there are six women on the list of Dirigeurs for inland working, and their example has been followed by women in Manchester, Edinburgh, Sheffield, and Norwich. It is probable that there are women in training in other offices, but it must be remembered that the facilities in provincial towns for acquiring the necessary knowledge are smaller and less easily accessible than for those resident in London. Testing of lines and the removal of instrument faults are also performed by women.

Counter Clerk and Telegraphist, Sorting Clerk and Telegraphist.

The provincial women and the London counter clerks would probably, and rightly, resent any suggestion that their work was less valuable than that of their colleagues in the C.T.O., and they would seek to state their case on the lines, that in addition to a knowledge of telegraph manipulation, they are required to familiarise themselves with duties performed in the sorting room and at the counter.

A counter clerk at a small Post Office arriving on duty at 8 a.m., would proceed to unlock the safe containing cash, postal orders, postage stamps, &c., and allocate them to various counter drawers. She would then finish off the previous day's accounts ready for the Postmaster, prepare daily requisitions for fresh supplies of postal orders and stamps, and the forms required for the day's use and she would also check the time at which messengers sign on duty. Her duty at the counter then commences, and when not engaged in serving the public, she will time and send out all telegrams, inspect the messenger's pouch each time he returns and make a note of the time on a sheet specially headed for that purpose. She will also assist when possible in the instrument room and sorting office. Concerning counter work, whether it be in a large or small office, she must be ready at any time to deal with any branch of Post Office business—necessitating at least a nodding acquaintance with practically every Post Office rule in existence. There are separate books of rules for Savings Bank, Money Orders, Parcels Post, Foreign Parcels Post, Telegrams, Foreign Telegrams, Express Post, Cash on Delivery System, &c., not forgetting the Post Office Guide. While it is impossible to know every rule, she must know where to find it, and possess enough general knowledge to be able to apply it. For instance, should a customer desire to send a letter by express post to St. Malo, the counter clerk would need to calculate quickly the business charges, which would include a 6*d.* fee for sending the letter to the local station, and 3*d.* stamp for postage, a 6*d.* stamp for the local express fee in St. Malo, 4*d.* in coppers for railway fee, 1*s.* for a telegram (addressed to Postmaster, Southampton, asking him to send a messenger to convey the letter to the St. Malo boat) and last of all, a charge of 6*d.* on the letter for the messenger's journey to the boat.

In addition to the sale of postage stamps, and stamped stationery, there are inland revenue stamps, which include those used for Marriage Licences, Bankruptcy, Judicature, Civil Service Examinations, Bills, together with papers and parchment stamped with different amounts used for drawing up legal documents. There will also be Life Insurance, and Annuity Business, work connected with the Savings Bank, Government Stock, Money Orders, Postal Orders, Pensions, National Savings Certificates, together with the sale of Licences for Dogs, Guns, Armorial Bearings, Motor Vehicles, Brewers and Male Servants. All licences must be prepared in duplicate, and a copy has to be sent weekly to the Customs and Excise Authorities. In connexion with all types of counter work, there are daily and regular returns to be furnished monthly, quarterly or yearly, and the sorting clerk and telegraphist at a small office has to prepare these in spare moments! Rule books must be kept corrected up-to-date. At the close of the day a daily balance has to be made.

Criticisms levelled against the woman counter clerk do not trouble her unduly; she takes a pride in the accurate and wholly efficient performance of her work, and would tell you that in spite of its exacting nature, and the sometime ungraciousness of members of the public, she occasionally finds compensation in an appreciation of humorous situations inseparable from her calling. She is expected to know everything about everything, the exact hour a letter posted now will be delivered in the Outer Hebrides—why a telegram handed in in Australia is delivered an hour before it started; and what will be the safest way to send £2 16*s.* 2½*d.* to my sister in Rhodesia!!! There is an interesting story of a well-to-do lady who received a telegram—the delivery copy of which was delivered from a Post Office in the West End. The receiving telegraphist possessed a somewhat unusual style of handwriting—hardly the orthodox Civil Service style, but good and perfectly legible. The lady complained that the writing was disgraceful and wound up her tirade by saying: "*why, it might have been one lady writing to another.*"

Digitized by Google

There are also customers who need special treatment, such as the Old Age Pensioner, the Child Depositor, and also the illiterate person, who, though shrewd enough in money matters is terrified at the thought of filling up any kind of document. Reference to the need for a working knowledge of the sortation of letters, and the preparation of mails must not be omitted from this almost too lengthy account of the duties of the counter clerk and sorting clerk and telegraphist. A good memory and a general knowledge of geography are required to deal with a circulation which varies at different hours of the day, and the rules governing surcharges as to what will or will not pass as printed matter. These regulations are very complicated, and it has been said that there are only two people in the Service who known exactly what they mean—and even these two cannot agree !!!

Telephone Operators.

Last, but not least, it must be borne in mind that telephone operating forms part of the daily round of duties allocated to the man or woman for whom the public show too little patience, and against whom has been levelled much unjustifiable criticism. But they are not alone as recipients of attacks from the Press and the public. Probably no section of the Post Office administration has been so severely censured as the telephone service, and a defence of the telephone girl could not be omitted from a paper purporting to deal with the work of women as Civil Servants.

Early in the agitation against the telephone service (as administered by the Post Office), a head-line of considerable interest to telephonists appeared in the daily papers. It stated that they were in receipt of wages amounting to £6 per week and commented on the generosity of a public department that spent the tax-payers' money in grossly over-paying a staff of girls who failed to give the said tax-payers the services considered to be their due. The amount quoted was, of course, incorrect—the highest paid telephone operator, even in the days before the 1921 drop in the War Bonus, received little more than £4 per week, and it is certain that not one of those responsible for the attack and the inaccuracy, would have been prepared to perform the exacting duties of a telephonist for that amount of money. It is fashionable to commiserate the public when discussing the telephone service, but those who have watched the work of an operator on a busy section are in no doubt on whom their sympathies fall.

To work directly with the public must always call for unlimited patience, concentration and tact—to perform such a service at the end of a telephone line, gives to some members of the public unlimited license for all kinds of wilful and unwitting misunderstandings. The telephonist in a large exchange usually occupies the same position along the exchange board from day to day, so that in time she is familiar with the normal requirements of her subscribers. She must enter the exchange with her instrument already adjusted and she is not allowed to move from her position until released by another operator. Many subscribers are quite ignorant of the fact that with others they form a group of persons all demanding at the same moment attention from the exchange operator, and they ascribe a few seconds delay—due to a period of pressure—to deliberate neglect. Tact and courtesy are constantly employed to keep them in good humour, and it may be that the regulation restricting the operator's powers of soothing to a few standard phrases is responsible for the irritability shown by many subscribers.

A group of eight positions is usually in the charge of an Assistant Supervisor—whose duty consists of rendering assistance in every way possible of supervising the general work of her girls, taking note of delinquencies and checking errors where necessary. Fortunately for the woman telephonist, there are certain clerical duties which she can occasionally perform.

Promotion prospects for the telegraphists and telephonists are to be found within their own class. Women telegraphists can proceed through Assistant Superintendents and Supervisors appointments to the position of Chief Supervisor carrying (in London) a maximum salary of £300 per year. Telephone operators, at the expiration of about 12 years' service, can become Supervisors, Class II, and eventually Supervisors in charge of exchanges at a salary of from £170 to £220 per year.

Women in the two grades can compete under the findings of a recent Post Office Departmental Whitley Report, for a limited percentage of vacancies in the clerical grade.

It is not possible to discuss the position of women in the Civil Service without touching upon some of the general problems affecting women wheresoever they may be employed.

Equal Opportunities.

For some years past women have been asking for equal opportunities with men, which without doubt, includes a claim for opportunity of service on the highest work the Civil Service has to offer—whether it be of a manipulative, clerical, executive or administrative character. They say, in effect—give us the human right to *choice* of occupation equally with men; in doing so they do not ask for preferential treatment—the demand is for a common examination and they desire acceptance on merit alone.

Most women and men are anxious in this matter as in others, to arrive at a judgment both on the general and particular cases which will be fair to both sexes, and their difficulty or facility in reaching a conclusion must of necessity be coloured by their views on the whole position and status of women in the world's affairs.

The problem would seem to revolve itself into three pertinent considerations, which are: the interests of the community; the woman; the man. If these can be answered then you have the solution, but, even so, while the correct theoretical answer may be thus obtained, it must be admitted that its practical application may not be so simple.

It is not possible to state in detail the whole case; such an attempt would not be proper to a paper written regarding one class of women worker only. Perhaps it is sufficient to state that, if the interests of the commnuity are of importance, the claim made by women regarding the value of their services in those departments where they are at present employed, must be given its due weight.

As long as 1881, Mr. Fawcett, then Postmaster-General, signified his confidence in the ability of women Civil Service clerks by staffing the new postal order branch entirely by women, and they still retain the whole of this work.

Sir Alex. King, in 1906, in his evidence before the Select Committee, on Post Office Servants, stated that the work handed over from the Second Division Clerks to the women clerks was performed equally well by the women as by the men.

In 1909, Mr. Sydney Buxton paid a tribute to the women's work in connexion with the Quarterly Returns of Licences sold by Postmasters, which had previously been done by the Inland Revenue—the work was carried out under great pressure of time, and personal messages of congratulation on the manner in which the work had been despatched were sent to the staff. One more pre-war quotation—Mr. Herbert Samuel in 1911, stated that at a meeting of County Council representatives a high compliment was paid to the efficient work done by the Accountant General's Department in connexion with local taxation licences, and he was pleased to discover that the work referred to had been carried out by the women clerks.

As we all know, during the war the praises of women were sung almost *ad nauseam*, and we find no evidence, even in these days of unpopularity of the Civil Service of any attack directed particularly against the *woman* Civil Servant. She suffers at the present time equally with her male colleague under a grossly unfair and unfounded charge of inefficiency.

Women are not seeking to obtain for themselves an *unfair* proportion of Civil Service appointments—they prefer the comradeship of men to a futile and inevitably harmful sex antagonism and rivalry, and in claiming freedom to give of their best they are only urging a human right which should be beneficial to all.

It is argued that as most men have dependents to support they should therefore by right be given the work which will give the highest monetary return. Against such an argument, the claim for economic independence now being urged by and on behalf of married women must be borne in mind. It would seem that the ultimate solution of the problem will be along the lines of such a principle, which is one which will probably also finally solve another vexed problem, that of equal pay for women doing equal work with men.

Equal Pay.

For many years an agitation for equal pay has been carried on. Groups of men and women, Associations and Trade Unions have, with few exceptions, recognised the claim, and pressure has been brought to bear upon the Government and upon employers in general. Up to date the progress has not been rapid. The non-acceptance of the findings of the War Cabinet Committee on women in industry aroused considerable indignation. Evidence was tendered for Civil Service women and special mention was made of their work in the Committee's Report.

Equal pay was recommended and Civil Service Officials could have, had they chosen, upheld the decision of this Government committee, when the question came before the National Whitley Council in 1919 and 1920. The opportunity arose on the setting up of a sub-committee to revise methods of recruitment and scales of pay for the clerical classes in the Civil Service. A good case was put up by the staff side, but the final report signed by every member of the committee, contained only a partial concession. Equal pay was conceded to girls up to the age of 22 years. The arguments on the official side centred round the marrying age for men; the claim for senior women, a number of whom also have dependents, was ignored. But it must be admitted that the question is by no means easy of solution. All would agree that equal value in work should receive equal remuneration in return, and that no employer is entitled to benefit by the economic necessities of those employed.

At the same time it must not be forgotten that the wages of men have been laboriously built up through many generations, and undoubtedly, a determining factor in the rates paid at every stage in industrial history has been the function of men as bread-winners. For this reason, the way of solution seems to point inevitably towards a drastic change in the economic position of those women who are engaged on the important work of home-making and child-rearing.

Such a change does not, however, appear to be within the range of immediate application, and in the meantime women in the Civil Service and elsewhere are subtly reproached for accepting lower rates of pay, a stigma which a study of the early history of women's entry into the labour market and a consideration of the many points involved is not altogether a fair one. It is even suggested that women ought to refuse to perform the highest duties of their class, and should not endeavour to prove their ability to perform any work but the lowest of the grade concerned, until the equal pay claim is conceded to the full. The effect of such a sacrifice on the part of women would be to *lower* even their present status, the harmful effects of which would be felt not only by themselves but by the Service as a whole, and in any case would not solve the question at issue or appreciably help towards that end.

Status.

When women speak of their status it will be found that they are concerned rather with the position occupied by their sex than with that of individuals, and in this sense it is important to bear in mind, in determining its quality, the important relation which to most people's minds, salary bears towards it. Apart from the ethical side of the equal pay question, there

Digitized by Google

are women who attach more value to status than to an increase of salary, badly though that may be needed and, in so far as such an attitude is the outcome of sex-pride, a desire that women should prove themselves able it is utterly praiseworthy. But, however that may be, the fact remains that Government Departments are not free from the tendency to judge the status of men and women in similar proportions to their differing rates of pay, with a consequent variation in the degree of authority relegated to them.

In this connexion, it is desirable to study the committees of enquiry and wage settlements that have made recommendations during recent times; to incorporate in my paper an investigation of such magnitude is not possible. It must suffice to discuss briefly the Report issued by the Civil Service National Whitley Council on the re-organisation of the clerical classes. Important though the findings of previous committees have been, it is probable that this Report transcends them all in so far as it affects the recruitment, pay and conditions of service for women.

Re-organisation Report. National Whitley Council.

That parliamentary activities were immediately set up by the women's societies in order to press the claims that were only partially met in the report speaks eloquently of the disappointment felt by many Civil Service women. These women were not alone in their apprehensions—other sections of women workers—notably teachers and head-mistresses viewed its recommendations with grave concern, believing that not only were they themselves indirectly affected, but that the future careers of the girls of whose educations they had charge would also suffer.

Section III of the Report is entitled "The Recruitment and Status of Women in the Civil Service." It declares that "The status and authority of women shall be identical with that accorded to men in parallel classes," that the "minimum of the basic scale of pay in each class should be the same for women as for men," and that it is the Committee's earnest desire "to ensure that the opportunities afforded to women of proving their fitness to discharge the highest administrative duties of the Civil Service shall be full and liberal."

The reading of this section would at first sight appear to contain matter for encouragement and hope, but its application has given rise to much bitterness and disappointment.

That the members of the Committee made a strong and honest attempt to solve the problems which faced them is not disputed, neither is it contended that no progress has been made towards meeting the aspirations of the women—maybe the opposition encountered and the difficulties confronting the Committee have not been sufficiently appreciated.

The acceptance of the principle of equal pay up to the age of 22 years, while being admittedly a step towards its final achievement, cannot but give rise to discontent. It introduced a differentiation on the grounds of responsibilities, yet it is not prepared to treat the bachelor woman on a level with a bachelor man; neither does the report recommend equality as regards the married man with dependents and the single woman with dependents. It is also the opinion of many women that the restriction of equality of pay to the earlier increments, almost nullifies the agreement laid down in the initial part of the report that the status and authority of men and women shall be equal.

This report reduced the number of administrative and clerical classes in the Civil Service to four, to be called administrative, executive, clerical and writing assistant classes, and the injury to the position of women in the re-arrangement of work lies in the extension of the class of writing assistants, and in the methods of recruitment for the higher class. Whereas, for men, the recruitment for administrative posts will be by open competition and promotion from the lower grade, the women will be recruited by a selective process. There are many general objections to the latter method, but the real insult to women consists in the implied lack of suitable candidates through the ordinary channels, with the additional objection that a loop-hole is thus left to the department at the end of the experimental period authorised in the report to assert that equality of work has not been fully proven because the methods of recruitment for the two sexes were not identical.

In discussions on the report since its publication little comment is made regarding the fourth class to which is designated all work of a simple and routine character, and it is here that women have cause for ascribing much of Section III quoted above as being mere lip service to principles which, to women, mean so much.

Writing assistants' positions are to be recruited locally, are not open to men, and carry a maximum rate of pay of 36*s.* per week. It constitutes an attempt to saddle the women with *all* routine work required in the Service, with the obvious consequence that the future fight on their part for a just share of the *higher* posts and more interesting work will be badly handicapped. Local recruitment ensures that the service shall be cheap. Girls are to be discouraged from the exercise of a proper spirit of independence, being expected to live with their parents and to pay for their board and lodging a far smaller amount than they would be called upon to pay elsewhere.

It has been alleged that some sections represented on the staff side of the Whitley Council were little inclined to fight the proposition for the perpetuation and extension of this class because they were anxious to increase the importance of their work by eliminating all which was of a purely mechanical character. If this be true, it is a matter for regret that so little regard for the future position of women was shown.

Supervising Positions for Women.

As has already been indicated there is in evidence a reluctance to place women in positions of authority. In sections where women are in the main new entrants, the monopoly by men of the positions of control calls for little comment—the necessary adjustments to meet the claims of the women will, it is anticipated, be made in due course. but where, as in the case of the London Telephone Service, the bulk of the staff are women, it appears unjust that the higher controlling positions shall be reserved for men.

It may be interesting in this connexion to give some thought to a comparison of the qualifications of men and women for work of a supervisory character, but it is necessary, if a true criticism is to be made, that there shall be eliminated any prejudice against women as women, and any antagonism against men as men.

To possess a thorough knowledge of the work—to understand the staff—to be alert and tactful and able to apply rules and regulations without undue rigidity—these are a few of the qualifications required for successful supervision. Women, when given an opportunity, show considerable powers of organising and they have a highly-developed sense of the effectiveness of order and method in the general arrangements of work. Responsibility usually finds them keen to understand thoroughly the work placed under their control, and concentration on the smallest details amounts with them almost to a fault. Then there is the quality of tact in general management and in questions of discipline. Women have been accused of petty rigidity and narrowness of vision; if the condemnation were ever true it is necessary to discover the cause, and therefore to look back into history for evidence of training which would produce such faults.

In entering new spheres of action, women brought with them the traditions of centuries of repression, with the obvious tendency to cling tenaciously for safety to literal interpretations of instructions given merely for guidance, and to be timid of stepping outside well-defined paths. Domestic traditions also taught them to be painfully conscientious and often intense devotion to a high code of conduct led them to try to exact rigidly from those under their control an attention to the ordinary tasks of the day which were beyond the power of common-place human nature to reach. And so, unconsciously, the woman controlling officials may have made for themselves a reputation which, while being excellent from the point of view of output, was of such a nature as temporarily to hide a genuine kindliness which without doubt most of them possessed.

But women learn very quickly, and the faults of which their predecessors were accused have been found capable of modification in such a way as to make their present value in the capacities of supervising officials of a quite high order, and it can, with truth, be claimed that women of to-day reflect the greater freedom accorded to them, notably in their attitude towards their work and their staff.

Supervision of Men by Women.

Women are in many departments pleading for an extension of their powers. They claim the right to compete for more and higher appointments, involving if necessary the supervision of both sexes, always providing that they prove their fitness. One of their handicaps is the traditional opposition of men to supervision by women. A hopeful sign, however, is the fact that its strongest expression is to be found amongst the lower ranks of the Service. There are instances of men in higher positions who find no indignity in having for their chief a woman of proved ability, who has won her position fairly by merit. An interesting story appeared in the February issue of *Opportunity*, the organ of the Federation of Women Civil Servants, is worth recording:

"In a certain department, it was desired to employ temporary men clerks on work which was in charge of a permanent woman, but the authorities were so imbued with the tradition that men will not work under women that they established a Grade 1, temporary clerk in charge of the other temporary men as an intermediary. One day, when he was giving instructions to one of his subordinates, the latter said 'Look here, you jolly well clear off. What do you think you are, anyway? Miss G—— is in charge of this room, and I'll take my instructions from her, and from no one else!"

While in this question, as in others, there are difficulties in the way of practical application, and in the absence of a common establishment list, perhaps legitimate grievances for senior men, the generally accepted principles incorporated in the Sex Disqualification (removal) Act, should preclude the necessity for an exposition of the women's claim.

(To be continued,)

TELEPHONE CHARGES.

THE principal revisions of telephone charges which will become operative on July 1 next are—

(1) Reduction of 7*s.* 6*d.* per quarter or (£1 10*s.*) per annum in the rental for residence connexions for the first line, and 5*s.* per quarter for auxiliary lines to private houses.

(2) Reduction of 7*s.* 6*d.* per quarter in the rental of two-party line residence connexions.

(3) Reduction of the charge per mile for extra mileage of exchange lines from £10 to £8.

(4) Reduction of the charge for local calls from 1½*d.* to 1¼*d.* and for calls from 5 to 7½ miles from 3*d.* to 2½*d.*

Trunk line charges for distances above 35 miles will be reduced by 1½*d.* a call between 7 a.m. and 2 p.m., and between 7 p.m. and 7 a.m. Reduced charges for calls between 2 p.m. and 7 p.m. will come into force. For example, 3 minutes' calls for a distance of 35 miles can be obtained for 10*d.*; 50 miles for 1*s.* 1*d.*, 100 for 2*s.*, 200 miles for 3*s.* 6*d.*, 300 miles for 5*s.*, and 400 miles for 6*s.* 6*d.*

LONDON ENGINEERING DISTRICT NOTES.

Institution of Post Office Engineers.

THE Annual General Meeting of the above Institution was held on Tuesday, May 9. The Annual Meeting is always an event, as the Council under the Chairmanship of the Engineer-in-Chief reports progress. On this occasion the Secretary was able to announce that the financial difficulties brought about by the War are rapidly disappearing and that the future is a bright one. London members were pleased to be informed that the Chairman and Vice-Chairman of the London centre for the next session are to be Mr. McIlroy and Mr. H. Wilson, respectively.

After the business of the evening had been completed, Mr. P. T. Wood was called upon to read his paper on "A Year's Work in a London Engineering Section." The majority of papers read before the Institution are of a highly technical character, but it is recognised that the Institution has a two-fold duty to its members. Firstly, to keep them informed of the latest development of the art, and secondly, to give due meed of attention to the executive side of the business. The rapidity with which one speaker followed another during the very interesting discussion that followed was a very clear indication of the interest taken by the audience in the subject chosen by Mr. Wood for his paper. It is possible that in some quarters the opinion is held that work in a section is merely a matter of conforming to regulations, and that there is no scope for the exercise of technical ability or power of organisation. This is very far from the truth as was made abundantly clear by Mr. Wood. The gradual process of devolution that is going on makes the powers and responsibilities of Sectional Engineers progressively greater. Mr. Wood, who dealt with the work in the whole of the Centre Section, both internal and external, was able to report that the development work is so forward that there is not a single demand for service that cannot be met at short notice. To Mr. J. Brown, the External Engineer, and his staff must be awarded much of the credit for this satisfactory state of affairs. It is impossible in these notes to mention all the interesting points dwelt on by Mr. Wood, but it was noticed that one subject referred to evidently touched a responsive note in the minds of his audience. This was the little value which is apparently attached by the authorities to titles in the Engineering Department.

Youths who have reached the age of 21 are graded as Labourers, or when a vacancy occurs as a Skilled Workman. In Mr. Wood's own words—"to an ambitious youth who has possibly had a secondary education, the title is not one that can carry self-respect with it, and on this account is to be deprecated. I would suggest that a new title be found for these young men awaiting promotion. A young aspirant to the post of Traffic Superintendent by the time he is 21 can be pretty sure of possessing the proud title of Traffic Superintendent, Class III, and though I should not call an Assistant Fitter an Engineer, Class 7, I would do what I could to raise his self-respect by a title other than labourer. It is also a matter of interest to note that Traffic officers responsible for an area equal to a section sign their letters as District Superintendent, whereas the lesser title of Sectional Engineer is allotted to a post of greater importance and with wider responsibilities."

After the meeting the writer of these notes crossed the Embankment to catch a tram and noticed a man whose duty it is to pull a lever at intervals to divert certain trams on to a branch line. Remembering Mr. Wood's words it occurred to him that this man, who is probably graded as an L.C.C. labourer, would be much prouder of his job and would perform it with much greater vim if he were given the title of "Traffic Controller," even if for staff record purposes, it were followed by the words "Class X."

Exchange Works.

The new temporary exchange in the Kilburn area, which is known as "Maida Vale," and which will give relief to Paddington, is progressing rapidly. The internal and external staffs are vieing with each other to complete their portion of the work first. There is a very good prospect of the exchange being opened during August. The premises were formerly used as a Fire Brigade station, and required only minor structural alterations for the purpose of temporary exchange premises. The permanent exchange will be erected on the same site and at the rear of the existing building, which will ultimately be used as operators' quarters and offices.

Telegraph and Telephone Society's End of Session Meeting.

It is not often one is so fortunate as to listen to such an interesting and instructive lecture as that given by Mr. A. B. Hart, Assistant Staff Engineer, Engineer-in-Chief's Office, on Monday, April 24. The subject was "High Frequency Carrier Current Transmission in Telegraphy and Telephony."

There is so much misconception regarding how a lecture should be given that special reference must be made to the fact that Mr. Hart is a lecturer par excellence, and others who aspire to impart information to either a technical or non-technical audience might study his methods with advantage. Unfortunately the time available for Mr. Hart's lecture was limited by the fact that the business of the Annual General Meeting had to be conducted first. The first portion of the lecture was devoted to the historical aspect of the subject both within and without the Post Office. In this connexion, the valuable work performed by General O'Squier of America was mentioned. The lecturer then went on to describe the underlying principles and fundamental circuits of the system in its present day form. The impetus given to research in this field by the invention of the three electrode thermionic valve was made clear, and a very lucid explanation of how a valve acts as a high-frequency generator was given. The method of modulating the carrier course was explained, but the reverse process of demodulation was not reached, owing to the time limit.

Mr. Hart explained the uses so far made of the system in this country, and made some guarded prophecies as to its possible development. The rival merits of various names for the system were touched on during the discussion. The lecturer claimed that such expressions as "wired wireless" and "line radio" were unsuitable because they convey a wrong conception of what actually takes place. He claimed that the system is correctly described by the title under which the lecture was advertised and as given above. The meeting was graced by the presence of Colonel Sir A. Ogilvie, who opened the discussion.

Thrust Boring.

Readers of these notes will remember reference being made to the method adopted for laying cables beneath the Channelsea River at Stratford for feeding the new Maryland Exchange. A deep pit was sunk on each side of the river and 9 holes to take iron pipes were made by the Mangnall Irving Thrust-Borer System. Cables were subsequently drawn through the pipes. The arrangements have proved quite satisfactory despite the fact that the cables are partly submerged in water. Those desirous of knowing more about this interesting process are referred to a descriptive article in the *Electrical Review* for April 21. The process is being used in connexion with cable laying under roads without having to disturb the surface, which is generally an expensive operation, especially when one of the modern methods of road making such as the use of reinforced concrete has been adopted.

The process possesses great possibilities and will be watched by telephone engineers with interest.

Telephone Construction in the Wild West.

No one disputes that benefit is derived through transferring one's body from its usual environment to some pleasant strand where *dolce far niente* can be indulged in. It is equally beneficial at times to let one's mind wander to fields afar, even though there may be a link between the subject under consideration and one's daily work. In the tight little island on which we live our operations are perforce apt to be condensed and concentrated, and it is refreshing to read of the entirely different conditions which are encountered in providing telephone lines a distance of 5,600 miles across every conceivable class of territory, including blazing deserts, flooded valleys, and snow-capped mountains. In an interesting article headed "Conquest of No Man's Land," in the October number of *Telephone Engineer*, the romance of the work involved in linking up New York with the island of Catalina in the Pacific Ocean is described in glowing colours. The most interesting portion of the story deals with construction work in the "Lean" Region, between the Pacific Coast and the Western States, comprising an area of more than one-fifth of that of the the entire United States. In parts neither horse nor mule is of any use, as only the Mexican donkey and the native Mexican can find sustenance on the wastes. The difficulties of transporting line stores under such conditions can be imagined. In one part the thermometer frequently registers 120° in the shade. Special precautions are necessary in crossing sun-baked stretches, which, at intervals, of some years possibly, are converted into raging torrents.

A lineman's "length" for maintenance averages 2,000 miles, and the average fault duration is 7 hours. Those who saw the Western Electric Co 's films dealing with the thermionic valve and its applications, will remember seeing a call put through between New York and San Francisco, and the line creep across the map. After reading the article referred to above, one gets a better understanding of what is involved in constructing and maintaining such a 'ine and its extension across No Man's Land.

Municipal Engineering has been taking architects to task for not making adequate provision in buildings for the accommodation of electrical services. This has been a sore point with P.O. engineers for a long time, but there has been a distinct improvement during the last few years. Telephone services and electric light services are required in practically every room in the larger buildings erected for business purposes, and it goes without saying that it is cheaper and more satisfactory to provide the necessary channels for them while constructing the fabric rather than to have to cut away afterwards. Any new building in course of erection is soon spotted either by the contract staff or the local engineer, and immediate steps are taken to get in touch with the architect or builder so that any omission may be rectified before things have gone too far.

Benevolent Society.

The fourteenth Annual General Meeting of the London Engineering District Benevolent Society was held on Tuesday, May 2, when the Superintending Engineer presided and expressed his pleasure at having been elected President of a Society, which had for its object the rendering of assistance to comrades who had been subjected to misfortune through no fault of their own.

Mr. E. Slattery, the Hon. Secretary and Treasurer, presented the Annual Report and Balance Sheet. The total membership is now 1,820, and, notwithstanding the fact that the subscription has been reduced to one penny per week, the total grants to necessitous cases amounted to £213 in sums varying from £1 to £10. A donation of £60 was made to the Hospital Saturday Fund, and the balance in hand was further increased.

During the year no less than 184 hospital letters were obtained for subscribers to the fund, and it is difficult to estimate the benefit which the members have received from the special treatment in hospitals and convalescent homes as well as from the supply of surgical appliances.

Although the membership is large, it is hoped that there will be a further accession of strength during the year. Subscribers have the double satisfaction of knowing that if they fall upon evil days they can accept assistance without any loss of self-respect and on the other hand if they are fortunate enough to escape the need of help, they know that they are providing a veritable life-buoy to colleagues who would otherwise be in imminent danger of being drowned in the sea of debt owing to heavy and unexpected expense due to prolonged sickness or other similar calamity.

LONDON TELEPHONE SERVICE NOTES.

After Hours.—Another Aspect.

IN last month's notes the service aspect of "after hours" was briefly remarked upon, but readers of these columns have been made abundantly aware of the social side of the staff's activities when the day's task is over. With so many exchanges and offices spread over the face of Greater London, large numbers of the staff must of necessity remain strangers to each other except perhaps in name. In view of the number of young people engaged in assisting London to telephone, it is inevitable that recreations of the collective variety are arranged in various centres and it is on these occasions that we have the opportunity of sharing the company of our colleagues.

These are the occasions when we see each other in a new light. The shackles of discipline are thrown aside for a while and everyone meets on equal terms.

The season for indoor recreations has just closed and the Committees responsible for organising choral and orchestral societies, dances, whist drives, bazaars and the like have, with one exception mentioned below, earned a well-deserved rest. Their places have been filled for the summer months by enthusiasts in sport, and lunch time chatter now savours of cricket, tennis, launch trips, swimming galas and so on. The compilers of these notes will be glad to have particulars of interesting sporting and social events, and, if there is room, for visitors from other exchanges and offices, a preliminary announcement in these notes may be worth while.

Apart from the activities enumerated above, mention should be made of those who either by inclination, age or unfitness for violent exercise devote their spare time to civic activities or on behalf of benevolent institutions. Their colleagues do not come into such close touch with their efforts as with others, but since their "after hours" are given up to serving a larger constituency, great credit must reflect upon the staff generally from having them in their midst.

L.C.C. Lecture Courses.

Consideration has been given recently in the London Telephone Service to the adoption of the City Literary Evening scheme of lecture courses, and it has been taken up enthusiastically by the staff. Lectures in six subjects have been arranged commencing on April 24, 1922, and continuing until July 14, 1922.

The number of students enrolled in the L.T.S. totals 208, and the various subjects selected showing the number of students attending each subject are detailed below :—

Economics	34
Art Appreciation	51
Elocution	65
English Literature	69
Psychology	58
French Literature	27
	304

Post Office Sanatorium Society. L.T.S. Committee.

Following on the recent appeal for funds for recreation purposes at Benenden Sanatorium, several members of the staff have suggested sending used magazines or books to Sanatoria for the use of patients.

It has been ascertained that these would be appreciated and the L.T.C. Committee would be grateful if anyone who has magazines or books in good condition, and can spare time for this purpose, would forward them to the Registry, L.T.S., 144a, Queen Victoria Street, from where their distribution would be arranged. It is possible that exchange libraries may have books, which could be spared periodically, and such contributions would be very welcome.

Culled from the Exchanges.

Central Exchange.

The Eldorado Swimming Club are holding their second Annual Gala at the Pitfield Street Baths, Hoxton, on Friday, July 28, at 7 p.m., when many interesting events will be decided. There will be a Ladies' Invitation Team Race, which promises to provide an exciting contest, and also a L.T.S. Open Handicap. The Honorary Secretary, Miss C. C. Curtis, will be glad to receive entries for the latter event not later than June 28.

City Exchange.

It will be remembered that when the City traffic district held their annual dance last season, many of the staff and their friends were disappointed owing to the demand for tickets exceeding the accommodation. Taking time by the forelock the Committee are glad to announce that they have been able to secure the Royal Horticultural Hall for Saturday, Nov. 4. An energetic Committee have sworn to make the affair the event of the season, and advise all who have been left out in the cold on previous occasions to make a note of the date now. Tickets will be obtainable from any member of the Trunks, Central, City and Toll Exchanges.

Regent Exchange.

Have you ever experienced the extreme pleasure of watching people thoroughly enjoy themselves, knowing that you have helped them to their happiness? If so, you will realise some of the delight of Regent when they gave their Gifford House protéges a very special treat on April 29. It happened this way. At the end of last season, the Committee of the Social Club found that they had £8 11*s.* 0*d.* in hand, so the Chairman—who, by-the-way, is Mr. Buckeridge—handed it over to the Gifford House Committee with the idea of so swelling the finances of the latter that they should be able to give the men a real gala day. It was a project very much after the benevolent hearts of Regentites, and everybody entered into it with a will. Extra donations were given by the girls. Pantries were raided to provide good things and mothers were persuaded to devote some of their valuable time to making cakes, tarts, &c. Meanwhile, the Committee had been busy with the actual plans for the day. Chars-a-banc were hired to carry the men from and back to Gifford House, Roehampton (Queen Alexandra's Hospital). Seats were booked for "Rockets" at the Palladium, and a real sumptuous spread was provided for the men after the show in the dining room of the exchange. Forty-seven guests arrived from Roehampton, and the girls divided themselves into two parties. One contingent awaited the boys at the Palladium and the others—real martyrs—stayed at the exchange and transformed the dining room into a banqueting hall ready for the arrival of the guests.

Judging by the ecstatic laughter of the men, "Rockets" must be a Revue of Revues. Also, judging by the fast disappearing dainties, the tea was hugely appreciated. There was much laughter round the flower-decked tables, and it was a difficult matter to recognise the sober old dining room, where daily, bands of business-like girls, hastily take their meals. One of the men gave a speech of thanks and then—long after they should have done so—the chars-a-banc departed with crowds of merry invalids, whose pockets were bulging with cakes which the girls had insisted the men should take for supper. Now the Committee have in their possession a delightful letter from a charming lady—the Matron at Gifford House. The wording generously testifies to the success of the day, and the sincere thanks and immense appreciation of the men for the unfailing generosity and the thoughtful attentions of their Regent friends.

"The Sinner."

I met a maiden wandering all sadly and alone,
It seemed as if a deep despair had claimed her for its own;
Perplexed, I asked "What do you here? Why so disconsolate?"
She answered me in cryptic words, all sorrowing her tone,—
"I have been late."

"Dear goodness," in amaze I cried, "Why make you all this fuss?
"'Tis surely not a matter that should set you grieving thus;
Now stay your tears, and smile again; the crime is not so great.
"You do not understand," she said, "Grim laws are made for us,—
And I've been late."

I knew her for a maiden who behaved in all things well,
In tact and discipline she soared, in wit she did excel:
She'd no excessive sick leave—right well did operate,
Why, therefore, should she murmur like the sounding of a knell,—
"I have been late."

"Oh pay back all the time you owe," I soothing, counselled her,
And let it rest." She wanly smiled and answered me, "Kind Sir,
I've paid it back, yet it shall not suffice to expiate,
My punishment for ever stays, 'tis useless to demur,—
I have been late."

"Then promise that for evermore, you'll early be," I urged,
"I've promised, and I always am," her tones indignant surged.
"But the past is not allowed to rest. Go, leave me to my fate,
For though my soul in penitence from every sin be purged,—
I *have been* late."

DOROTHY TURNER.

MR. G. NOBLE PARTRIDGE.

THE news of Mr. G. N. Partridge's death on May 5 last will be regretfully received by his many friends. After only a week's illness he died from an attack of pneumonia, but there is no doubt that his constitution had been undermined by sand-fly fever and malaria contracted during his army service out East.

Born on May 11, 1872, Mr. Partridge was educated at The High School, Nottingham, and entered the Post Office Service as a telegraphist in 1889, transferring as Junior Clerk to the Engineering Department at Nottingham in 1891. He was promoted to Second Class Engineer in the Scotland East District in 1898, and was transferred as First Class Engineer to the Metropolitan Central District in 1902, to assist in the telephoning of London. After the completion of this work he was transferred to Cardiff in 1904, and was re-classified as Executive Engineer in ordinary course.

George Partridge was not the man to stay at home when the call was sent out for men in the Great War, and he entered the Royal Engineers with a commission as Second Lieutenant in January, 1916. With the exception of about six months, he served in Egypt and Palestine in charge of lines of communication, and in the building of long stretches of important military routes, until January, 1919, when he was invalided home.

Digitized by Google

Mr. Partridge was held in very high esteem by his staff, and there were many flowers. Nearly 200 of the staff attended the funeral as a last tribute to his memory.

AN APPRECIATION.

"A primrose by the river's brim.
A simple primrose was to him
And it was nothing more."

This was a favourite quotation used on apt occasions by George Noble Partridge, and I feel that I am sadly mistaken if it does not serve to revive living memories of him to his intimate friends. They will appreciate under what circumstances he would use it, without venom and without harshness, for both were foreign to his nature, but with that whimsical good-humour which won him his hosts of friends. I never knew another man who, considering his gentlemanly reserve, made such a host of appreciative friends as quickly as he did. Not every specimen of male humanity can lay claim to be counted as a full unit amongst men, but with the passing of George Noble has disappeared a character—a man.

Mr. G. N. PARTRIDGE.

He had faults—but what man possessed of full vigour and instincts has not? Those who knew him thought most of his good qualities, and appreciated his abilities. He was a man of wide reading, and only the best literature and poetry made any appeal to him, and quotations from the poets often came forth aptly fitted to official matters under review. His sense of the ludicrous saved many a situation, and his resourcefulness and tact were proverbial.

His knowledge of human nature seldom led him astray, and his benevolent idealism in his dealings with others, and especially with his staff, endeared him to them more than I have ever before experienced. His subordinates could rely on him for all deserving support, and trusted him before all others.

His self-reliance was justified by his intellectuality, and had Fortune been less fickle, he would have gone far in the Service, as his was a mind for great things with a quick recognition of essentials, a comprehension of possibilities, and an appreciation of relative values.

It was with the deepest regret that all who knew him heard of his death, and there are few men who have been so mourned or have left such a deep feeling of bereavement amongst his staff and his friends.

E. O.

GOLF.

The season was inaugurated on April 25 when a team of 8 players of the Engineer-in-Chief's Golfing Society and of the Central Telegraph Office met at the Chipstead Golf Course. The teams were led by Sir William Noble and Mr. A. W. Edwards, the Deputy Controller, respectively, and a most enjoyable day was spent in delightful surroundings.

Singles were played in the morning and foursomes in the afternoon, the Engineer-in-Chief's team proving successful in both sessions. The meeting was thoroughly enjoyed by all, and the pleasure was considerably enhanced by the geniality of the leaders.

The following are the results of the games:—

SINGLES.

Engineer-in-Chief.		*C.T.O.*

"CENTELS" *V.* ST. BARTHOLOMEW'S HOSPITAL CHARITY FOOTBALL MATCH.

A SPIRIT of revelry prevailed in the vicinity of the C.T.O. round about 3 p.m. on Thursday, April 27, enlivening the usual drab scenes of city hustle. Business men stopped to see what it all meant as the revellers in gay costumes, some pretty, some grotesque, and many undoubtedly original, flitted about. It was the occasion of a charity match which had been arranged to be played at Herne Hill between the "Centels" and St. Bartholomew's Hospital, to augment the funds for the Bazaar to be held later in the year to provide hospital beds, and many a stray copper found its way into the collecting boxes in response to the alluring charms of the collectors.

Six chars-a-banc left Angel Street shortly after 3 p.m., the leading car containing the now famous Jazz Band discoursing sweet music to enliven the journey. The greater number, however, took advantage of the special train which the S.E. & C.R. had placed at our disposal, and which was well patronised. As we reached Herne Hill Station, the cars were just passing, the fun and high spirits still well maintained. Unfortunately, as we entered the football ground a storm burst, the rain continuing to fall heavily for nearly an hour, which somewhat damped the spirits for a time, but the natural exuberance of the C.T.O. boys and girls soon asserted itself and dominated the proceedings for the whole in spite of wet, and cold feet. The ground was now in a very bad condition in places, being almost under water, necessitating a postponement of the start until 4.30 p.m. The Rt. Hon. H. Pike Pease, M.P., H.M. Assistant Postmaster-General, kicked off. Misfortune befell the Centels soon after the commencement, their captain, W. Holden, sustaining an injury to his hip occasioning his withdrawal from any further participation in the game. A good and evenly contested struggle, with Bart's slightly the stronger side, proceeded until half time, when the score stood: Bart's 1, Centels 0, the effective shot being a fast one by Stewart Lowe, which went just inside the far-off post.

During the play amusing diversions were indulged in, the Jazz Band, which has undoubtedly come to stay, parading the front of the stands and ground, picking up gold and silver. The Bart's followers were not strong in numbers, but what they lacked numerically they made up for in initiative and pluck, at one time they made a concerted action and "won" our drum, parading the ground to signalise their victory, making the "victim" speak for itself. This naturally roused our band and by a well-conceived counter-attack they recovered the lost trophy, but only after a prolonged battle, during which Ju-Jitsu and every other method of attack and defence were tried, with an utter disregard to their nether garments and wearing apparel in general.

Before commencing the second half, the sporting spirit of the Bart's men was exemplified by their captain insisting upon our injured captain being replaced. Mr. Hichen then took the field. Enthusiasm was now worked up to a high pitch by the "Centels" pressing hard, several shots at goal only being miraculously saved by the skill of the "Bart's" goalkeeper. At last, however, Head tricked the defence and Ward saw his goal pierced for the first and only time. Bart's scored again a few minutes from "time," the final reading Bart's 3, Centels 1. The hospital men were the stronger side and well deserved their win, whilst the Centels thoroughly enjoyed the game and achieved their object, the Bazaar Fund benefiting by something over £60. We understand the Bart's boys quite enjoyed the "rag," and appreciated the fact that they themselves did not, for once, have to provide all the fun, also that several more trophies now hang in their smoke-room. It is hoped that this will become an annual affair.

The Rt. Hon. Pike Pease, M.P., H.M. Assistant Postmaster-General, Mr. J. Lee, Controller, Central Telegraph Office, Mr. A. W. Edwards, Deputy Controller, Mr. W. Ferneyhough, Assistant Controller, and several other prominent officials were present and stayed until the end, all apparently thoroughly enjoying the fun and sport provided.

THE TELEPHONE COMPANIES OF GREAT BRITAIN AND IRELAND.

BY ARTHUR E. COTTERELL.

WHEN turning over a file of old newspaper cuttings recently, I came across the following advertisement, which appeared in the *Globe*, on Tuesday, Sept. 16, 1879:—

Sole Proprietors of Bell's Patent,
THE TELEPHONE COMPANY, LIMITED.
36, COLEMAN STREET, LONDON, E.C.
JAMES BRAND, ESQ., *Chairman.*

LONDON TELEPHONIC EXCHANGE.
This Exchange is already in successful operation and a considerable number of the leading Bankers, Companies and Merchants in the City are now connected through its agency.

For terms apply to—
MR. ORMISTON, *Manager,*
THE TELEPHONE COMPANY, LIMITED,
36, COLEMAN STREET, E.C.
where the system can be seen in full operation.

This old notice is of general interest, as it relates to the opening of the first telephone exchange on this side of the Atlantic, which occurred during the previous month of August, whilst to me it served to recall those early days. I well remember Mr. Fred Ormiston. When I joined the Midland Telephone Exchange in Birmingham, in November, 1879, he was Consulting Electrician to that Syndicate, and to several other electrical concerns, having relinquished after a short tenure his position as Manager for the Telephone Company in London. It is many years since he passed away. He was a man of wide experience in electrical matters so far as they had progressed in those days. Behind a somewhat brusque manner there was kindheartedness, and a willingness to impart what he knew to others.

To many readers of this JOURNAL, whose association with the service has been limited to the period since the transfer to the State or only dates back to the closing years of the National Telephone Company, it may be interesting if a brief account is given of a few of the main evolutions through which that Company came into being and attained its full strength.

The Telephone Company, Limited, was registered in June, 1878, with offices in London; having secured the sole rights of Prof. Bell's invention for the whole of the British Isles. The aim of the Company was to establish an exchange system in London, to supply private wires, and to license local companies throughout the Kingdom to carry on similar businesses, supplying them with the necessary instruments on royalty terms, viz., £1 per annum for each receiver or transmitter, and reserving some measure of control.

The question of adopting the telephone had been considered by the Post Office with the idea of using it on private lines, and a proposal that it should be allowed to hire sets for this purpose was sanctioned by the Treasury in August, 1878.

Digitized by Google

In the early experiments Bell's telephone was used both as transmitter and receiver, and I believe this was the case with some of the original private wires, but the invention of the carbon button transmitter by Dr. Clarence Blake was immediately taken advantage of and used from the first in the British telephone exchanges.

Prior to Blake's invention, Mr. Edison had patented his telephone with carbon transmitter and revolving chalk receiver, and a dispute arose as to the Blake transmitter being an infringement of Edison's instrument.

The Edison Telephone Company of London was formed and registered in August, 1879, and within a few months established an exchange in London.

The possibilities of competition between these two companies involved some vexed questions.

The Telephone Company was threatened with litigation for infringement with regard to the Blake transmitter, without which or its equivalent its service would have been greatly impaired, whilst on the other hand, it had an immense advantage in its possession of the Bell receiver, which was far and away better than the Edison chalk receiver, which not only needed frequent adjustment but that the listener should keep turning a handle. Moreover, as the Edison instrument was a loud speaker, it was in many instances an inconvenience for the messages to be heard by everyone in the room, instead of being confined to the actual user; also the articulation was not so perfect as with Bell's instrument.

The opposing companies, being possessed with common sense, ultimately took the wise course of joining hands, thus combining under the title of The United Telephone Company, which was registered in June, 1880. As a result competition and litigation were avoided, and what was of more consequence, the new company was in possession of the master patents and thus able to command the field for the next ten or eleven years, seeing that Bell's patent was not due to expire until Dec. 9, 1890, and Edison's patent on July 30, 1891.

These happy auspices were marred, however, by reason of the Post Office having intervened with the announcement that the use of telephones for exchange purposes, or communication between the premises of other than one person or firm, was an infringement of the Postmaster-General's monopoly under the Telegraph Act of 1869.

The two companies, which had not then fused, contended that the telephone was not a telegraph, and its invention had not been contemplated at the time of the Telegraph Act. Accordingly, they refused offers from the Post Office to grant them licences subject to payment of royalty, and restriction of areas of communication. A law suit followed with the result that judgment was given in favour of the Post Office on Dec. 20, 1880, confirming that the telephone was a telegraph within the meaning of the Act. In these circumstances the United Company had no option but to accept a licence on the terms offered, the royalty to the Post Office being fixed at 10 per cent. of the gross receipts of the Company on its exchange business; licences on similar terms being granted to such other companies as had been formed in the meanwhile or were formed thereafter.

Several local Syndicates had been established in different parts of the country towards the close of 1879, viz., The Lancashire & Cheshire Telephonic Exchange, The Midland Telephone Exchange, The Scottish Telephonic Exchange, whilst the firm of Messrs. D. & G. Graham started the business in Glasgow. The Syndicates were shortly afterwards turned into limited Companies.

In February, 1881, the Provincial Telephone Company, Limited, was registered with the idea of assisting in the promotion of local companies throughout the country, but resulted in the formation of the National Telephone Company in March of that year, which acquired the licences and such businesses as existed of the Midland and Scottish Companies and of Messrs. D. & G. Graham.

Eventually the British Isles was divided for telephonic exchange purposes between the following limited companies.

The National Telephone Company with the largest territory comprising the Midlands, Yorkshire, the extreme north-western part of England, nearly the whole of Scotland, and the northern part of Ireland.

The Lancashire & Cheshire Telephone Co., registered May, 1881.

The Northern District Telephone Co., registered December, 1881.

The Telephone Company of Ireland, registered May, 1882.

The Western Counties & South Wales Telephone Co., registered December, 1884.

The South of England Telephone Co., registered January, 1885.

The Sheffield Telephone Exchange & Electric Light Co. had a local business.

The Post Office opened several exchanges in opposition, the principal ones being Cardiff in August, 1881, and Newcastle-on-Tyne in October 1882, but apart from these two the Companies did not regard the rivalry as very serious. The Newcastle Exchange, like others at Hull, Bradford, and Middlesbrough, had been telegraph exchanges which were converted from A.B.C. instruments to telephones.

Seeing that the United Telephone Company owned the master patents it may be wondered why the Post Office were able to use telephones in opposition. What happened was this, that the Company had entered into an agreement with Messrs. Scott & Wollaston enabling them to manufacture and supply telephones for *private* use but not for exchange purposes. This agreement was later on assigned to the Gower Bell Telephone Company. Curiously enough, there seems to have been a weak spot in the agreement, as although neither Scott and Wollaston, nor their assignees could use the instruments for exchange purposes, there was nothing to prohibit any purchasers from doing so. The Post Office entered into a contract to be supplied with 20,000 of these instruments, very many of which were used on their various exchanges.

Several attempts were made by different firms to produce modified types of telephones in the hope of evading the patents, and the United Company was put to much trouble and expense in upholding its rights. The most important instance was the action against Messrs. Harrison, Cox, Walker & Co. in 1882, which finally established the validity of the master patents. In establishing its case, the United Company had to disclaim certain portions of the Edison patent in consequence of which transmitters manufactured prior to July 29, 1882, were exonerated and were afterwards used by the London & Globe Telephone & Maintenance Company, Limited, which opened an exchange in London at about half the tariff rate charged by the United Company. The London & Globe Company resorted to various doubtful tactics, which created wayleave difficulties and even actual interference with the United Company's wires, as a result of which legal proceedings were commenced. Eventually, however, the United Company bought out the other for £25,000.

It became evident soon after the telephone companies had established exchanges in certain towns that something more was required than communication within the limited areas to which they were restricted by their licences from the Post Office. As a result of negotiations the Post Office agreed to provide them with trunk lines connecting adjacent towns on rental terms.

As the companies' systems were all constructed on the single wire principle, and the trunk lines supplied by the Post Office were essentially twin-wire circuits, it became necessary to resort to the use of translators to enable the companies' subscribers to be connected with the trunk circuits.

(*To be continued*).

MODERN WIRELESS TELEGRAPHY AND TELEPHONY.

BY F. ADDEY, B.Sc., M.I.E.E., FELLOW I.R.E.

(*Continued from page* 134.)

The principle of the double-wave non-switching system is shown on Fig. 35.

The transmitting set causes waves of a certain wave-length, modulated by speech received over the telephone line, to be radiated from the ordinary aerial, while the incoming waves, of a different wave-length, are received on a "frame" aerial. The action of a frame aerial will be dealt with in connexion with direction finding by wireless. For the present it will suffice to say that such an aerial consists of one or several turns of wire, usually supported on a rectangular frame measuring a few feet each way. The frame is so placed that its plane is directed towards the distant transmitting station. Electric waves from that station set up high-frequency alternating currents in the coil, and these currents can be detected in the usual manner.

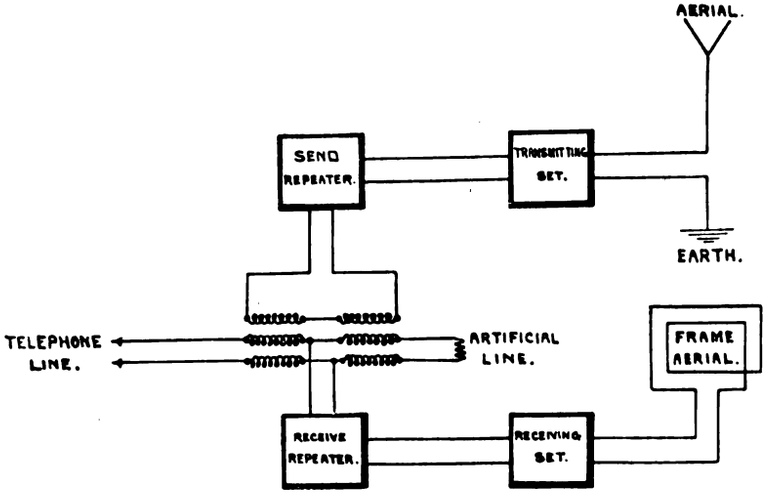

FIG. 35.—NON-SWITCHING DOUBLE-WAVE SYSTEM OF CONNEXION BETWEEN TELEPHONE LINE AND WIRELESS TELEPHONE.

The transmitter and receiver are both permanently connected to the telephone line. It is therefore necessary to provide some means whereby the signals received on the frame aerial and passed to the telephone line do not actuate the transmitter, although any speech currents coming in from the telephone line will do so. This is accomplished by the arrangements shown in Fig. 35. A rather complicated transformer is provided, having six coils which are joined in series in pairs. Each wire of the telephone line is joined to one extremity of such a pair of coils, while the other extremities of these two pairs of coils are joined together through an artificial line, adjusted to be as nearly as possible the electrical equivalent of the telephone line. The centre points of these pairs of coils are joined to a speech magnifying set, known as the receive repeater. The signals received on the frame aerial, after being detected and rectified in the usual manner by the receiving set, are magnified in the repeater, and then passed to the transformer. Here the speech currents divide between the artificial line and the actual telephone circuit. The connexions are such that these currents, flowing in opposite directions in each half of the first two pairs of coils tend to cancel one another out as regards the action which they exert on the remaining pair of coils. This pair of coils is joined to the transmitter, and if the balance between the artificial and the real lines is satisfactory the cancelling out is more or less complete and the transmitter is not actuated. At the same time that portion of the speech currents which passes to the telephone line conveys the speech to the distant subscriber.

The speech currents coming along the telephone line from the distant subscriber flow through both coils of each of the pairs to which the line is joined, and complete their path through the artificial line. Since these currents flow in the *same* direction in each coil of a pair the effects produced in the transmitter pair of coils assist one another, and so the speech currents are passed to the send repeater, magnified there, and passed on to the transmitting set, where they modulate the radiated waves as already described.

Thus the speech of the subscriber at the other end of the telephone line is radiated as modulated electric waves, while at the same time any speech-modulated electric waves of the proper wave-length, received at the wireless station, are transmitted as speech currents over the telephone line, and thus the conversation of the subscriber on that line may be interrupted by his correspondent.

High-speed Working.

In the early systems of wireless telegraphy, manual transmission was exclusively used, and for ship to shore communication the speed of working so obtained is still sufficient for practical purposes. With the introduction of wireless channels of communication between important fixed points and over long distances, however, the need was felt for an increase in the speed with which traffic could be dealt with, in order that the best use might be made of the facilities provided.

The experiments in this direction which were made before the introduction of continuous waves and of the thermionic valve did not meet with great success, and it was only with C.W. transmitters and after the valve could be used to magnify the weak currents previously available at the receiving end, and so to strengthen them that they became comparable in magnitude with the currents used in land-line telegraphy, that high-speed working became thoroughly practicable.

The circuits used are somewhat complicated, and only a brief outline of one high-speed installation will be given here.

At the transmitting station the signals are formed by a special key, actuated by an electro-magnet or by a Creed compressed air engine, and controlled by the signals from a Wheatstone transmitter. At the receiving end the high-frequency oscillations set up in the aerial are first amplified, then heterodyned, and then rectified. The low frequency currents so obtained are magnified, and are then passed on to a second rectifier. The unidirectional currents from this rectifier, which correspond in duration to the transmitted dots and dashes, are of strength sufficient to actuate a delicate relay, which is a modification of the siphon recorder used on submarine cables. In the local circuit of this relay is placed an ordinary Post Office standard relay, which in its turn controls a Wheatstone receiver.

Thus the high-speed dots and dashes from the transmitting station are recorded at the receiving station as dots and dashes on Wheatstone slip.

When signals are good it has been found possible to actuate a Creed receiver from the Post Office relay, and thus to obtain the messages in actual printed characters.

Direction-Finding Systems.

Among the most useful developments of wireless telegraphy are the methods by which the position of a transmitting station from which signals are being received can be determined. These are called "direction-finding" systems, contracted to "D.F." They depend on the fact already mentioned in connexion with the description of the "non-switching" system of wireless telephony,

Digitized by Google

that a flat coil of wire, placed so that its plane is directed towards the transmitting station, will have high-frequency currents set up in it, which currents can be detected in the usual manner. Suppose we have such a coil ABCD (Fig. 36), and that a train of waves is emitted from a transmitting station situated in the plane of the coil somewhere to the right of the diagram.

When the crest of a wave reaches the side AB of the frame it endeavours to cause a current to flow upwards, or, in technical language, it sets up an electro-motive force acting from A to B. A fraction of a second later, the exact time depending on the width of the frame, the crest reaches the opposite side CD, and again sets up an upwardly directed electro-motive force of practically equal magnitude to that previously set up in AB.

When the trough of the wave we have been considering reaches AB, a downward electro-motive force is set up in this side of the frame, followed, after the interval of time necessary for the trough to cross the width of the frame, by a similar downwardly directed electro-motive force in the side CD.

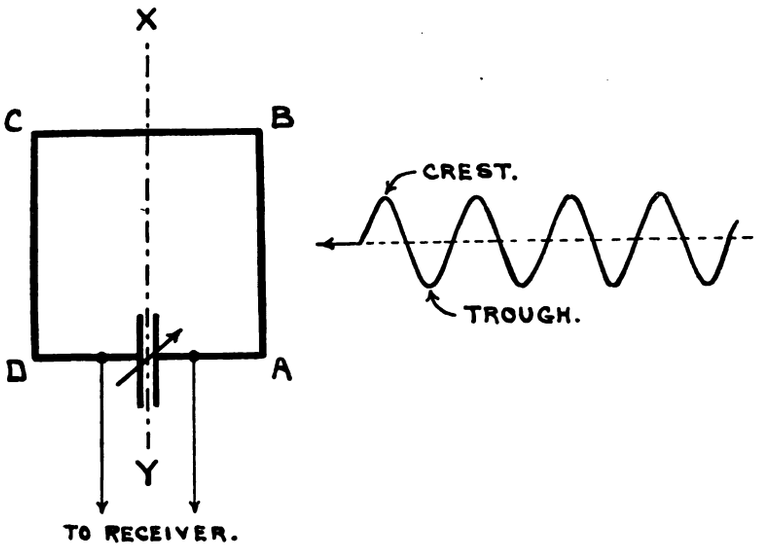

FIG. 36.—LOOP OR FRAME AERIAL.

The crest and trough of each succeeding wave similarly produce oppositely directed electro-motive forces in the sides AB and DC, those in AB always occurring at a definite interval of time before the corresponding ones in DC. The magnitudes of the electro-motive forces in the two sides of the loop at any instant are therefore unequal.

Since electro-motive forces in AB and DC directed both upwards or both downwards act in opposition to one another *round* the loop, it follows that the resultant electro-motive force acting *round* the loop will be the difference between those in the two sides. The magnitude of this resultant electro-motive force evidently becomes greater the wider the frame is made, until the width becomes equal to half a wave-length. In these circumstances the crest is acting on one side while the trough is acting on the other, and the electro-motive force acting *round* the loop is a maximum. It can be shown that this resultant electro-motive force alternates with the same frequency as those in the two sides of the loop. Hence, by introducing a condenser, as shown in the diagram, and tuning the loop to the frequency of the incoming waves, high-frequency currents will be set up round the loop, and these currents can be detected in the usual manner. Since, however, the magnitude of the effects produced in a loop is in general considerably less than that of those produced in an ordinary open aerial with the same intensity of incoming waves, very sensitive detecting devices have to be employed, and it is only since the introduction of thermionic amplifiers that the use of frame aerials has become practicable.

(*To be continued.*)

TELEGRAPHIC MEMORABILIA.

THE Genoa Conference is now a matter of a finished chapter of international history, no matter what may be our varied opinions upon it, or whatever may be the verdict of posterity regarding it. Maybe before these columns are out of the printer's hands the Hague Conference may also be classed among completed events. In any case it is apposite to remark that the telegraph and telephone have asserted their place as essential factors in all these epoch-making events.

It is therefore with special pleasure that publicity is given to the following message sent by Engineer Marchesi, the indefatigable Italian official, who literally night and day gave himself up to the work of maintaining telegraphic and telephonic communication between Genoa and the various diplomatic centres of Europe. The telegram in question was addressed to the Controller, C.T.O., London, who suitably replied to the communication.

> "Au moment où la Conference Economique Internazionale va tenir ses derniéres séances, permettez-moi, Mr. le Chef Principal, de vous exprimer en mon nom et au nom du personnel de Genes, qui represente actuellement presque tous les bureaux d'Italie, nos remerciements les plus cordiaux. Le Télégraphe et le Téléphone (c'est pas une phrase) étaient bien des outils indispensables au developpement de la Conference et ils n'ont pas manqué leur tache. Or, evidenment ce résultat satisfaisant et flattant n'aurait pu se verifier sans le concours spontané, sans la collaboration empressée amicale des bureaux correspondents pour la plus profitable exploitation des communications prédisposées. Tout va reprendre maintenant son rythme ordinaire et dans peu de jours nous abandonerons quelquesuns la ville superbe pour regagner nos respectifs bureaux mais nous garderons tous un profond et agreable souvenir d'un travail quelquefois peutêtre exceptionellement lourd mais toujours assaisonné de la plus aimable camaraderie. Encore une fois merci de grand coeur et au revoir, Messieurs, si bonne chance le voudra."

In the case of several of the diplomatic centres, a special wire was provided between their respective capitals and headquarters at Genoa. The British Government naturally was provided with a private telegraph communication between Whitehall and the Hotel Miramare, worked by British telegraphists at each end.

By the way it appears not improbable that telephonic communication between this country and The Hague may be a prominent feature of Anglo-Dutch communications, if so, our sister service will find excellent co-operation from the land of the dykes, and little, if any, language difficulty.

In a recent examination for the post of Baudot dirigeur in the C.T.O., one of the aspirants, replying to the question of "What are the duties of a dirigeur?" and in the course of some excellent technical matter, epitomised certain qualifications without which technical knowledge is undoubtedly at a discount. It is hoped that the writer of the following will forgive the publicity given to his excellent epigram on this subject, viz., *Patience and tact are as necessary as the screwdriver*!

To those who know the site of the old G.P.O. East, St. Martins-le-Grand, and the marvellous mass and variety of vegetation which has grown up out of the remnants of brick, stone, mortar and gravel during these many years, it will be interesting to learn that some photographs have been taken by Messrs. H. J. Jordan and R. P. Mitchell of the C.T.O.

The results are excellent, if surprising, for the illusion of mountain rocks and vegetation is complete, while in one case the view brings up a vision of a ruined city with a broken shard in the foreground.

Elektron in his weekly leaderettes on "Current Topics," gave some personal experiences of a telephone call made with a P.B.X. There was apparently no delay in getting through to the subscriber as far as the Post Office system was concerned, but was evidently genuinely vexed at the irritating delays which were not amongst Elektron's first and only experiences of the exchanges run by commercial concerns, for he says:—"There is little doubt that some irritating delay in getting through to the individual concerned with your particular business is incidental to half the telephone calls made to businesses consisting of many and various departments. I have experienced similar vexatious delays on previous occasions when ringing other numbers with numerous internal extensions. It only illustrates the need for proper organisation of any business establishment's telephone facilities."

Unfortunately, few private firms are capable of the fine discrimination between faults on the Post Office system and those due entirely to an ill-organised private system, as is our technical contemporary. One wonders how much of certain newspaper criticism of the Government system has been based upon data of the description above mentioned. *Elektron* seldom fails to point out any defect in governmental practice or procedure, and these very candid comments have therefore an added value.

The latest news of our old colleague, Mr. A. E. Thompson, late of the Cable Room, is that he has invented a scheme of his own for super-imposing telegraph circuits upon telephones, or *vice versa*, and that he had actually demonstrated the same before a representative of the South African Government by means of wires loaned for the purpose by one of our British railways. By the way he has also written *and* illustrated a book on the "Western Electric," as some of our readers are doubtless aware.

The German authorities announce the successful working of the Siemens' High-Speed Printing Telegraph system "through paper core telephone cable between Berlin and Hanover and also between Berlin and Dortmund by means of *sound* waves."

The annual report of the C.T.O. Benevolent Fund was held in the Deputation Room, G.P.O. North, on the 7th of last month, the Deputy-Controller, Mr. A. E. Edwards, taking the chair in the unavoidable absence of Mr. Lee, the Controller. With an all-sufficient balance in hand the Committee felt fully justified in spending the whole of its income for the year just brought to a close, and the meeting therefore cordially endorsed the following paragraph of the 48th Annual Report :—

> "With a record of prosperity unparalleled in its history, both in Membership and Income, the Fund has, during the year, proved itself true to its name and object, in having disbursed in benevolence the whole of its income to cases of urgent distress and the support of orphans of deceased Members."

The success of the Fund has been almost entirely due to the new confidence of the staff, who under the enlightened policy of an enlarged and broad-minded Committee have steadily increased its numbers and have systematically subscribed. The prominence given to the Orphan section and the success of the efforts along this particular line have been largely contributed to Mr. Samuel Pearce, ably seconded by Mr. E. Cooper.

On the sixth of last month the staff said good-bye to Mr. "Billy" Bedford, a much respected member of the Foreign Telegraphs Overseers. Mr. Bedford had for some years been closely associated with "Stationery," a term which by no means adequately described the duties of his post, which were unique as regards the C.T.O., and possibly that of any office in the United Kingdom. Our old friend was formerly a member of the Submarine Telegraph Staff and left us, we are pleased to note, in the best of health on his 60th birthday. He has the intense satisfaction of knowing that he quits the Telegraph Service, which he has served so long and so faithfully, without even the *soupcon* of anything but the best of wishes and the kindest of thoughts for a long and happy retirement.

The British Commercial Secretary at Rome not long since made an interesting statement regarding the authorised projected extensions of communications by the Italian Government. Epitomised, they are to expend 150 million lire on telephones and telegraphs. The telephone program includes :—(1) The completion of the automatic exchanges in the principal towns ; (2) the laying of new lines to carry the increased traffic ; (3) the connexion of 409 important towns with the trunk lines ; (4) the re-establishment of direct telephone communication with the principal cities in Central Europe ; (5) the improvement of audibility between the extremities of Italy ; (6) the completion of the laying of trunk line cables between Milan, Genoa and Turin ; (7) the erection of wireless stations.

Leaving the question of the English equivalent value of so huge a number of lire it is probable that the cost of the following submarine cable scheme outlined by the *Financier* will be covered by the sum mentioned above. The journal just mentioned states that a convention has been concluded between the Italian Government and the Compania Italiana dei Cavi Telgrafi Sotto-marine, for the laying, use, and maintenance of a cable between Italy and South America and of another between Italy and Greece. The former is to connect Italy with Spain, Brazil, Uruguay, Argentina and—depending upon the consent of the respective Governments—with the Canary and Cape Verde Islands. The company engages to obtain from the interested foreign Governments the necessary permits for the cable approaches and for the working of offices at cable ends.

For the duration of this convention, which is fixed at 50 years, the Italian Government has agreed not to grant to another person or company the right to bring submarine cables to Italy for direct connexion with South America, and also not to do this on its own account without first notifying the company which, on an equality of conditions, will always be given preference in matters of this kind over offers from other Italian foreign companies.

The completion of the cable to South America must be effected within three years from the date of approval of the convention. Delay is subject to penalty, and a three-year delay will cause the convention to be annulled. The cable between Italy and Greece (from Brindisi to the Bay of Butrinto) is to be completed within two years.

The "Broadcasting" stunt had a first effect in causing a considerable rise in Marconi shares with a drop in Eastern Telegraph Ordinaries, which dropped eight points. Extensions, Westerns, Globes, and Anglo-American all felt the effect of the wireless craze. Undoubtedly certain firms have scented big business, while the excitement and agitation so far as the manufacturer is concerned is humorously rhymed in a successful effort by E. G. C. in *Electricity*, from which I have taken the liberty of lifting one or two verses : It is entitled "Broadcasting—and Broadmoor," by a Works Manager.

"My firm has got the fever, the attack is really bad,
They've found a source of income and all gone wireless mad.
I'm getting rushed and hustled till I don't know where I stand.
If everything they say comes true, the future should be grand.

. . . . .

There's receivers in my armchair, detectors on the mat,
Condensers on the table, insulations in my hat,
Drawings in my pockets and circuits on my brain,
And heaps of correspondence I don't want to see again.
There's castings, dies and samples all scattered round the floor,
My once so tidy office is now like a broker's store.
There's atoms in my inkwell, and wrinkles on my brow.
If something isn't settled soon there's sure to be a row.
I talk all through the morning, in fact I talk all day ;
I talk until my throat is dry and still there's more to say.
I talk again all evening, and at last when I get home,
The wife does all the talking then for leaving her alone."

The following item is reprinted from the *Electrical Review* regarding the developments of the chief German wireless station.

> Considerable extensions are to be made to the Nauen wireless station to enable it to deal with a greater volume of business with the American continent. The Transradio Co. is arranging to increase its capital by 25,000,000 marks for the purpose. Included in the improvements is the erection of seven new masts 210 metres high—four of them replacing existing masts. The power plant is to be reconstructed and augmented. As one of the results of the extension communication will be established with Argentina.

The Commercial Cable Company have completed the arrangements for the establishment of a submarine telegraph cable repairing base at Queenstown. One of the Company's cable ships, probably the *George Ward* will be permanently stationed there.

The seasonal wire between London and St. Malo has been opened for the usual potato market and is being worked very satisfactorily by means of the Hughes simplex printer.

On the 12th of last month split Baudot was established between the three countries of Czecho-Slovakia, Switzerland and Germany, the three points being respectively Praha, Zurich and München. Double Duplex Baudot working is also projected between London and Praha in place of the present Hughes simplex circuit between the two capitals, as soon as a suitable submarine cable length may prove available under the North Sea.

The Eastern Telegraph Co. created a telegraphic record by cabling the three winning horses of the Derby from Electra House, London, to Bombay and Durban in 1½ minutes, to Sydney in 2½ minutes, and to Calcutta in 5½ minutes.

The Ether.—The ether of space is at least the great engine of continuity. It may be much more, for without it there could hardly be a material universe at all. . . . It is the one all-permeating substance that binds the whole of the particles of matter together.—Sir OLIVER LODGE.

J. J. T.

BAUDOT MANIPULATION.

IN the training of Baudot operators it would scarcely seem to be necessary to do more than suggest to débutants a few obvious rules and an easy method of learning the key combinations, leaving them to acquire imitatively refinements of form and style from their instructors and other expert operators. Indeed, if a well recognised method existed, that is all that would be required ; but it is a curious fact that in this country the practices at Baudot offices became widely divergent, and, after a number of London Baudotists had visited the Paris Central Office, and had seen their French colleagues at work with a distinctive style of their own, it became a serious question as to what rules provided the best basis for teaching Baudot manipulation.

FIG. 1.

We had the opportunity of discussing the subject in Paris with French experts, and are deeply indebted to M. Mercy, the author of *Le Système de Télégraphie Baudot*, for valuable letters in which he gave details of the theory and practice of Baudot signalling. There can be no question of the substantial advantages which result from such friendly interchanges of views and visits, especially on the part of those engaged daily in a common work,

Digitized by Google

and who would naturally be quick to observe innovations and to perceive subtle differences in operating methods. Neither can there be any question of the importance of exploring in the greatest detail any system of operating which tends to reduce physical effort, and views concerning Baudot training procedure expounded by M. Mercy command considerable respect. When the French ideas became known additional impetus was given to the movement already on foot for reviewing the rules for Baudot manipulation, and as a consequence a number of operating experts were convened under the chairmanship of Mr. John Lee to consider the subject in detail.

FIG. 2.

The first Baudot circuit in this country was opened between TSF and Paris as long ago as 1897. Experts came over from Paris to introduce the system and train the staff, and it may well be asked why the practices then acquired, which formed the foundation of British teaching, should have been challenged The simple answer is that the keyboard itself in both countries has undergone an important change during the past 20 years, and our colleagues in France have seen and proved the advantage to be derived from a change in the style of fingering the keys. Undoubtedly we in this country have been at a disadvantage on account of our insularity. On the commercial side of telegraphs we have been cut off from the development of Continental opinion and practice. We have lost the benefit of their instrument room experience, but *en revanshe* we venture to suggest that our Continental colleagues would have been the richer if they had been in sympathetic touch with general progress on this side. As it was the French with an extensive Baudot service and long experience evolved a new operating method, but it was unknown to the operators in this country because no means existed of periodically exchanging views freely about such important matters.

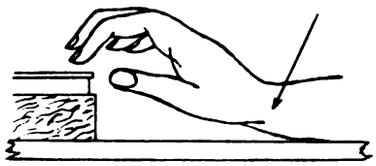

FIG. 3.—FIRST POSITION: THE WRIST IS THE PIVOT OF THE MOTION.

It must not be supposed that there is a monotonous uniformity among French telegraphists in their style of operating, for such is not the case. Slight personal variations are everywhere to be seen; and there are chiefly in use two methods of manipulating the keyboards. These methods are sometimes described by the words "piqué" and "appuyé." The former corresponds fairly well to the "staccato" touch in pianoforte playing. The latter has no exact equivalent, the converse musical expression "legato," being inapplicable: but it is generally known as the "release" method. In the first the fingers are raised after each signal; whilst in the second, the fingers are kept down on the keys which are to send out marking currents during several successive revolutions of the distributor brushes, the other keys being released and allowed to rise to their position of rest. The majority of Parisian operators employ the "staccato" or separate touch for each signal, and the best opinion is heavily in its favour. As mentioned above, the French ideas of sending have evolved with the evolution of the keyboard, The release method was in greater vogue before the locking device for the keys was introduced, in order to ensure that the depressed keys were kept down while the brushes swept over the corresponding segments of the distributor.

In the earlier French books on Baudot technique only a few words are devoted to hints on sending. MM. Poulaine and Faivre in their *Cours d'Appareils Baudot*, while suggesting the separate touch method, are somewhat enigmatic as to the use of the "release" . . . "The fingers," they say, "must be brought down simultaneously and depress without effort the keys forming the combination corresponding to the letter to be transmitted, and this must be done at the precise moment that the cadence beat is heard. The pressure must be prolonged for the longest possible time in the interval separating two successive beats. One may—*à la rigueur*—and after practice, dispense with raising the fingers which are to be brought into play in the next signal." The significance of *à la rigueur* is not quite clear, and perhaps a French mind would suffer a momentary check at that critical point. It is possibly a halting between two opinions, a hesitation at the parting of the ways. In *Le Télégraphe Multiple Baudot*, written some years later by M. Y. Caminade, an illustration, without literary comment, contains the author's directions as to the pose of the hands, but nothing is said on the question engaging our attention. It is in M. Mercy's book, republished early in 1920, that the importance of definite and detailed teaching is recognised, and several pages are given up to the subject. The new edition of this book opportunely came to hand at the time that the matter was being actively pursued in this country. This teaching together with the supplementary letters and the weighty experience of British and French expert operators have come under critical review. Resulting from the enquiries and investigations at offices in this country and in Paris, and with the collaboration of representatives of the staff, the committee has drawn up revised rules, which are quoted in their entirety below.

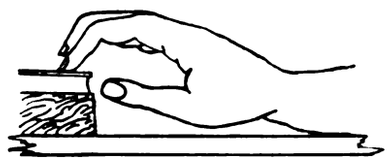

FIG. 4.—SECOND POSITION: THE WHOLE WEIGHT OF THE HAND SHOULD ACTUATE THE KEYS.

In observing French Baudotists at the keyboards, it is noticeable that they adopt a free and comfortable attitude at the desks. The keyboards are placed well back on the table, the forearms from elbow to wrist are laid lightly on the table, and there is no suggestion of rigidity or strain in the pose of the body, the arms or the hands. The fingers are slightly bent, and when the hands are raised, the tips of the fingers are about half-an-inch (1 or 2 centimetres) above the keys. The general posture has been admirably reproduced in the two photographs, Figs. 1 and 2 (which have already appeared in the JOURNAL). It should be remarked, however, that the unemployed fingers, which are shown doubled up in the photographs, may be held in the position that is most natural and comfortable to the operator so long as they are not supported upon the keyboard or desk, and do not restrict the free movement of the hands.

The distinctive feature of their operating is that it is not the fingers which supply the muscular effort for the depression of the keys. The work is done by the controlled movement of the hand as it is brought down upon the keyboard, the operative fingers having been advanced, and the fingers momentarily out of action being slightly raised so that they may not inadvertently touch the keys which are not to be actuated. The hand moves freely from the wrist, none of the unused fingers being supported on any part of the keyboard or desk; to use M. Mercy's figurative words, "the hand of the operator may be compared to a hammer, of which the metal head is represented by the ends of the fingers, and the handle by the whole of the palm of the hand." Diagrams 3 and 4 indicate clearly the general position in the rise and fall of the hand, the pivot of the movement being at the wrist. This style of sending tends to secure an assured depression of the keys in manipulating. It precludes the light flicking touch which gives rise to failures, and, on the other hand, reduces any tendency to produce trailing or extra signals.

So far as the earliest stages in training are concerned, some of our Parisian friends have improved the shining hours of their domestic life by practising without a keyboard, and they have made considerable progress. On the edge of a book about an inch in thickness, they have entertained the family circle with their diligent tapping. In point of fact, experience has shown that the cadence, the locking of the keys, and the control of signals are distractions to be avoided until the learner has become thoroughly familiar with the alphabet, and is able, without hesitation, to put down the appropriate fingers for the particular letters or characters required. When the fingers respond automatically to the demand for any desired combination, the rhythmic formation of symbols is but a short and easy step in advance.

H.B. AND A.B.H.B.

BAUDOT MANIPULATION: REVISED RULES.

"It is desirable that the operator's chair should be placed near the table so that the position of the arms on the table may be perfectly natural. Also to encourage freedom it will be better not to attempt to keep the elbows close to the body.

"The keyboard should be quite free and at such a distance from the operator as will allow the whole of the forearm to rest flat on the table (see Figs. 1 and 2).

"In signalling, the first three fingers of the right hand are used for keys I, II, III, and the first two fingers of the left hand for keys IV and V. Every signal should be made by a distinct and separate movement of the hands (the wrist being the pivot), with the fingers slightly curved and the tips of the fingers near the ends of the keys (see Figs. 3 and 4). None of the fingers or thumbs should rest upon the woodwork of the keyboards. (It is permissible, however, for qualified operators to avail themselves of a change, from time to time, to the other method of formation which retains such depressed keys as are needed for the next signal and releases those which are not required; but this method of signalling should always be regarded as a secondary and not a primary method.)

"If a comfortable position is adopted and a free style of manipulation is acquired, devices such as that of supporting the wrists by message pads, &c., should be unnecessary and should be discountenanced.

"For beginners it is desirable that cadence should not be taught at the outset. The learner should practise the formation of the alphabetical signals without cadence until the fingers required to form any letter take up their positions automatically. From this point, which may be reached after 5 or 6 hours' practice, the following of the strict cadence will be a comparatively easy matter and the learner may then pass on to progressive exercises, such as those suggested on the specimen Baudot Practice Cards."

CRICKET.

The following matches have so far been played by the Secretary's Office this season :—

(1) *Secretary's Office* versus *Exiles* (Eastern Telegraph Co.).—Secretary's Office 60 (W. C. Miller 24); Exiles 126 (D. McKenzie 7 for 49).

(2) *Secretary's Office* versus *Harrow Post Office*.—Secretary's Office 62 (J. C. Dixon not out 20); Harrow Post Office 49 (E. Rieusset 3 for 2).

(3) *Secretary's Office* versus *Alexandra Park*.—Secretary's Office 148 (D. O. Lumley 47); Alexandra Park 141 (P. P. Cove 3 for 27, D. McKenzie 4 for 42).

(4) *Secretary's Office* versus *Stores Dept.*—Secretary's Office 93 (P. P Cove 21); Stores Dept. 166 (P. V. Townley 26, E. Rieusset 4 for 22).

MULTIVERSAL TEST SET.

MESSRS. SIEMENS BROTHERS & CO., LTD., have sent us a booklet giving particulars and instructions in the use of the above testing set. This booklet is issued by their associated Company, Messrs. Elliott Brothers (London), Ltd.

The more important characteristics of this set are the number of tests which can be made with it, the ranges of voltages being from 0.75 millivolt up to 1,200 volts and the current from 1 microampere up to any magnitude by means of external standard resistances or shunts, the instrument being direct reading in all cases. Insulation resistances and conductor resistances over wide ranges, fault localisation and capacities can also be accurately measured. Amongst the special features of this test set are that :—

The Insulation Switch and Standard Resistance are so arranged that it is practically impossible with ordinary care to damage the Galvanometer in the event of the insulation resistance being low and a high battery power being used.

The Galvanometer Shunt is of the constant resistance Universal pattern with five ranges. The Instrument is direct reading in millivolts and volts.

The Instrument and Shunts can be used as a Sensitive Galvanometer.

A pair of terminals (normally short circuited by a latchet), is provided whereby an external dial, slide wire, or other resistance can be connected into the variable arm of the Bridge, thereby extending the range of measurement at will.

In testing insulation the "Constant" is taken with the same battery power as used for resistance under test.

The Test Set can be used to test Armatures, Commutators, &c., both for insulation and short circuits.

CORRESPONDENCE.

TO THE EDITOR OF THE "TELEGRAPH AND TELEPHONE JOURNAL."

Mr W. T. Cousins has been good enough to draw a comparison between Baudot and Wheatstone working which is very much to the disadvantage of the latter system; in fact, the impression it conveys is that of a snail-like Wheatstone System dragging itself wearily along behind the speedy Baudot in the ratio of 85 steps to 120.

In reality, a comparison between Wheatstone (or Wheatstone Creed) and Baudot, does not concern the respective alphabets in any way. Figures may prove that one alphabet is shorter than the other, but they have no actual bearing on the merits of the two systems concerned unless consideration is given to the degree of distortion permissible with the receiving apparatus actually employed by the rival codes.

Mr. Cousins states that a single arm on the Baudot will give a speed of thirty words per minute, yet he knows full well and we all know, that the Baudot circuit giving more than half that output as an average working condition, does not exist, and it is the "average working condition" which is the most convincing.

If the object of Multiplex systems is to fill the line time with working signals, the selection of the Baudot as an example is not a happy one.

A feature of Wheatstone working which commends itself is the ease with which the circuit operations can be observed by the supervisors. A Wheatstone Transmitter can be seen working 100 feet away, and when stopped, the fact that no slip is passing over the platform, or that the slip is not moving, is obvious to everybody. The speed of a Wheatstone Transmitter can be gauged by eye, and providing slip is fed into the Transmitter continuously (a matter of simple organisation), one can be certain that work is being transmitted over the line at a known speed without the waste of a fraction of line time.

This is not the case with the Baudot. Some Baudot operators miss cadences, unintentionally, perhaps, but nevertheless they are omissions which are difficult to detect. Then again, the Baudot key-clerk has to stop to time her messages, and perform other little clerical details relative to manual working. The amount of line time wasted in these operations in astonishing when analysed, and supervisors who are interested in keeping their staff-hour averages as high as possible could study this aspect of Baudot working with advantage.

Mr. Cousins further states that a line which will work at approximately 85 words per minute Wheatstone Duplex should work 120 words per minute (normal speed) on Baudot Quadruple Duplex.

There is a Wheatstone Creed Duplex circuit now working to London, and carrying 10,000 five-letter words every hour (85 words per minute each way) with a total staff of 14, including a traffic supervisor at each end. The traffic on this circuit (mostly short messages) rarely falls below 5,000 words and occasionally rises to 12,000 words per hour.

Would Mr. Cousins, in the capacity of a telegraph engineer, seriously advocate changing this line over to quadruple Baudot Duplex in order to obtain a 30% increase in its output?

If so, would he please tell us what staff he would require? and what arrangements would he make to ensure that the full output of 30 words per minute was maintained on each arm?—Yours truly,

June 15 ARTHUR JAMES POLLEY.

The Telegraph and Telephone Journal.

PUBLISHED MONTHLY IN THE INTERESTS OF THE TELEGRAPH AND TELEPHONE SERVICE, UNDER THE PATRONAGE OF THE POSTMASTER-GENERAL.

Editing and Organising Committee - - - J. STUART JONES. JOHN LEE J. J. TYRRELL. W. A. VALENTINE. J. W. WISSENDEN.

Managing Editor - - W. H. GUNSTON.

NOTICES.

As the object of the JOURNAL is the interchange of information on all subjects affecting the Telegraph and Telephone Service, the Managing Editor will be glad to consider contributions, and all communications together with photographs, diagrams, or other illustrations, should be addressed to him at G.P.O. North, London, E.C.1. The Managing Editor will not be responsible for any manuscripts which he finds himself unable to use, but he will take the utmost care to return such manuscripts as promptly as possible. Photographs illustrating accepted articles will be returned if desired.

VOL. VIII. JULY, 1922. No. 88.

THE TELEPHONE GIRL GRADUATE.

TENNYSON'S oft-quoted prophetic phrase, "sweet girl graduates," has perhaps never before called up a picture of telephone switchboards or laundries, even though conducted on the most Utopian principles. Yet paragraphs with the above caption in *The Times* and other papers created considerable public interest in the early part of last month. The Savoy Hotel Laundry had advertised in *The Times* for a telephone operator, in whom courtesy, even temper and patience, coupled with a public school or university education, were the essential requirements. What appealed most to popular imagination was probably the fact that the offer of a position carrying £250 a year brought forth 800 applicants, a large number of whom were women graduates; but what is of more interest to our readers is the praiseworthy resolution of the advertisers to ensure that a competent brain was behind their telephone service.

By one of those curious coincidences, which do sometimes occur in real life, the advertisement referred to appeared in *The Times* on June 2, and on the same day in our contemporary, *Electricity*, appeared a series of paragraphs complaining of the vexatious delays the writer experienced in obtaining the desired department of a firm to whom he was telephoning.

"That the long-suffering and much-abused operator," he says, "is not always responsible for complaints levelled at the public telephone service of this country was brought home to me to-day, when, in a large northern city, I had occasion to call up one of the largest provincial branches of a leading electrical concern in this country."

He goes on to describe how he was switched on to four people in succession, only to learn ultimately that the goods he wanted were not in stock. Then, as though anticipating *The Times* advertisement, he continues:—

"Large firms do not attach sufficient importance to the intellectual and tactful accomplishments which go to the constitution of a private telephone operator. They are inclined to think that the job is only a routine one, and that any nicely spoken girl who can be relied upon to answer the fall of an indicator or the glow of a lamp signal will do for this function, and that when the board is not busy she can run errands or keep the firm's books and help out in half-a-dozen different ways. That is no kind of a solution of business telephoning. From the standpoint of outside clients, who, after all, are the more important from any firm's standpoint, the efficient telephone operator should be a personality: she is, in effect, a species of telephone hostess, receiving her employer's telephone visitors with an affable 'Yes, sir, and what can I do for *you*?' sort of air. She should be quick in her methods, and possess an invaluable capacity for soothing down irritation and ironing out trouble."

We adverted to the subject in an editorial in our April issue reiterating the truism that the subscriber plays as important part in the transmission of a call as the telephonist at the exchange, and it should be remembered that the subscriber, for all practical purposes, is the person who answers his telephone. We commend the example of the Savoy Laundry and, while the employment of "sweet girl graduates" is not imperative, we think that important firms owe it to their interest to ensure that their telephone is in charge of a competent and tactful person.

TELEGRAPHIC DEVELOPMENT.

IT is interesting to note in the *Journal Télégraphique* fairly complete statistical tables of telegraphic development for the first time since those relating to 1913. It is true that Austria, Russia, Italy, Bulgaria, Turkey, and Czecho-Slovakia do not furnish statistics for the year 1920, but with the exception of the first three all the principal telegraph-using countries are represented. The following is the development of wires in the larger States of Europe:—

Germany	2,362,023	kilometres.
France and Algeria ...	709,256	
Great Britain	470,148	
Poland	134,455	
Norway	131,224	(June)
Spain	117,878	
Hungary	80,405	
Rumania	73,178	
Kingdom of Serbs, Croats and Slovenes	71,526	

It would probably be found, if statistics were available, that Russia would take fourth, Italy fifth, and Austria sixth place. More than a dozen other States possess less than 50,000 kilometres of wire. On the other hand, if we regard the number of telegrams transmitted, Great Britain is first, France second, and Germany third, and the average number of inland telegrams per kilometre per year works out at about 139 for Great Britain, 67 for France and 27 for Germany, which seems to be a high testimony to the efficiency of the British wires.

It will be noted that some countries whose telephonic development is poor appear on the list of States with the largest mileage of telegraphs. On the other hand, Denmark, Sweden, and Switzerland, where the telephone development is high, have only

Digitized by Google

14,100, 44,515, and 33,365 kilometres of telegraph wire respectively. The area of Denmark and Switzerland is small and an extensive mileage is not to be expected, but this is not the case with Sweden, and there is no doubt that the universality of the telephone system in these countries affects the development of the telegraph unfavourably. It is obvious that to make a fair comparison the mileage of telegraph and telephone wire should be considered together, and then in relation to the population and area of the States concerned. But a difficulty arises, in that telephones should properly be considered in relation to population and telegraphs to area, because countries of vast extent require to be covered with a network of long lines, and again each telegraph line is in the nature of a trunk, while the telephone system requires a line for each individual subscriber. We hope at least to be able to give our readers a table of combined mileages of the principal States in an early issue.

HIC ET UBIQUE.

WE offer our hearty congratulations to Major T. F. Purves who succeeds Sir Wm. Noble as Engineer-in-Chief of the Post Office. Major Purves entered the service in 1889, became Assistant Superintending Engineer in 1905, Staff Engineer in 1907, and Assistant Engineer-in-Chief in June 1919.

As our readers may be aware arrangements had been made with the Dutch Administration before the war for the laying of a telephone cable between Aldeburgh and Domburg in Walcheren. The cable was actually manufactured, but it was of course impossible to lay it during the war, and it was used in 1917 to provide military and naval cross-channel connexions. In 1921 negotiations with the Netherlands were re-opened, with the result that a new Anglo-Dutch cable has been provided, which at the time of writing is in process of being laid. Telephonic communication with Holland should be an accomplished fact in the near future.

WE have observed before that the proposal of the Post Office to arrange the provincial sections of the telephone directory in one or two alphabetical groups for each section, was met by the objection that the subscriber would have to look through an inordinate number of Smiths in order to find the particular Smith he required. What would the objectors say to the Stockholm telephone directory, in which we note 66 columns of Anderssons, 63 columns of Johanssons, and 48 columns of Pettersons? It is interesting to find a considerable number of telephonists amongst telephone subscribers in Sweden.

As soon as we saw the heading "Telephone Girl Graduates" in *The Times*, we could foresee confusion arising in the public mind between the semi-secretarial employee actually referred to and the generality of exchange operators. Some of our more exuberant contemporaries have "gone in at the deep (or, we should rather say, the shallow) end." The *Sunday Express* foresees:

> Wanted.—Telephone Operators. Assyriologists preferred. No Astronomers need apply.

and asks: "What is to become of poor 'hello' girls now?" But there ought to be no 'hello' girls left by now according to Press prophecies. They were all promptly to disappear when an automatic exchange was opened at Hildesheim in 1908. We prophesy that 'girl-graduates' will prove a more chimerical menace to the telephonist than the automatic.

WE should not like to estimate at a guess the enormous increase in the number of telephonists employed in 1922 as compared with 1908, not only here, but all over the world. The Postmaster-General in his speech on the telephone vote, said that the head of the telephone system in the United States had told them that subscribers there preferred "jaws" to it, meaning the human voice at the switchboard. One daily paper reported this as "George" accompanied by the gloss that George was American slang for a telephonist. He said that the cost of instituting automatic plant in a complex system like that of London was at present prohibitive, so that the extinction of the telephone girls recedes into a still remoter future.

MAJOR T. F. PURVES, THE NEW ENGINEER-IN-CHIEF OF THE POST OFFICE.

In the same speech he stated that he had secured estimates for telephone development amounting to £35,700,000 for the next five years, and foreshadowed a total of about a million and a half telephones in this country by April, 1927. A resolution authorising the issue of £15,000,000 for the development of the telephone system was agreed to.

MR. VICTOR M. BERTHOLD, of the American Telephone & Telegraph Company, has kindly sent us a copy of his History of the Telephone and Telegraph in Columbia. The first telegraph line in the South American republic, was opened by an American Company in 1865, and the system was taken over by the State in 1869. It now possesses 20,597 km. of wire and 678 offices. Telephone service was started in Bogota in 1892 and the system acquired by an English company (the Bogota Telephone Co., Ltd.) in 1900. It now possesses 2,557 telephones. Various other private companies have opened exchanges in Columbia, which had a total of 5,935 telephones in 1920.

WOMEN IN THE CIVIL SERVICE.*

BY MISS L. M. HERRING (*Central Telegraph Office*).

(*Continued from p.* 145.)

Preferential Hours of Duty.

Some comment must be made upon hours of duty; the problem of attendances, as between men and women, arises only in the Post Office Department, and in so far as it adversely affects the attendances of men and the women's claim for equal pay, must be dealt with.

In the telegraph service men's attendances extend throughout the 24 hours. The proportion of women employed in an office is therefore a matter of serious importance, since women are, with few exceptions, precluded from the performance of duty after 8 p.m. or before 8 a.m. The women have no option, their conditions of service are not alterable, and the department have never offered equal pay with men on the condition of liability for all attendances.

To women desirous of bearing their share of the work of a public service the present position is unsatisfactory—they may not offer to perform all duties at their lower rate of pay, and the prospect of an agreement on the bigger question appears remote.

A proposal to exclude women altogether from work involving night and late attendances would not meet the position, because to bar them from work for which they are suitable would be merely to replace a disadvantage to men by an unjustice to women.

Personally, I hope that women will seize the opportunity when it comes—to take a share of the late and night attendances—the payment of a special allowance to men for such duties constitutes an alternative, but I hold the view that women would harm their demand for a recognition of their equality, if they cling to treatment which can be termed preferential.

The claims of the women may therefore be summed up under the following headings:—

1.—Equal pay (which will mean recognition of the value of their work and freedom from the reproach of undercutting wage scales).
2.—Equal opportunities.
3.—A just appraisement of work performed.
4.—Freedom of choice of occupation.
5.—Equal status and authority.

Retention of Married Women in the Service.

Another vexed problem concerning the employment of women which will sooner or later become prominent is whether or no they shall relinquish their appointments on marriage. Opinion on the question has not yet crystallised, but there are indications that the regulation which compels women to resign on marriage will at least be the subject matter for friendly debate in the near future, and for that reason it would appear to be desirable that some reference should be made to it, not as a question for immediate practical application, but as one of interest to all those who are watching the progress of women in these days of their greater freedom.

Advocates of the rescindment of the regulation are careful to point out that their attitude towards the matter is to ensure *freedom* of choice, and in no sense involves *compulsion* for women to remain at their service occupation after marriage. They contend that women have three important human rights which are:

1.—The right to freedom of choice of occupation.
2.—The right to choose to be economically independent.
3.—The right to give of their individual best in service to the community.

And that, to demand from them the surrender of these, or their retention only on the condition of celibacy is to impose on women an entirely unjust limitation. Such arguments merit consideration, and it will be found that many who would oppose such a change do so for practical reasons and not in disagreement with the general principle.

Interests of Men and Women.

In work which is performed equally well by men and women the question arises as to how it is to be allotted to them. In the mind of a private employer the problem would receive scanty consideration—he would simply employ whichever worked out the cheaper. But while it is true that the gentlemen of the Treasury are inclined to see eye to eye with the outside employer in this respect, it is also possible to conceive of an earlier change of heart on the part of Government Officials than will be allowed to the average industrial employer by the traditions of his class. It is possible, therefore, to consider the question in the belief that its solution on a higher basis can be looked for as a practical possibility.

To judge fairly upon the claims of men and women in respect of any particular work, or of a certain proportion of a large block of work, needs more than the average amount of care and thought usually expended upon kindred subjects. So far as any particular work is concerned it would appear to be a question mainly of special suitability with the important proviso that to both shall be accorded ample and adequate opportunity of proving their fitness. And even here, provided the difference in suitability was not of any extent, it would better meet the claims of both to allot the *bigger* proportion of the specialised work to the best fitted, rather than to debar one sex altogether.

Men and women hold in common certain rights—they claim equally the right to be economically dependent only on themselves—women assert with men their interest to maintain a recognised equal status in the work of service to the community—in varying degrees both sexes lay claim to the recognition of their obligations to support others; and without doubt, parents contend that they have a right to place their daughters as well as their sons in positions that would ensure reasonable security and happiness.

All things considered, the summing up would appear to be that under present circumstances the responsibilities of men must entitle them to a larger proportion of general work, but that neither sex should be prevented from performing services for which their capabilities are beyond dispute.

Taking the large view of the world's affairs, it is interesting to note some remarks made recently by Miss Maud Royden on the position of women a hundred years from now. She claims for women greater ability in administration and in powers of organisation, and for men specialisation in creative work. While it is certain there would be differences of opinion between men and women on their respective abilities, the broad division she indicates would at least give to both a reasonably equal importance. To reach absolute agreement on such a matter would not necessarily be desirable. Sex rivalry without sex bitterness is quite a healthy state.

Referring to her mention of administrative work, a case could certainly be made out that it contains at least points of contact in opportunities for initiative and quick action, with work within the definition of the word "creative." And a further point might fairly be made that women have always possessed creative power but have not been given sufficient opportunity or encouragement to secure its development.

Special Contribution made by Women.

But apart from the question of the interests of women and men, it is important to consider whether women give a special contribution to the community in their work as Civil Servants. Women, feel, and in my opinion rightly, that they have just cause for resentment against those leaders of the past whose teachings inculcated ideas on women which caused men to regard government of a country, and all kinds of public work, as the particular province of their sex, and from which women must be rigorously excluded. And when women regard the parlous state to which the application through generations of the male point of view, has brought us in 1922, it is not surprising that they feel that such a failure should be educative and that the remedy is obvious. While it can only be a matter of conjecture, many thinkers of to-day hold the view that if the naturally higher value which women place on human life had been given a chance of authoritative expression a century or so ago, there would not have been a great war in 1914.

If this be only remotely true it means that in all matters of importance to the community the contributions made by men and women have their particular and often different values. Different not in quality but in kind.

Much could be said about the value in service rendered by men, but it is the business of this paper to focus attention on women's work.

Without detriment to men, it can be fairly well substantiated that women bring the Service special powers of orderliness in the disposal of work; a high code of honour in dealing with others; an unwillingness to throw blame on other people; quickness and adaptability. In one particular they possess a definite advantage over men. They are not blind, through familarity, to the many evil practices which men unconsciously tolerate under the excuse of the necessities of business competition. To all the experiences of a less-sheltered life, the modern woman brings as a heritage from the past a clearer and purer outlook, the value of which cannot be over-estimated.

Not less in importance to women is the consideration of what a life of public service can give to them as a sex and as individuals.

To many the outlet provided by their admission into the Civil Service has meant freedom from irksome dependence on relatives, and the consequent vigorous growth of a real spirit of independence. They have discovered wider interests and their education in the duties of citizenship has been materially advanced. A business training with office discipline and restraint has helped to build up character and develop personality. In no sense can it be said that any of these attributes would be wasted should there be resignation from the Service. If women choose to marry it is fair to assume that their business training will contribute something of value to the work of training their children. If they do not, they have the knowledge that in their office work, a service is being given to the community that at all times has its own definite value.

Civil Service Efficiency.

To attempt a defence of Civil Servants from the attacks being made against them at the present time is not the special purpose of this paper, except in so far as a presentation of the work performed by over 60,000 women constitutes of itself a contribution in refutation of some of the charges made. In any case the *future* of the Service is of far more importance than the mere correction of misrepresentations, and it is upon that note and the relation between it and the problems concerned in the employment of women that a paper such as this should conclude.

The ideal to be aimed at is obviously a service comprising a body of men and women giving their best, and thereby building up a public service efficient in the fullest sense. They should not be expected to be super-human. There should be room, without disturbing its general fitness to function, for the harmless ordinary rivalies and differences which go to make up human existence. The special contribution which each sex can give should have freedom

* A paper read before the Post Office Telephone and Telegraph Society of London, on Feb. 27.

Digitized by Google

to attain to its highest development. There should be justice between men and women, and a firm comradeship which would not only strengthen and beautify the Service, but would wield an influence over the lives of all concerned.

To many such a service may seem impossible of practical realisation. To others nothing is impossible. Our sympathies and belief should be with the latter. Obviously nothing can be achieved if nothing is attempted, and a belief in the building up of a public service that could challenge criticism from whatsoever quarter it might come, is the first step on the road towards its realisation. And for women and men mutually to assist cannot fail to produce in the course of time the result we all desire.

REVIEWS.

"Electricity." By Sydney G. Starling. Longmans, Green & Co. 245 pp. 10s. 6d.

This work, which is one of the series "Science in the Service of Man," is an endeavour to impart to the general reader the principles of the present developments of electricity, without resorting to the aid of mathematics, by simple explanations of the physical processes involved. The book appears to us to be lucid in style, and is illustrated by 127 plates and clearly drawn diagrams, ranging from the familiar magnetic lines of force to curves of the transmission of vowel sounds, diagrams of Poulsen arc circuits and photographs of the path of a beam of X-rays. The ground covered includes chapters on the elementary principles of electro-magnetism, the dynamo and electric motor, the principles of alternating currents, electric lighting, telegraph and telephone, and a fairly exhaustive chapter on the electro-magnetic theory, containing a history and explanation of the development of wireless telegraphy and telephony from the discovery of the Hertzian waves, the progress made by Thomson, Duddell, Lodge and the invention or improvements of the thermionic valve by Fleming and de Forest down to the present. The concluding chapters deal with gases and X-rays and radio activity. The author makes no claim to give the latest forms and types of such apparatus or methods as may be found in the current press, but he certainly achieves his object in reviewing the whole field of electrical achievement and explaining the latest principles in a style which may be grasped by any intelligent reader. The book is supplemented by a useful glossary of electrical terms in general use.

"In One Man's Life." Being Chapters from the Personal and Business Career of Theodore N. Vail. By Albert Bigelow Paine. Harper & Bros., New York and London.

Most inventors require the aid of some enthusiast and organising genius to develop the full commercial value of their invention, and Graham Bell certainly found such a man in Vail, whose varied life is very interestingly told in this book. It must be confessed that the lives of financial magnates do not commonly furnish very entertaining reading even when their beginnings have been humble, but the work under review besides doing full justice to Vail's courage and ability presents a lively picture of American life from the 'sixties onward. It is full of interest not only to the telephone and telegraph man but also to our readers on the postal side, containing as it does much information on the organisation of the railway mail system in the 'sixties of the last century. The author begins the first chapter by saying: "This is the story of a man and a period with a somewhat inclusive background. We may call it history, therefore, rather than biography." We can admit that the claim is made good.

Theodore Vail was born in the State of Ohio in 1845, and after receiving a moderate education entered a drug store at the age of 17 as a clerk. Taking an interest in telegraphy, he obtained work in a telegraph office in New York, but, at the end of the Civil War, his father having decided to start a farm in the West, Theodore joined in the adventure. It is amusing to learn that during this period he conducted a village school in that prairie region, although, as his biographer is careful to point out, his English was poor and his handwriting bad. Desirous of making more money, however, he became a telegraph operator on one of the rough newly-opened Western railroads, where he experienced exciting incidents with hostile Indians and snowbound trains. He next obtained an appointment as "route agent" (a kind of travelling postal clerk) on the Union Pacific Railway. Vail devoted his energies to reforming and expediting the happy-go-lucky mail service which existed in those days. Letters were often weeks, even months, on the road. The postal employee had no particular geographical knowledge, and, holding his place by political appointment endeavoured to get through his work with the least amount of time and effort, and draw as much pay for it as his influence at Washington could command. His good work brought him under the notice of George S. Bangs, who, when he became General Superintendent of the Railway Mail Service, appointed Vail his assistant. An interesting account of their efforts to reform the Civil Service follows, and after several contests with influential members of Congress they carried their point. They succeeded in establishing a 28-hour mail train between New York and Chicago in 1875 by which letters were conveyed more speedily than passengers. Theodore Vail succeeded Bangs as General Superintendent the same year and found the cares of office exhausting. A new Congress proposed to cut down the rate of pay to the railways and the existence of the new and successful special mail was threatened. "Blatant and bone-headed reformers," says our indignant author, "had set up a yammer for economy and this was the answer." By playing off the Central against the Pennsylvania Company Vail managed to re-establish the special mail service. An interesting light on American senatorial methods is quoted. Vail applied to Congress for a special appropriation for his fast mail scheme. A senator called upon him and offered to get the Bill through if he were allowed a commission of 10 per cent. on the sum obtained. He got it—by agreement with the railroads. That is the only time, said Vail, that I was ever a party to anything approaching graft.

About this time (1876) Bell's invention created a sensation at the Philadelphia Exhibition—but nevertheless the telephone was considered by business men as merely a scientific toy. Hubbard, Bell's father-in-law and Thomas Sanders, of Salem, financed him in his experiments, and formed the Bell Telephone Company, but found it extremely difficult to attract capital. Hubbard managed to communicate his enthusiasm to Vail, to whose eternal credit it stands that his foresight and his faith in the new invention moved him to resign his office in the Postal Department and undertake the organisation and management of the struggling Bell Company. The Postmaster-General upbraided him with considerable warmth for his folly in throwing up his post for a "damned old Yankee notion," but Vail soon brought chaos into order, the company began to pay a dividend, business waxed rapidly, and by 1880 the value of the shares had soared to such a height that Vail was a comparatively rich man. No difficulties could stop the spread of the all-conquering telephone. Vail resigned from the presidency of the Company in 1887 to take a much needed rest, and the following years of his life were somewhat chequered. The failure of schemes which he had financed crippled his fortune, but ultimately the success of his ventures in Argentina brought him to a period of great prosperity.

In 1907 the affairs of the Bell Company had become somewhat involved and Vail was recalled to the Presidency. The success and enormous expansion which that great Company has achieved under his guidance need not be enlarged upon here. He lived to see the service returned from the temporary State control which was set up during the War to the Company's management. By this time the Bell system controlled 11,795,747 telephones. It only remains to add that the book is most readable and full of matter of extreme interest to all concerned in the telephone service. We wish that we could spare the space to quote particulars of the early struggles of the Company, the establishment of the first long-distance lines and the gradual and astonishing triumph of Bell's "scientific toy."

The Cable Room Monthly, new issue, is a bright little periodical providing matter of something more than local interest. Articles

Digitized by Google

entitled "Lead on Signals," now running, give some interesting details in the history of telegraphic development, as, for example, the following minimum charges to the continent when the first Anglo-French cable was laid, viz., London and Paris 19*s.*, and Liverpool and Paris £1 11*s.* 6*d.*! This little venture, we understand, is part of a scheme of constructive effort on the part of the U.P.W., and its contents should, generally speaking, most certainly prove helpful in creating a growing interest in the craft of telegraphy.

The second volume of Dr. Eugen Nesper's *Handbuch der Drahtlosen Telegraphie und Telephonie*, is now published, a hefty tome of over twelve hundred pages. The mere cataloguing of its contents would alone occupy more space than we can spare, but we willingly give prominence to the fact of the publication of this highly interesting venture.

LIONS IN THE PATH.

THE following extracts from the diary of a Provincial Postmaster may be of interest to some. In order that no clue may be given to persons and places, the dates, &c., have been altered.

Sept. 13.—Heard to-day that line to XY is now in good order, having been rebuilt! This should at last enable us to get the Quad into good working order. It is an unusual circuit, being ordinary Quadruplex fitted with sounders, but with addition of Wheatstone receiver on our side. It has never worked really well since it was put in, and the experts say that trouble has been due to line faults, and "superposed" sections. Must take interest in this now, because if the line is good at last, the thing ought to work, and if it doesn't, I must know the reason why.

Sept. 14.—The Quad won't work! Watched the experts trying to balance. They asked XY for R and got the Galvanometer needle to steady itself, while they moved A key, by putting resistances in Rheostat. That seems simple enough, and means that resistance of artificial line now equals resistance of real line to XY. Key working on four channels seems to be fair, but they say the B side signals come out on A side, and that when XY runs its transmitter, our Wheatstone slip is simply hopeless and that B sounder is unreadable, wonder why? and ask expert why he doesn't balance against transmitter current, instead of against ordinary key currents. He seems to be rather tickled at this, so I fancy I have put my foot into it! Must not let him see too plainly that I don't know much about it! Must look up Preece and Sivewright on point.

Had great discussion to-day on point whether a major irregularity becomes a minor, or even a case for commendation, when officer concerned says he was too busy to do work properly, and apparently expects praise, instead of blame, for making an ineffectual struggle against great odds. His estimate of greatness of odds is not same as that of casual observers.

Our new motor van is running well. Heard that drivers get medals (or something of the kind) if petrol consumption is kept at about 40 miles to the gallon; or if they invent any easy way of getting the thing to start at the first pull up; or anything of that kind. Must watch what they get up to!

Sept. 15.—Quad won't work, XY wants to know why. Tell them don't know, but propose special tests. Am now fortified by idea that we must overcome not only R, but something called K (short for "capacity"—don't know why they spell it with a K, but that is a detail).

Made special tests for two hours, XY after first failure tried other set of apparatus, and we got good results. Hoped that thing was settled, but XY said they must go back to original set, and did so. Don't know what they were up to at XY, but our Rheostat had to be moved about at numerous changes made at XY, until we were rather fogged. We made about a dozen alterations, and were lucky once, but XY made some other change, and off we went again!

Sept. 16.—Had another shot at the Quad. Told XY in reply to usual enquiry as to reason why we could not read on B side, that it must be their fault, as they would not let well alone. This seemed to give XY food for thought for they sent for engineer. He first of all gave us R, and we balanced against that. Then, to my astonishment, he said "here R and W." Experts puzzled to know what he meant, but guessed he meant to send transmitter current. My spirits rose after my set back on 14th! There was a difference in R and W, as compared with R alone, of 90 ohms in the Rheostat. Wonder if this difference is what upsets our working when attempt made to run full Quad. [Noticed curious kick in sounder to-day when balancing. Decided that condenser needed adjustment and tinkered about with it. Kick abolished. Evidently K needs watching as well as R.] Can't say that results were much better to-day—but am puzzled about curious observation made by engineer at XY. After giving us R, and then R and W, he said, "I will now put 90 in my 10 plug coil. Suppose he did so, but, if he did, result was not quite satisfactory. Quite clear, however, that he is trying to get rid of effect on our balance of change from key to transmitter working. We have to keep our Rheostat unchanged after balancing against R and W. That seems to be an advance. We have hitherto balanced against R alone, and have left Rheostat unchanged, but, of course, results have been bad. Trials suspended apparently because engineer had to catch a train!

Had great debate to-day about insurability of sub-postmasters. Read up a lot of Post Office circular notices on subject, and studied book of rules, now we must find out whether Sub-postmasters who have made declaration A have net income of £250 (including bonus) after providing premises and paying assistants.

Saw night mail out, must make note of date of Annual Report due in October.

Sept. 17.—Tried Quad again to-day, but did no good. Engineer had left his 10 plug coil behind, apparently, and must arrange next time to try effect of altering Rheostat when change made from key to transmitter working. That ought to keep our balance right!

Worried out to-day use of condenser and resistances on B side. The 50 ohms resistance prevents the discharge from the condenser from damaging the relay. The discharge from the condenser counteracts unfortunate effect of depression of A key on B sounder signals, and is helped in this good work by something called "self-induction" in the coils of the sounder. Gather that self-induction is a kind of disinclination to leave off work—quite unusual in the service. The resistances which can be adjusted are apparently intended to make the sounder speak up without becoming confused in its speech. This little side show interesting, but evidently not cause of our trouble. We get too many dots and dashes on our "slip" still, and now and then annoying gaps. Must be our condenser.

Sept. 18.—Took up the struggle again to-day. It is getting like the battle of Somme, for length, but is a good deal less harmful. We fixed up the condenser adjustment—fiddled about with the pegs till the last quiver disappeared from the galvanometer needle when we balanced, and did ditto with pegs in "retardation coils," a kind of ally of the condenser on the A side. Great triumph all round! We got a good balance. The engineer had his 10 plug coil and used it, so we did not need after all to meddle with our Rheostat after getting R and then R and W. We got the thing to work up to 70 words a minute on the receiver, and got good signals on the B side. We ought to get much more speed. Have now made fresh discovery! R and K are not the only enemies. "Self-induction," which is our friend on the B sounder, turns out to be an enemy on the A side. Have studied Preece and Sivewright Herbert, pamphlet for Skilled Workmen, and Technical Instructions, to see what his hostility needs. Gather that reluctance to cease work on part of coils of magnets in the Wheatstone receiver must be overcome by alteration of resistances in shunted condenser on A side. Very good diagram on this subject in Preece and Sivewright, &c.

If we can only induce the magnets to "speed up," we can get speed on receiver. Quite annoyed because Sunday labour has ceased in the Post Office.

The motor broke down to-day. Had cheerful half-hour watching postman overhaul his electrical bag of tricks and his carburettor. Found loose contact; tightened up nut; and the engine started.

Was nearly sold to-day over Rural Post case. Proposals put up at end of day showed travelling time over 6 hours! Must not overwork postmen, who do not suffer from "self-induction" as a rule.

Sub-postmaster called to know what would happen if he remitted cash to Head Office after banking hours. Strict orders that he must remit through bank, as he is our "accountable receipt" system. He doesn't want to keep a lot of money over night, and sometimes gets a lot after the bank closes. Told him to send it to Head Office, and "wait and see." Expect to get into hot water over this some day!

Sept. 20.—By altering resistances to-day in condenser on A side, we got Quad to work fairly well at 120 words a minute and reliably at 100 words a minute. This probably good enough, so will be content to let well alone for a bit. Had usual Monday morning trouble in balancing. Think this because clerk at XY has been changed through rotation, and does not know virtues of 10 plug coil.

Am wondering why when a Quad of this kind is fitted up, the Engineering Branch does not supply normal adjustment figures for Rheostat, retardation coils, condenser, and condenser resistance. If we had had normal figures as a guide, we could have made adjustments easily by working small variations. Must now write an essay for future guidance of overseer on duty here!

Now understand what Christian felt on his pilgrimage, when he met lions in the path, and found, on boldly walking up to them (with fear in his heart) that they were all held on short chains, and that they looked a deal worse than they really were.

Sept. 21.—Collapse to-day. Sudden new development. When transmitter is running at XY signals appear on our B side. Wonder why? Tell XY that his signals are bad when he is working on both channels at same time. He changes his key, but no good result. Evidently the adjustment at XY to meet change of total resistance when transmitter is in use does not quite meet the whole difficulty. But our A side is now O.K., so that is all to the good. Must now struggle with B side. How can we shut off unwanted current from B sounder: should we put in resistance between relay and B sounder, and switch it in and out when necessary?

Study Technical Instructions and Herbert as to construction of B side relay. Find that to clear A marks off B relay, the distance of armature from cores of magnet in the inside of the thing must be increased. Can we find adjustment which will meet working needs under both sets of conditions with which we are struggling?

Digitized by Google

Sept. 22.—Found to-day that armature of magnet in B side relay would stand movement away from cores to meet needs pretty well. Will watch results for day or two. If we cannot get one relay to do all the work, must suggest that two relays be fitted—one to work with key currents, and other to work with the different current which we receive when transmitter and B side are both working.

Begin to wonder how engineers sleep at nights. They must have solid constitutions. Will not be able to do much more for a few days with Quad beyond watching progress, as am now overwhelmed with papers about education of boy messengers, sub-office scale payments, sub-office surveys, &c., but have had a most interesting time so far.

THE BAUDOT.—XXXIV.

BY J. J. T.

IN the two or three articles which still remain to be published, it is intended to touch upon certain developments of the Baudot system. The first of these was introduced by Mr. Donald Murray, to whose courtesy I am indebted for the original prints from which our artist has produced the four black and white sketches, which

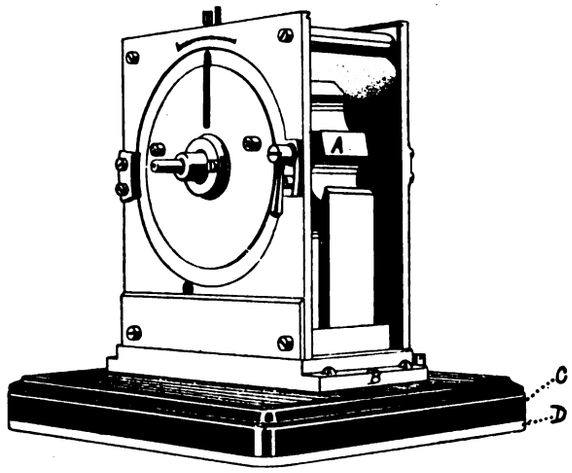

FIG. LXXXI.

now follow. Fig. LXXXI shows this, the phonic wheel and motor A, as fitted inside an ordinary Baudot distributor casing, from which the usual extended axle and governor and all the internal gearing except the epi-cyclic and correcting mechanism have been removed. A cast-iron metal base B (Figs. LXXXI—LXXXIII) is provided and screwed to a polished wooden stand C to the under side of which is fixed a pad of felt D. Figs. LXXXII—LXXXIII give side and full views respectively.

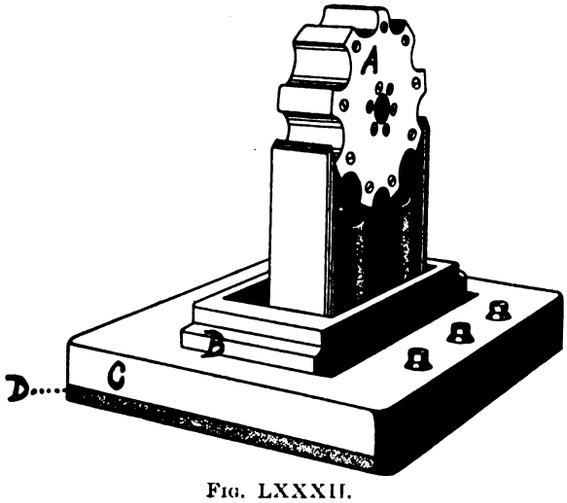

FIG. LXXXII.

The phonic motor consists of a cast-iron wheel and two electro-magnets. The inside of the wheel is grooved, the groove being filled with crumpled iron wire and mercury to produce absolute steadiness of running. The whole is covered by a circular plate fixed by means of a dozen screws. The motor is designed for a maximum speed of about 300 revolutions per minute. The rotary movement of the wheel A is governed and driven by a vibrating reed, one end of which is fixed to an iron base. The vibration

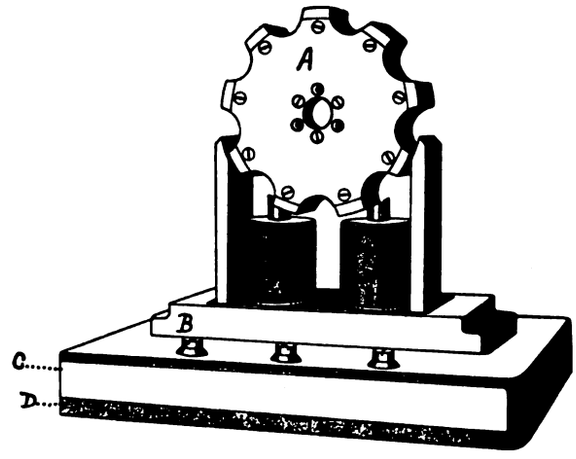

FIG. LXXXIII.

of this reed between two contacts alternately energises the electro-magnets of the phonic wheel, the progression of the latter being determined by the rate at which first one and then the other of the electro-magnets is energised and first one and then the other of the twelve "teeth" of the wheel are successively attracted. The action of the crumpled iron wire produces sufficient interior friction to give the mercury a hold on the wheel, while the mercury adds to the inertia of the wheel, practically converting it into a fly-wheel.

(To be continued.)

OUR BOYS.

THE closing meeting of the Gymnastic Class of the "G.P.O. Messengers' Institute," held at Throgmorton Avenue on May 26, was presided over by Sir William Noble, who was accompanied by his daughter, Mrs. Gisborne, and supported by an enthusiastic company including parents and other friends of the boys. Medals, the gift of Mr. W. T. Leech, were handed to the winners by Mrs. Gisborne. The Institute, said Sir William, shows the Department's interest in the welfare of the boys. In his early days nothing at all was done for boy messengers, and only those boys who had ambition attended evening classes. Happily things had changed, and he felt sure that the boys would repay the Department for the interest taken in them.

The novel feature of the evening's entertainment was that it was provided entirely by the members of the Institute. The Instructor led his team through creditable performances on the horizontal bar, parallel bars, vaulting horse and pyramids. Messenger Coe recited, Messenger Braben sang (accompanied by Mr. F. G. Price), Messenger Lambert gave a violin solo, and Messenger Lovejoy extemporised with the Indian clubs. Great interest was shown in a new turn called "Institute Pastimes," one of which, "skinning the eel," provoked much mirth, as also did the tumbling and Japanese wrestling. The surprise of the day was the appearance of an "Institute Orchestra," which acquitted itself with such skill as to win a vociferous encore. The visitors expressed unreserved pleasure at the display given, both athletic and artistic, and the whole-hearted manner in which the boys took their part gave eloquent testimony to the popularity of the versatile leader, Mr. Keay. We know of no tonic like a night with the boys of the G.P.O. Institute. In responding to a vote of thanks, Sir William Noble generously promised to present two prizes for competition next year.

THE TELEPHONISTS' COLUMN.

"TALK OF MANY THINGS."

FOR some time consideration has been given to a proposal to introduce a new feature into the JOURNAL, with a view to bringing the telephone staff in London and the Provinces into closer touch with each other by the exchange of items of information of general interest to the exchange staff as a whole.

Through the courtesy of the Editor, a column has now been set aside for the purpose, and it is hoped that supervisors and telephonists through the country will contribute to it. It is unfortunately impossible for us to have personal association with all our colleagues in the Provinces; we cannot all meet; the most elaborately organised "rally" of the operating staff, even if it were practicable, would be only very partially representative. But in this column, each one who contributes has an opportunity of talking to all her colleagues, and in this way we may extend the circle of our comradeship to include many beyond our local acquaintances in the Service. "C.N.B." in "An Apology," quoted below, says, "I read every word of the *Telephone Review*" and got lots of tips about difficulties galore that I never dreamed of!" Let us have those tips. Let us hear of the difficulties experienced, incidents in the local Exchange life, or subjects of wider reference to the whole Service which you notice or read about. "Is it not knowledge," says Bacon, "that doth alone clear the mind of perturbations?" It is the hope of the writer that this column will be the means of at least minimising some of the "perturbations" encountered, and of bringing us into closer sympathy with each other.

Since this is the inauguration of a column devoted chiefly to feminine interests, it is appropriate, perhaps, to begin on a sympathetic note, and to print some thoughts that were suggested after reading Miss Dorothy Turner's plaint, "I have been late."

TO MISS DOROTHY TURNER.

You have been late! That fact I'll not deny,
Nor rigid punctuality decry;
But those who judged, and sent you to your fate—
Have *they* been late?

You have been late! The radial cannot lie,
Yours to repent; yours not to reason why;
But are Attendance Books inviolate?
Have they been late?

You have been late; of cash have been bereft
If you were judge, how much would *they* have left;
Unholy thought! Who then would dare to state
They have been late.

You have been late. Time, tide, the Motor Bus,
Will not turn back for any one of us,
And e'en Canute—no more I'll hesitate,
They *have* been late!

From an American contemporary. London papers, please copy!

DEAR SIR,

Ever since I was a kid
Old enough to use a telephone
I have thought telephone operators
Were a bunch of dumb bells;
And the first thing I learned
About the telephone
Was to kick about the service.
And I always thought
The best jokes in the papers
Were the ones about operators
And wrong numbers
And busy wires
And etc.
But last summer
I went to the mountains
For a vacation
And I met a young lady
Named Carrie,
And I thought to myself:
"What a mighty pleasant creature,
And what a smile!
And also what a voice!"
So when I found out
She was a telephone operator
I thought, "Gee!
At last the voice with the smile."
And she told me
How she liked her work
And some things about it
And about the girls
At the Central office,
And I began thinking
That if they were the boobs
I always thought them to be

AN APOLOGY.

A girl like Carrie
Couldn't rave about them;
So when I got home
She sent me a copy
Of the *Telephone Review*
And I read every word
And got lots of tips
About difficulties galore
That I never dreamed of;
And kept on thinking
The thing over
And remembered
That in everything else
One mistake in a hundred starts
Is considered
A good average;
So I just kept track
Of my telephone service,
And I must admit
That I'm the boob
I thought the operator was,
And every time
I take down the receiver
And hear the cheerful voice
I now always
Recognise the smile
And want to apologise
For my past thoughts
And words;
And won't you let me
Through your magazine
Tell every operator
That I'm sorry
AND SHE'S WONDERFUL?

Yours truly, C. N. B.

Contributions to this column should be addressed: THE EDITRESS, "Talk of Many Things," Telegraph & Telephone Journal, Secretary's Office, G.P.O. (North), London, E.C.

LONDON TELEPHONE SERVICE NOTES.

Messenger Boys' Institute.

THE writer was privileged to attend the annual Prize distribution and Gymnastic display at the Messenger Boys' Institute at Throgmorton Avenue, on Friday, May 26. In the past it was the practice for the boys to give the displays and for visitors to provide the musical items, but on this occasion the whole programme was given by the boys, and well they acquitted themselves. Under the direction of Mr. Keay, their energetic and enthusiastic instructor, the boys gave a splendid display on the horizontal bars, parallel bars and vaulting horse. Not the least active boy was one we will call Peter Pan, because, at the early age of 16 he stands in danger of being retired because he does not grow up to the requisite height.

The chief item of the musical programme was the first performance in public of the Institute Orchestra, which had been started by the boys on their own initiative, but they roped in Mr. L. Prossor of the Traffic Branch as a coach, with the result that they put up a very good show. A better combination than physical exercises followed by music as recreation for the boys, would be hard to find.

Lady Noble was, unfortunately, not able to be present to distribute the medals, but in her absence Mrs. Gisborne officiated. Sir William Noble, who presided, spoke well-chosen words of advice and encouragement to the boys, and in token of his last attendance at an official function in his capacity as Engineer-in-Chief, promised two prizes for next year's event.

* * * *

Revision of Telephone Charges.

The revised charges which come into force on the 1st of the month can be summarised into a short paragraph, as indeed they were in a recent issue of the JOURNAL, but this gives no idea of the activity behind the scenes. A revision of charges increases the work of all branches enormously, the brunt of it falling upon the Accounts and Traffic Branches. The current work must, of course, go on, but preparation has to be made in advance for concessions to subscribers to be passed on to them by the time they are due. In the Accounts Branch the ledgers and installation cards have to be amended to allow for reduced rental and mileage charges where applicable, and all adjustments have to be carefully scheduled for audit purposes.

In the Traffic Branch preparation has to be made to instruct the operating staff in time for the new conditions to be understood. Call office attendants have to be instructed and many others who attend to the public, at large and small Post Offices all over the town have to be informed of the new conditions.

It is probable that the reduced afternoon rate will encourage subscribers to hold over unimportant calls from the morning. It will be interesting to watch the traffic returns to see to what extent this is done. If it occurs to any great extent, it will have far-reaching effects on equipments and staffing problems.

* * * *

L.T.S. Swimming Association.

In order to cater adequately for its large membership the L.T.S.S.A. have arranged for two galas at the end of the season, to be held on Sept. 15, and Oct. 6, at the Pitfield Street Baths, Hoxton. The reason for changing the venue this year is due to the necessity for providing increased space for spectators. Another drawback which will be overcome is the engagement in several events on the same evening by the same competitors. So keen are all concerned to put forward their best in the championship events that in the past there has been considerable risk of the best swimmers becoming over-fatigued.

* * * *

"Maryland."

Some of us have probably been struck by the strangeness of the name "Maryland" for one of the exchanges recently opened in the London district, and have been led to wonder as to its origin. Maryland, Stratford, was in all probability named after Maryland State, U.S.A. Maryland Point is a cluster of houses near Stratford. The first ones were erected by a merchant who had a fortune in Maryland, U.S.A., and from that colony it is stated, they took their name.

So far as Maryland, U.S.A. is concerned, the name "Maryland" (Terra Mariae) was bestowed upon the colony by Charles I. in honour of his Queen, Henrietta Maria.

The Charter of Maryland, which constituted the first proprietary government established in America, was obtained from Charles I, by Sir George Calvert, first Lord Baltimore, who had been one of the principal Secretaries of State to James I. Lord Baltimore died before patent passed the Seals, and it was issued to his son, second Lord Baltimore, June 20, 1632.

In 1633, Lord Baltimore dispatched a number of emigrants under command of his brother, Leonard Calvert, to colonize the territory. They settled at St. Mary's on March 27, 1634, and the first legislative assembly met February, 1635.

Digitized by Google

The Baltimores were Catholics, and Maryland was designed to be a place of refuge for English Catholics; but from the earliest period religious toleration for all Christians was proclaimed and practiced.

Maryland has always claimed the honour of having been the first Government in which liberty in matters of faith was established by law.

* * * *

Culled from the Exchanges.

Items under this head are not so numerous as usual, and it may be that the drought is responsible for the small crop. The compilers of these columns are anxious for contributions to be sent along from the exchanges regularly, if possible, although they do not go so far, of course, as to suggest that functions should be arranged for their special benefit so that notes shall be forthcoming.

Hop Exchange.

A very successful outing was given to 190 poor children by the staff at Hop, on Saturday, May 27. The children, who were drawn from the Mint Mission, Borough, the Ragged School Mission, and the Lycett Mission, East End, were taken to Chingford by char-a-banc, where a good substantial tea was provided at Rigg's Retreat.

After tea, races were arranged, where the competition between the schools caused some amusement.

It is always a great pleasure for the Hop staff to have their old chief with them, and on this occasion Miss Ashmead kindly consented to give away the prizes. The Children's Outing Committee wish to thank Mr. Beaumont and Mr. Law for the valuable assistance they rendered, and take this opportunity of thanking members of the staff who attended and the Superintendents of the schools for their help.

* * * *

Regent Exchange.

MONDAY MORNING.

Oh, the sun is warmly shining just the same as yesterday,
And the trees, I make no doubt, are just as green,
Along the lanes they border, all aleaf down Richmond way,
With the river glimpsing silver in between.

But it might as well be pouring hail and sleet and snow and rain,
And the birds might croak and trees turn drab and gray,
For I'm slogging hard at work and saying "Number please," again,
Just as if there'd never been a yesterday.

Oh, it's base ingratitude to talk in this way, I suppose,
And I guess I'll just get used to it again,
But the week-end seems to spoil me for the job of "dousing glows,"
And I'm full of little moods I can't explain.

It started from the moment when I reached the switchroom door,
As I sniffed again the grim, official smell,
And I trod the dark stone stairway which I've trod so oft before,
And which leads to regions very near to —— well!

When I donned the same old instrument and ragged switching gloves,
And otherwise prepared me for the fray,
For it's *work* I'd got to think of, not the little joys and loves
That make yesterday so different from to-day.

Don't you see? It's Monday morning and I'm "fed up" to the teeth,
As You all know what it is--you've lived it too!
But the proper sort of spirit's lurking somewhere underneath,
So I'm going to "buck me up" and help it through.

DOROTHY TURNER.

A LAMENT.

TO A SUPERVISOR UPON BEING TRANSFERRED TO ANOTHER EXCHANGE.

Our Supervisor now departs,
Weary are our broken hearts.
Ah! now we say with many a tear,
"To those who knew thee, thou wert dear."

Subscribers often used to "straffe,"
Then thou would'st cheer us with a laugh.
Now when of thee we sit and think,
Our spirits down to "zero" sink.

We cannot now thy features see,
We miss thy smile at the "I. D.,"
The silv'ry sweetness of thy voice,
That used to make our hearts rejoice.

Perhaps we'll meet thee in that land,
Where telephones soil not the hand.
No supervisors then we'll need,
But on thy love and laughter feed."

G. M. TURNER.

LONDON ENGINEERING DISTRICT NOTES.

The Engineer-in-Chief.

SIR W. NOBLE, who in the course of his career served both as Assistant Superintending Engineer and as Superintending Engineer in the London District, handed the chains of office on May 31 to his successor, Major Purves. There can be no doubt that the Engineering Department as a whole is delighted that Major Purves has been honoured by promotion to one of the premier positions, if not the premier position in the engineering profession in this country. It is a work of supererogation to paint a lily and it is sufficient to wish the new Chief every success in his new position and to assure him of the loyal support of every member of the engineering department.

Contracts.

The policy of the department is that certain classes of work shall be put out to contract. The reasons for such a policy need not be detailed here, but certainly there is no doubt that the work could be done quite satisfactorily by the Department's own staff as has been proved in several instances. The policy, although it results in a smaller permanent staff of workmen than would otherwise be required, places upon the engineers a considerable amount of work and responsibility in connexion with such works.

The following are some particulars of procedure relating to contracts:—

Lists are held of approved firms willing to undertake contracts for Post Office works, and invitations to tender are issued when the "lay out" of plant has been approved and funds are known to be available. The Department's form of tender and contract for underground work is a printed document of 44 pages. It embodies the Conditions of Contract, and a specification comprising five schedules indicating the scope of the work and the manner in which construction shall be carried out, and it allows for the insertion of rates which the contractor proposes to charge for specified items of work to be carried out under given conditions. Drawings explanatory of the details of pipe and conduit laying and jointing chamber construction are supplied.

A contract is created by the acceptance of an approved signed tender by or on behalf of the Postmaster-General.

The charges for the work are brought to account by means of day to day certified entries in a diary which is kept on the work. The diary entries are summarised by the contractor and carried into priced accounts, which are rendered to the Superintending Engineer. Payments on account as the work proceeds and a final payment upon completion, are made in accordance with a payment clause in the contract. Certificates for payment in respect of work completed are given by the Superintending Engineer and by the Engineer-in-Chief, and warrants in accordance with such certificates are forwarded to the contractors by the Accountant-General.

One of the duties of the engineer during the progress of a contract is to satisfy himself by an inspection of the contractor's wages sheets, that the "Fair Wages Clause" of the contract is being faithfully carried out.

The work is kept under constant supervision on behalf of the Department in order that it may be ascertained that the rate of progress and quality of work are satisfactory. Every portion of the work is checked to ensure that it is in accordance with the specifications and drawings or patterns.

During the financial year contracts were let in the London Engineering District involving payments to contractors of a sum approaching three-quarters of a million pounds.

Among the larger works completed during this period may be mentioned the London portions of the London-Manchester, London-Southampton, London-Barnet, London-Brighton, London-Weybridge, and London-Uxbridge main cables. Heavy duct routes have been laid in such important thoroughfares as Ludgate Hill, Gracechurch Street, Fenchurch Street, Eastcheap, and Mark Lane in the City of London, and a considerable mileage of conduit has been provided throughout the various sections of the district.

Despite labour and transport difficulties hampering manufacturers, exchange equipments or extensions have been completed and handed over by the various contractors at Avenue, Clerkenwell, Harrow, Hornsey, Lee Green, Maryland, New Cross, Streatham, Toll and Willesden. Exchange equipments at present in the hands of contractors include Barnet, East, Gerrard, Hop, Ilford, Tottenham, Walthamstow and Wembley. An interesting work about to be undertaken by contract is the adaptation for receiving Post Office cables of the brickwork and steel tube, lately the property of the Pneumatic Despatch Company, which runs between the G.P.O. building in Newgate Street and Euston, *via* Holborn and Tottenham Court Road. On April 12 the Postmaster-General presented to the House of Commons "a Bill to confirm an agreement made between the Pneumatic Despatch Company, Limited, and the Postmaster-General for the acquisition by the latter of a certain tube running between St. Martins-le-Grand and Eversholt Street in the Metropolitan Borough of St. Pancras, and for purposes connected therewith." The measure was read a first time. This tube has been derelict for a number of years and when restored will prove a valuable addition to the Post Office underground system.

"Where the Rainbow Ends."

Youths seeking employment in the present year of grace frequently have, owing to restriction of employment, many disappointments before they obtain an appointment. But they are, generally speaking, better equipped for

Digitized by Google

life's struggle than their progenitors. It is painful to those whose duty it is to have to inform promising youths that there are no vacancies, especially when the applicant is convinced that he possesses a rudimentary bâton which he is certain will act as a magic wand and carry him swiftly to a position in which he can wield it as a fully developed emblem of authority. Such a youth is evidently one who wrote as follows :—"What I desire to impress upon you is, I do not want a big wage, but only a chance to improve myself, just a little start at the bottom rung *and the rest may be left entirely to me*"

Awards For Suggestions.

The 50th list of awards has been published, and it is gratifying to note that members of the London Engineering District take nine of them. Five of the suggestions refer to telegraphs and four to telephones. The recipients have a much greater reward than is expressed by the cheques, namely, the feeling that they have contributed something to the improvement of the service that is of such value to mankind. They are, in fact, public benefactors

Wireless.

At the present rate of progress it will soon be difficult to find anyone who has not taken out a licence for the reception of wireless signals. It is natural that members of the Engineering Department should take an interest in this subject as they certainly are doing, judging by the large number of applications for permits. Demands are also flowing in at an ever-increasing rate from members of the public. People who don't know the first thing about electricity and magnetism are beginning to talk glibly about wave lengths and close couples. It is to be hoped that the interest in wireless will not meet the same fate as other inventions of the *Daily Mail*, the *Daily Mail* hat for instance, which is as scarce as a halfpenny daily paper. By the way, is it not time that the *Daily Mail* was reduced to its pre-war price of one halfpenny, or are the expenses of producing a paper in the interests of economy on the part of others too great?

Pneumatic Tubes.

According to "Scientific American" sending telegrams by compressed air is the latest innovation in American telegraph methods. Greater speed and efficiency and perfect accuracy are the reasons given by the Western Union Telegraph Co., for its recent expenditure of millions of dollars in building underground pneumatic tubes radiating from its central operating rooms to its numerous branch offices in the larger cities of the country. The tubes are of copper encased in creosoted wood ducts. If readers will turn to the November, 1921, number of this JOURNAL, they will obtain some particulars of the pneumatic tube installation in London. The system has been in use in this country for very many years.

Atoms.

Professor Rutherford's *Kelvin Lecture* on the Constitution of the Atom has engendered in one student a desire to make a detailed study of the subject. As a first step he is making a collection of relevant literature and has already purchased Marie Corelli's *Mighty Atom* and *Secret Power*.

Making a Water Reservoir Speak.

For many years water engineers have been experimenting with apparatus which would automatically indicate to the responsible officer who may be stationed some miles away the level of water in each reservoir. A number of systems are in use, and have met with varying degrees of success.

A disadvantage of most of the existing systems is that the height of the water is shown on an indicator located at a particular point, and that if no one is permanently stationed at the point where the indicator is situated, a special journey may be necessary in order to ascertain the state of the reservoir.

A system is now upon the market in which the use of a gramophone in connexion with a water float and a line to the public exchange, connected up in the same way as an ordinary exchange line, will permit any water official to make a call to the allotted exchange number and to receive information as to the exact height of the water without any human intervention except that of the exchange operator.

The operation of the system is briefly as follows :—

A water-float at the reservoir connected by a system of cords and levers to the needle of a gramophone and the movement of the float causes the gramophone needle to travel in a horizontal plane over the disc. Normally the gramophone disc is still and the needle is not in contact with the disc. The gramophone is connected through an induction coil to a public exchange circuit to which an exchange number is given. The insertion of a calling plug in the exchange number causes the disc to revolve and brings the needle into contact with the disc. The disc is engraved with various words such as "Reservoir Empty," "Reservoir Full," "Water 24 feet," &c., and these words are repeated four or five times.

The actual words heard will depend upon the point at which the needl is brought into contact with the disc and this again will depend upon the height of the water.

It is said that the clockwork only needs winding once for each hundred times that the machine is operated.

The idea of using a gramophone in conjunction with a telephone is not new, but this particular application is novel.

If the experiment is entirely successful an extensive development may be expected. For instance, how comforting it will be for the man at a club to realise that the machine at his office can be relied upon to say, "I really must finish these accounts, dear, but expect to be home about 11.30," with suitable variations for subsequent calls.

THE ANGLO-CONTINENTAL SERVICE IN 1922.

BY H. W. CAMP (*London Trunk Exchange*).

THE use of amplifying relays usually known as repeaters by the various European administrations, has pretty well solved the transmission difficulty which was at one time a very big problem in long distance telephony.

The success of the London-Genoa service during the recent International Conference opens up great possibilities, and if the various countries can find the money for the lines and repeaters, there will be a tremendous increase of international telephone traffic, and this country will occupy a very important position in relation thereto.

At the present time the London Trunk Exchange has 12 lines to Paris, 3 to Brussels, 2 to Antwerp, and one each to Calais, Boulogne, and Lille. Two of the Paris lines have repeaters inserted between London and Paris, and the two Antwerp lines have repeaters at La Panne. Swiss traffic and most of the French provincial traffic is circulated *via* Paris where repeaters are employed for all long distance through traffic.

The traffic characteristics follow very much the lines of the British trunk traffic—ordinary business calls, Stock Exchange calls and social calls, the latter mainly in the evening, but in addition there is a very considerable amount of Foreign Exchange traffic. It may be easily imagined that considering the fluctuations in the various continental currencies and the eagerness of all interested to profit thereby, the lines to the Continent are not idle for lack of work. All this means, of course, that during the business hours of the day we are overwhelmed with work, and delay becomes considerable.

Four Paris, 2 Brussels, and 2 Antwerp lines are put through direct to the respective Bourses and these lines take all the Stock Exchange calls and the majority of the Foreign Exchange calls. The Paris Stock Exchange (Bourse des Valeurs) is open from 11 a.m. to 4 p.m., and the Foreign Exchange (Bourse de Change) from 1.30 p.m. to 4 p.m. Brussels is open from 1.30 p.m. to 4 p.m. and Antwerp 2 p.m. to 4 p.m.

Calls to the French provinces *via* Paris are mainly for places in Alsace and Lorraine, particularly St. Louis, a suburb of Bâle just inside the French frontier. This frontier suburb appears to possess a peculiar attraction for many business people, and it will be interesting to watch developments in this quarter.

As previously mentioned, all Swiss traffic goes *via* Paris, and London traffic takes its turn at Paris with waiting French traffic. Communication to any part of Switzerland is good, but most of the traffic is of the business type. During the evening there is no delay to Paris and very little between Paris and Switzerland, so that calls between London and Switzerland could be effected almost without delay.

The bulk of the Belgian traffic is also effected during the business hours of the day when we are "full up," but we can give a "no delay" service after 6 p.m. on the Brussels and Antwerp routes. At the moment communication with Belgium is limited to Brussels, Antwerp, Liege, Ostende, Ghent, and Charleroi. No doubt additional traffic will have to be handled when the whole of

Digitized by Google

Belgium is open to the service. A modified form of continuous attention is in force on Paris, Brussels and Antwerp, and excellent paid time results are obtained.

The night service hours are from 9 p.m. to 7 a.m. in summer, and 8 a.m. in winter. During the night period we have ordinary and *abonnement* calls. The latter are somewhat similar to the fixed time calls of the inland service. The call is connected at the time required by the subscriber. The minimum duration is 6 minutes per night for one month with either a reduction of the day rate or double time at the single day rate. This service is used by the newspapers and Press agencies.

It is probably known that French is used for operating purposes at all times. The staff is at present recruited from telephonists in the London Telephone Service who, in the case of day staff, have completed 6 months' service in a local exchange. They are tested in French by Trunk Exchange officers, and if found satisfactory or considered worth a trial, are given 3 months' training in the Foreign Section. If at the end of this period they are considered efficient from the language and operating point of view, they are certified as elegible for the language allowance. It appears that there are very vague ideas in existence about the standard of French required, and it may therefore be useful to give some definite idea of our requirements.

The language test is for the purpose of finding out how much the candidate knows about the language, and how much more she is likely to know. Each candidate is examined separately, and there are never more than three people present. The examiner wants the telephonist to talk and to keep on talking about anything. The choice of subjects is unlimited and certainly no objection will be raised to "hats" or "the skirt question."

Attention is given to clarity and facility of expression as well as to correct grammatical construction of sentences. Don't be afraid of mistakes, the examiners are accustomed to them and not infrequently they add to the joy of life. On one occasion a candidate said that he liked the books of a well-known author. He was asked why, and replied to the lady examiner "Parce que je t'aime." The necessities of the Anglo-Continental service require a fairly high standard, and the department has the right to expect it. It is hoped that the examination will shortly be placed upon a broader basis to give greater satisfaction to all concerned.

It should be understood that there is no time to teach French at the positions during the 3 months' trial. Operating phrases have, of course, to be learnt, but the candidate is expected to prove what practical use she can make of the language as a telephonist. Difficulties have to be explained and subscribers assisted on the continental lines even more than on inland lines.

There is plenty of work between 9 a.m. and 6 p.m. and it is more trying than inland operating. Some relief is afforded by the clerical work which includes the preparation of daily and monthly revenue and traffic returns, replies to written enquiries *re* complaints from Continental subscribers. The complaints are made to the administration concerned, and a statement is then sent to the London Telephone Service by that administration so that we do not get the benefit or otherwise of any observations on the service that the complainant may have made.

The possibilities of the Anglo-Continental service are very great. The traffic is waiting, but we require lines. There will shortly be a direct service to Amsterdam, which opens possibilities of use for Anglo-German traffic. It will probably be inadequate even from the outset, but it will be a beginning. The point can be put in a few words. If 14 lines are insufficient to meet the requirements of a country 25 per cent. industrial, how many lines will meet the requirements of a country 75 per cent. industrial, even if the traffic is indirect ?

The French administration advertises a service to Rome *via* Turin, Barcelona *via* Cette, and to Breslau *via* Berlin. May we not hope that we shall soon be in a position to do the same ?

A problem that might usefully be taken in hand is the one relating to international operating procedure. The rules vary in each country, and there is no doubt that unification would materially help and result in increased revenue. Perhaps the 1924 Conference will do something in this direction.

The biggest problem in international telephony is that of frontiers. There are about 30 separate administrations in Europe, each with its own system. One day we may have a central international telephone authority for the whole of Europe with power to make decisions and authorise expenditure. With such an authority the possibilities of international telephony are greater than ever.

A few up-to-date traffic figures relating to the Anglo-Continental service are appended. Calls are considered in terms of "units," *i.e.*, periods of 3 minutes. On the total traffic the incoming is higher than the outgoing. This is partly due to the low exchange rates of Continental currencies and partly to the longer business day.

A comparison of the monthly totals of traffic show an all-round increase.

	July, 1921.	*April*, 1922.
Outgoing	14,212	15,515
Incoming	19,677	22,834
Total	33,889	38,349
Per cent. lost time due to faults ...	28	28

The increase in Anglo-French provincial traffic is seen by comparing the following monthly totals :

	July, 1921.	*April*, 1922.
Outgoing	1,364	2,074
Incoming ...	2,027	2,861
Total	3,391	4,935
Per cent. lost time due to faults ...	28	28

THE BAUDOT—XXXV.

By J. J. T.

FIG. LXXXIV gives a view of the vibrating reed FH which governs the phonic motor wheel shown in the previous three figures. The reed is fixed at F and is loaded at its free end by a sliding weight W capable of adjustment along the end H, its position being fixed by the capstan-headed screw S. The vibration of the reed between the studs K and K^1, and in front of the electro-magnet coils E, is first started by hand. A spring stud J is joined in circuit

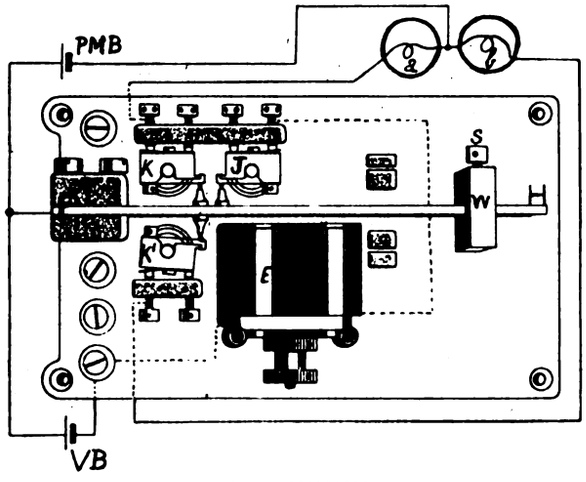

FIG. LXXXIV.

with the electro-magnet E, the vibrating reed battery VB and to the vibrating reed itself by a teed connexion at F, so that when FH rest against J a current from VB energises E and attracts FH towards the latter, breaking the circuit J, E, VB and F. In so doing FH makes contact with the stud K^1 completing a circuit through the coil *b* of the phonic motor and the motor battery PMB causing the phonic wheel to move forward one step. The reed being in vibration swings back again to K and J, thus closing the circuit through the coil *a* of the phonic motor and moving the phonic motor wheel forward a second step. Following immediately upon this, the circuit J, E, VB and F is again closed, the reed FH being again attracted and the cycle being repeated at the rate of the natural vibration of the reed FH.

The position of the bob or weight W along FH, according to the law of pendulums, will determine the rate of the vibrations and this in turn, as will have been observed, determines the regular alternate energising of the phonic wheel motor coils *a* and *b* and hence the speed of rotation of the phonic wheel and by direct drive the brush axle of the Baudot distributor.

A second and smaller weight is sometimes added to the vibrating reed in order to obtain an adjustment of *small* differences of speed. Obviously the nearer W is positioned towards the end H of the reed, the slower, and towards the fixed end F the faster the speed obtainable.

It is not desirable to fix the reed itself upon a table where it is likely to be subject to vibration from street traffic, heavy machinery in the same or adjacent buildings, &c., &c. It should therefore be fixed to the most solid wall or masonry available. Its extended use in large offices where electrical power is easily obtainable is certain, but in small towns and offices, as is often the case in this country, where power plant is scarce and current not easily available, the supersession of the older-fashioned but well-tried Baudot governor is likely to be considerably retarded.

RE-TRANSMITTERS.

The introduction of automatic Baudot re-transmitters has materially added to the pliability of the system, and has indeed made the possibility of working the system over long distances only limited by the circumference of the globe. The electrical difficulties attendant upon an ordinary re-transmitter such as a repeater dependant upon the loss of time and energy even of the fastest relay are admitted, but given lines of average stability with a system of intermediate Baudot re-transmitters, communication between London and Constantinople by Baudot quad *via* the shorter Channel cable should be a comparatively easy proposition.

The types of Baudot re-transmitters at present in use are two in number.

The simple principle of type one may be quickly grasped by a study of Figs. LXXXV-VII. The *axle* of each selector lever *c*, of a Baudot receiver (see Art. XV, December, 1920), is equipped

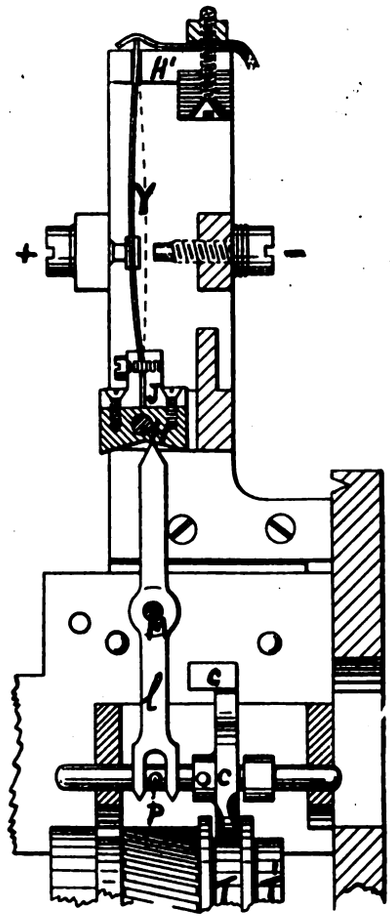

FIG. LXXXV.

with a small projecting pin P. Built above the ordinary receiver is an attachment of 5-forked levers l^1-l^5 (Fig. LXXXVI), one of which is shown in section Fig. LXXXV freely pivoted at its centre. The forked ends of these levers fit over the pin P and their upper ends taper to a finely tempered and polished knife edge. Surmounting this lever is a supporting metal piece H also pivoted at its centre, and to which is fitted an ivory holder J which grips the lower end of a flat steel spring Y. The upper end of this spring fits into a slit in the metal bridge piece H^1. Both sides of the

Digitized by Google

spring Y are fitted with a thin sheet of platinum at the centre, immediately facing two contact screws—which latter are connected to the main spacing and marking batteries.

From our previous studies of the Baudot receiver we can see that when any one of or a combination of the five selector levers, C^1 to C^5, is made by the transmission of the distant station which we will call A, the respective appendix levers will be actuated at the intermediate office B, and eventually each attendant selector or selector lever, Fig. LXXXV will be thrown forward on to T^1, forming the necessary combination and printing the letter signalled as usual. At the same time as C moves forward the pin P will pull the forked end of the lever *l* forward with it. This will throw the knife edge of *l* to the rear side of H tilting the latter upwards and throwing forward the centre of the imprisoned flat spring Y

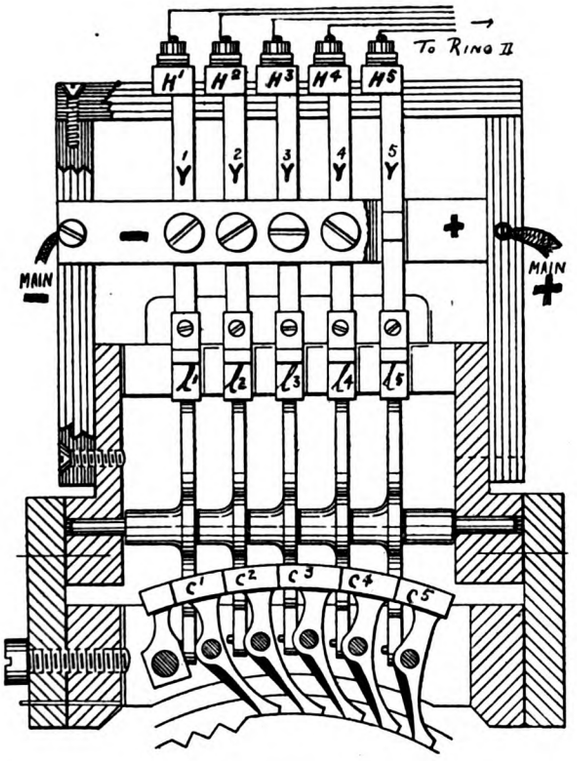

FIG. LXXXVI.

to the marking stop of the re-transmitter. If the ends of the springs Y^1 to Y^5 be connected at their respective bridge-pieces H^1 to H^5, and these to five convenient segments of Ring 2 of another distributor, the re-transmission will be complete, the signals being "stored" in the receivers for practically three-quarters of a revolution of the distributor, when they will be automatically re-transmitted to the distant station, firm full-value signals.

In fact automatic re-transmitters of this type do actually effectively re-place manual transmission so that their insertion at various points in a line whatever may be its length, does not give an *accumulative* effect to line retardation effects. That is to say, the effect of placing two re-transmitters at offices in a line the length of London—Aberdeen, say one each at Leeds and Glasgow, would simply result in the speed of transmission being fixed at that of the normal speed of the slowest section, *i.e.*, there would be no delaying effect due to relay inertia of a mechanical or electrical description as is inevitably the case with even the fastest working *repeater* generally understood by that name.

(To be continued.)

THE TELEPHONE COMPANIES OF GREAT BRITAIN AND IRELAND.

BY ARTHUR E. COTTERELL.

Continued from p. 150.

Owing to complaints as to the restriction of exchange areas the Postmaster-General of the time (Mr. Fawcett) decided to withdraw the restriction in 1884 and fresh licences were issued which permitted the companies to work anywhere within the United Kingdom and to run their own trunk wires. In addition they were permitted to open public call offices and to connect their exchanges with Post Offices for the transmission and reception of telegrams.

Several other companies and persons applied for these new licences, of which a few words will be said presently.

Armed with the 1884 licence the principal companies entered into joint arrangements for the erection of long trunk lines between the principal towns in their respective areas in addition to providing for short trunks themselves within their own borders. Amongst the main joint schemes may be mentioned such circuits as London to Birmingham, thence to Liverpool and Manchester, Birmingham to Derby and Sheffield, thence linking up with the principal Yorkshire towns; Cardiff to Liverpool, and Birmingham to Worcester, Gloucester, Bristol, etc., etc.

Of course London was the name to conjure with, but it was not until July 1890 that the trunk line was completed between the Metropolis and Birmingham, thus opening the service to the latter place and the northern cities beyond.

Most of the other trunk circuits had been completed several years before this event, and the inter-working between the various companies naturally led up to a closer association which ultimately resulted in the "big three": the United, the National and the Lancashire & Cheshire Companies amalgamating in May, 1889, under the title of the National Telephone Company, Limited, which was enlarged for the purpose. Matters did not stop there, as the Northern District Company was absorbed in April, 1890, and the South of England Company in October 1890. These were but stages of a determined policy to bring under the proprietorship of the National Telephone Company, Limited, practically the whole of the telephone business for the British Isles, a policy which was attained by the purchase of the interests of the following remaining companies, viz.:—The Western Counties & South Wales Company in January, 1892; the Sheffield Telephonic Exchange & Electric Light Company in March, 1892; and the Telephone Company of Ireland in January, 1893.

In addition to the above the National Company acquired several small concerns which had private wire businesses or licences from the Post Office for exchange business, viz.:—The Caledonian, the Univeral, the Isle of Man, the Home & the Thanet Telephone Companies, all of which were acquired between 1892 and 1894.

The main value attaching to several of these last-named small companies arose from their possession of Post Office 1884 licences, covering the whole country, which might have got into other hands and lead to some attempts to compete actively with the National Company; moreover, the Postmaster-General had announced in 1892 the Government's intention to acquire the trunk lines of the National Company and to issue no more licences for the whole country, and had made it a condition of his terms with the Company that it should acquire any outstanding licences.

Although the National Company had command of exchanges throughout the country, it was not entirely without opposition, as apart from such exchanges as the Post Office had, there was one outstanding licence in possession of the Mutual Telephone

Digitized by Google

Company, which had established an exchange in Manchester and another in Bolton. This had been rendered possible by the expiry of the Bell patent in December, 1890, and the Edison patent in August, 1891.

The National Company had reduced its tariff charges, on the expiry of the patents, but the Mutual Company, working on a co-operative system with its subscribers, offered much lower rates. As the National Company was naturally not prepared to allow inter-communication between the subscribers on its exchange and those of the Mutual Company, it followed that many firms and persons were compelled to subscribe to both systems.

In 1892 the Mutual Telephone Company's business assets and licence were acquired by the New Telephone Company, after passing through two intermediate sales, viz., first to the Electric & General Investment Company and then the Pioneer Telephone Company. The New Telephone Company, Limited, under the vigorous chairmanship of the Duke of Marlborough, threatened the National Telephone Company with intense competition throughout the country, not only promising lower rates but to provide all subscribers with metallic circuits—an obvious improvement on the single wire circuits in use by the old Company.

The National Company had the enormous advantage of being well established throughout the country, which placed the New Company at many disadvantages. On the other hand, the latter Company could enter the field without a heavy load of watered capital and armed with up-to-date information instead of being faced with all the arduous and costly pioneer work which had been the lot of the old companies. Space does not admit of a lengthy discussion of the obvious reasons which led the two companies to arrive at the conclusion that it would be in their joint interests to work in harmony, a conclusion which first of all led to the National Company subscribing one-third of the capital of the New Company with representation on the directorate and shortly afterwards ended in the National Company acquiring the whole interests of the New Company, which was eventually wound up. In course of time after the expiry of the subscribers' agreements the exchanges opened in Manchester and Bolton by the Mutual Company were closed.

On completion of these transactions the National Telephone Company once more held the field unassailed. True it had been obliged to give up perhaps its strongest weapon in selling the Trunk wires to the Post Office, but it obtained various concessions which were of great help, added to which the Government had decided to grant no more licences for the whole country and only to consider an application for any particular town if supported by the local municipal authority.

In 1898, however, a Select Committee was appointed by the House "to enquire and report, *inter alia*, whether the Telephone Service was calculated to become of such general benefit as to justify its being undertaken by municipal and other local authorities." The Committee reported in favour of competition, both by Municipalities and the Post Office. The Government decided that the Postmaster-General should establish an exchange system in London and grant licences to municipalities when desired. Some 60 local authorities applied for information, but eventually only 13 licences were issued to municipalities. Probably largely as a result of the vigorous campaign engineered by the National Company many of the municipalities were discouraged from proceeding further than obtaining information or procuring licences. In any case only six established exchanges. That five of these were short-lived may be seen from the following table :—

Glasgow	Licensed 1900	Sold to Post Office	1906
Tunbridge Wells ...	,, 1900	,, ,, N. T. Co.	1902
Brighton	,, 1901	,, ,, Post Office	1906
Portsmouth	,, 1901	,, ,, ,, ,,	1912
Swansea	,, 1902	,, ,, N. T. Co.	1907
Hull	,, 1902	Still in existence and has acquired plant formerly belonging to N. T. Co.	

The first Post Office exchange was opened in London on March 1, 1902. Meanwhile, on Nov. 18, 1901, the Postmaster-General and the National Telephone Company had entered into an agreement, with a view to avoiding wasteful competition and unnecessary duplication of plant, which provided also for the purchase on "tramway terms" of the Company's London system on the termination of the licence, which was due to expire on Dec. 31, 1911. Having arrived at such a result the later agreement of Feb. 2, 1905, providing for the purchase of the whole of the Company's system at the end of the licence was only what was to be expected.

Around the movements which have been so briefly recalled, many interesting stories could be told, but space does not admit of them here and now.

MODERN WIRELESS TELEGRAPHY AND TELEPHONY.

BY F. ADDEY, B.Sc., M.I.E.E., FELLOW I.R.E.

Continued from p. 152.

From the explanation given of the action of a oop or frame aerial it will be evident that as the transmitting station is moved sideways away from the plane of the loop, or, what comes to the same thing, as the loop is rotated about the vertical line XY, the signals will get gradually weaker, because the difference in time between the corresponding effects in AB and in CD will get less and less, and so the electro-motive forces in these sides at any instant will be more and more nearly equal and therefore will more and more nearly neutralise one another round the loop. When the loop has been rotated through a right angle, so that its face instead of its edge is directed towards the transmitting station, the effects produced at each instant in AB and CD will be exactly equal, since these sides are now acted on by any particular portion of the incoming waves simultaneously. Hence the electro-motive forces set up in AB and CD will exactly neutralise one another round the loop, no current will flow and the detector will be unaffected.

We have, therefore, in such a rotatable loop a means of ascertaining the direction of the line through the receiving station on which a transmitting station is situated. The loop is turned round, and the directions in which it points when signals are of maximum strength, or in which they disappear, are observed. It should be noticed that with such an arrangement we can only ascertain the *direction* of this line. No indication is given as to the side of the receiving station on which the transmitting station is situated. The determination of this further point, which is known as the "sense" of the bearing of the transmitting station from the receiving station, can, however, by suitable means be accomplished. The method is described below.

In order to avoid having to rotate the actual loop aerial on which the signals are received, a D.F. system has been developed in which the aerial system is fixed, and only a small coil of wire, mounted in the receiving apparatus itself, has to be rotated.

The principle of the arrangement is shown in Fig. 37. Two wire loops A and B, usually of triangular shape for convenience of erection, are set up at right angles to one another. A double coil is connected across the bottom of each loop, as shown in the diagram. These coils form the primary coils of an oscillation transformer, the secondary coil of which is a third coil C, which lies in the space in the middle of the two primary coils. The coil C, which can be rotated about a vertical axis, is joined to the receiver, and takes the place of the rotating aerial previously described.

Digitized by Google

If the transmitting station lies in the line of aerial A only that aerial will be affected by the incoming waves. Consequently, when coil C is turned so that its axis lies along the axis of coil A the effects produced in C, and hence the loudness of the signals will be a maximum, while when coil C is rotated through a right angle no signals will be received. In the same way, when the transmitting station lies in the line of aerial B the maximum strength of signals will be obtained when the axis of coil C points along the axis of coil B. Thus for these two cases the axis of the coil C points towards the transmitting station when the maximum strength of signals is obtained. When the transmitting station is in any intermediate position both aerials will be effected, that pointing more nearly towards the transmitting station being affected more strongly than the other. Currents of proportional strength are set up in coils A and B. As the coil C is rotated it comes under the influence of the currents in both these coils. It can be shown that in this case also, when the maximum strength of signals is received,

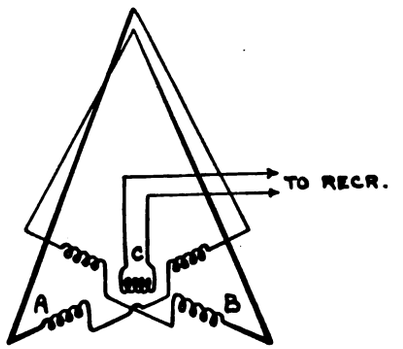

FIG. 37.—DOUBLE LOOP D.F. AERIALS.

the axis of the coil C points towards the transmitting station. Further, for the same intensity of incoming waves, the maximum strength of signals produced is the same in this case as when the transmitting station lies in the direction of either aerial.

"Sense" of Bearing.

The "sense" finding device is a modification of the arrangement just described. The connexions are shown in Fig. 38.

The centre points of the coils A and B are joined together, and are connected through the coil P and the high resistance R to earth. The coil C is joined in series with a coil S (which is the secondary coil of an oscillation transformer of which P_1 is the primary), the condenser K, and the primary coil P_2 of another oscillation transformer. The secondary coil S_2 of this oscillation transformer is joined to the receiver. The circuit $C P_2 K S_1$ is tuned to the frequency of the incoming waves.

The action of the loop aerials on coil C is exactly the same in this case as with the arrangement shown in Fig. 37. The whole aerial system, however, now acts in addition as an ordinary open aerial, and when signals are received high-frequency currents are set up in the path P_1 R between the aerials and earth. Thus the circuit $C P_2 K S_1$ is acted on simultaneously by the electro-motive forces set up in the coil C from the coils A and B and those set up in the coil S_1 from the coil P_1. With this arrangement properly adjusted it can be shown that when the coil C is set so that its axis is pointing towards the distant transmitting station, the signals heard on the receiver will be a maximum when the transmitting station is on one side of the receiving station, while no signals will be received when the transmitting station is on the same line but on the other side of the receiving station.

Thus the "sense" as well as the direction of a transmitting station can be obtained.

Position Finding.

When the bearings of a transmitting station from two or more receiving stations, the positions of which are known, have been obtained, the position of the transmitting station can be plotted on a chart. Lines are drawn through the positions of the receiving stations in the observed directions and the position of the transmitting station is evidently the point where these lines cross.

Present-day Applications of Wireless.

We have now dealt with the purely scientific aspect of the various sections of the subject mentioned in the introduction to these articles. It will, however, no doubt be of interest to indicate briefly how these various developments are being applied to practical use.

Stations for communicating with ships at sea are now provided by practically all maritime countries.

In this country we have such stations at Cullercoats, Grimsby, North Foreland, Niton, Lands End, Fishguard, Seaforth and Port Patrick, while in Ireland there are stations at Malin Head and Valencia. These stations are all fitted with spark apparatus. The average range is about 300 miles. In addition there is a station at Devizes, fitted with a valve C.W. transmitter, for working to ships provided with C.W. apparatus. This station can communicate with ships over distances up to 2,000 miles.

Many powerful stations for long-distance communication have been erected in this and other countries. Here, the Marconi Company have erected stations at Carnarvon and Clifden for the American service and at Chelmsford for communication with Paris. The Post Office has the arc station at Stonehaven, which works to Berlin, Posen and Budapest, the valve station at Caister for communicating with Amsterdam, and finally, the large arc station at Leafield, with its associated receiving station at Banbury, for communicating with Abu Zabal, near Cairo—the first link of the Imperial Wireless Chain. An arc station has also been opened at Northolt, near London, for medium distance continental communications.

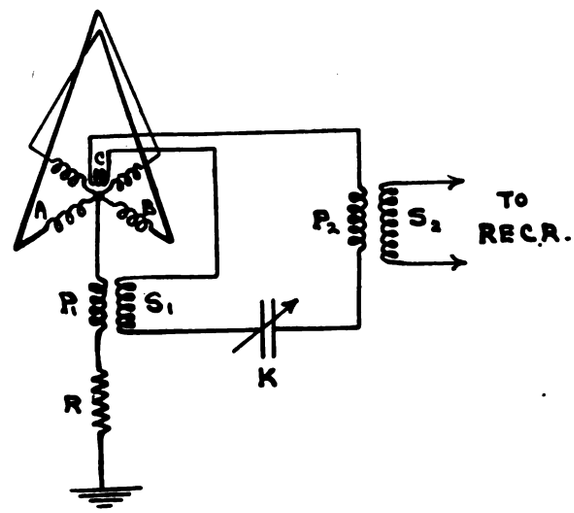

FIG. 38.—ARRANGEMENT FOR DETERMINING "SENSE" OF A BEARING.

Direction-finding stations are in course of erection at various points round the coast to facilitate marine navigation, and before long it is to be hoped that a ship will be able to find her way when approaching land in foggy weather as easily as she can do at present when all the lighthouses are visible. For aircraft a series of wireless telephone stations has been erected on the line between London and Paris. The occupants of an aircraft can thus communicate with the ground, and, by means of the switching system described above, can be put through to the ordinary telephone system. By D.F. apparatus at the ground stations the pilots are kept informed of their position, and they can thus find their way even when the ground is hidden by fog.

Between Los Angelos, in California, and the town of Avalon, on Santa Catalina Island, a telephone circuit is provided which consists of an ordinary trunk line on the land at each end with the connexion across the San Pedro Channel carried out by wireless.

Digitized by Google

The two-wave non-switching system is used, and subscribers at either end can communicate with one another exactly as if they were speaking over an ordinary line. Signalling between the two terminal exchanges is also carried out over the wireless link.

Conclusion.

In conclusion, it should be mentioned once more that the foregoing articles have been written for the general reader who has only a slight acquaintance with the fundamental principles of electricity and magnetism. It has, therefore, been necessary to deal with the subject in a very elementary manner.

It is hoped, however, that the treatment, so far as it goes, has been such that any reader who wishes to learn more of the subject will be able to continue his studies not only feeling that he has nothing to unlearn, but rather that he has a sure foundation on which to build his subsequent work.

REVIEWS.

"Wireless for the Home."—By Norman P. Hinton, B.Sc. Sir Isaac Pitman & Sons, Ltd., Parker Street, Kingsway, W.C.2., and Radio Press, Ltd., 34/35, Norfolk Street, Strand, W.C.2. 2s. nett.

"Written by an expert for the amateur." is what the publishers say, and it is an excellent description of the book. Couched in simple language, shorn of the robe of mystery, and rich with illuminating similes, this book is just what it purports to be—a guide to the main principles for all who contemplate installing wireless apparatus. Mr. Hinton does not purport to teach a person without any knowledge of wireless how to build an effective receiving set out of a cigar box, a packet of hair-pins, and a little bell-wire; but he does offer capable advice as regards the right type of apparatus and why.

We notice that the old dimensions of the standard aerial have been retained, probably owing to delay in the press; and we doubt whether the use of a small generator for preliminary tuning on continuous wave will be permitted in connexion with broadcast reception sets.

Elementary Determinants for Electrical Engineers. By H. P. Few. S. Rentell & Co., Ltd., 36, Maiden Lane, W.C.2.

This work, which is a reprint and revision of articles in *Electricity*, deals fully with the methods of evaluating determinants and the application of determinants to problems in electrical testing, telegraphy, telephony, power distribution, balancing of cables, &c. Good exercises are appended to each chapter so that students may readily test their progress. The work is well compiled, and should prove useful to electrical engineers and students of electrical physics.

GOLF. MANCHESTER.

On June 12 a golf match was played between the Head Post Office and the Newton Street Office, at Manchester. The match was played on the Mnnicipal Links in Heaton Park, and resulted as follows:—

Head Office.		*Newton Street.*	
Mr. G. R. W. Jewell ...	0	Mr. J. G. Maddan	1
„ F. H. Gibson	1	„ W. Brookes	0
„ J. Waterhouse	1	„ Alan Cameron	0
„ P. H. Greenhouse ...	1	„ R. H. Fitton	0
„ R. Campbell	1	„ R. Crewdson	0
„ F. Evenson	0	„ C. Sillitoe	1
„ A. O. Bourdeaux ...	½	„ C. H. Carter	½
„ T. W. Capenhurst ...	1	„ J. Farran	0
„ Arch. Cameron	1	„ G. M. Alexander ...	0
„ J. M. Lucas	1	„ F. Cockerlin	0
„ G. P. McDonnell ...	0	„ C. A. Morgan	1
„ J. McDonough	0	„ J. McCourbie	1
„ C. MacFarlane	1	„ J. Eastwood	0
„ G. F. Staite	1	„ J. W. Little	0

Totals: Head Office 9½ games; Newton Street, 4½ games.
Head Office won by 5 games.

The Club holds the usual competitions during the summer season, and a winter medal competition for players with handicaps of 18 or more.

FROM TELEGRAPHIST TO POSTMASTER-GENERAL.

To start from the bottom of the official ladder and rise to the top is a career few telegraphists can hope for, but such has been the career of Major E. A. Sturman, C.B.E., now Postmaster-General of the Union of South Africa.

He joined the C.T.O. in 1879, but finished his London service in the Metropolitan Engineering Branch, being transferred in '89 to the Cape Colony C.T.O. He was not destined to serve there many years, as his all-round abilities and capacity for organising soon gained him promotion to the Administration Branch of which he became Chief Clerk in 1910. After the Union of the South African Colonies, he was made Assistant Under-Secretary in 1912; Under-Secretary in 1919 and now Postmaster-General. Holds South African War Medal 1899-1901. Was Officer Commanding Army Post Office, and Chief Field Censor in German West Campaign. Mentioned in Despatches, and made Officer and subsequently Commander of the Most Excellent Order of the British Empire, 1918. Also organised the S. A. Gifts and Comforts Committees.

The athletically inclined among the older members of the C.T.O. will no doubt remember him as a prominent runner, both on the flat and across-country, whilst for some years after his departure the name was recalled by means of the annual competition for the "Sturman" Cup, a challenge cup presented to the old Electric Athletic Club by his father, Dr. Sturman.

The appointment is a very popular one as can be gathered from the fact that the Cape P.T.C.A. entertained Major Sturman to dinner in honour of his promotion.

ELECTRIC VALENTINE.

A CORRESPONDENT sends us the following cutting from an old number of *Nature*. Some of the allusions will give a vague indication of the date when it first appeared:—

TELEGRAPH CLERK (*a*) to TELEGRAPH CLERK (*b*).

The tendrils of my soul are twined
With thine though many a mile apart;
And thine in close-coiled circuits wind
Around the magnets of my heart.

Constant as Daniell, strong as Grove;
Seething through all its depths like Smee;
My heart pours forth its tide of love
And all its circuits close in thee.

Oh, tell me, when along the line
From my full heart the message flows,
What currents are induced in thine?
One click from thee will end my woes!

Through many an ohm the Weber flew,
And clicked his answer back to me
I am thy Farad, staunch and true,
Charged to a volt with love for thee.

MUSHROOMS IN TOWN.

A LITTLE group of workmen stood outside the Museum Telephone Exchange, near to Goodge Street Station. Under a grating a bunch of healthy fungi was discovered. A scientific professor, from University College close by, after careful examination, pronounced them to be mushrooms, both "edible and nutritious."—*Daily Graphic.*

The Telegraph and Telephone Journal.

PUBLISHED MONTHLY IN THE INTERESTS OF THE TELEGRAPH AND TELEPHONE SERVICE, UNDER THE PATRONAGE OF THE POSTMASTER-GENERAL.

Editing and Organising Committee - - - J. STUART JONES. JOHN LEE. J. J. TYRRELL. W. A. VALENTINE. J. W. WISSENDEN.

Managing Editor - - W. H. GUNSTON.

NOTICES.

As the object of the JOURNAL is the interchange of information on all subjects affecting the Telegraph and Telephone Service, the Managing Editor will be glad to consider contributions, and all communications together with photographs, diagrams, or other illustrations, should be addressed to him at G.P.O. North, London, E.C.1. The Managing Editor will not be responsible for any manuscripts which he finds himself unable to use, but he will take the utmost care to return such manuscripts as promptly as possible. Photographs illustrating accepted articles will be returned if desired.

VOL. VIII. AUGUST, 1922. No. 89.

TEAM WORK.

IT is with feelings of keen interest, great hope and much encouragement that I take up the position of Director of the Telephone and Telegraph Services. During the past 40 years I have seen various Telephone Administrations struggling against adverse circumstances which tended to retard development and efficiency, the culminating adversity being the Great War and its aftermath. We have, however, strong reason to hope that the path of development in the future will be smooth and straight. I am encouraged to think that full advantage will be taken of the improved conditions of to-day by the knowledge that I shall have the whole-hearted assistance of a body of workers of all grades throughout the country, whose ability and devotion to duty are sure guarantees that no effort will be wanting to provide the efficient Telephone Service which is so vital a necessity in the domestic, social and commercial life of the community. It is our responsibility to bring the Telephone and Telegraph Services to the highest possible standard of usefulness and efficiency, and no member of the staff can but help feeling the stimulus of being part of a great and progressive organisation in partnership with the nation.

Within recent years we have passed through a strenuous and difficult time. The stoppage of progress led to the accumulation of very considerable arrears of necessary works. These arrears have now been largely overtaken, and the time is propitious for a great development which will add to the amenities and resources of our people. If the Telephone Service is to be adequate to the needs of the community, it should not only be widely extended in the towns, but also in the country and the scattered farms. To justify itself, it must be a satisfactory servant of the people, and every subscriber and member of the public should come to feel that the Post Office is ready and anxious to meet their requirements and to help in overcoming their difficulties. The public, on its own part, requires to be educated in telephone knowledge, and there can be no more successful form of telephone propaganda than for every individual man and woman in the Service to assist in spreading that knowledge. Much the same applies to the Telegraph Service in rather different circumstances, and though public attention has been directed mainly to the Telephone Service, I have no intention of overlooking the possibility of the further adaptation of Telegraphs to the public needs.

By strengthening the links of the chain which bind the various sections of the Services, and by working as one team with a single object, we shall in due time achieve our purpose. I am confident that, in this joint effort, the JOURNAL will take as it has done in the past, a most important part.

R. A. DALZELL.

A PROBLEMATICAL "LUXURY."

WE usually hesitate to touch upon politics, and, above all, on international politics, in the JOURNAL, but where the politics concern telephone development we think the reproof *ne sutor ultra crepidam* can hardly be applied to us if we make a comment. According to the Press, the Inter-Allied Commission has had to make strong representations to the German Government regarding their scheme for placing the trunk lines underground. The Germans pleaded that the outlay was necessary for the efficiency of the Service, and the Commission is alleged to have replied to the effect that it was for a luxury which France and Britain did not permit themselves to afford. Great Britain, however, as our readers are aware, is well advanced with an extensive scheme of subterranean cables for her long-distance lines.

We need hardly say that we hold no brief for the German Government, but we do hold a brief for the development of the telephone in Europe. So long as the view that the telephone is a luxury is cherished by Governments so long will America outdistance the Old World in the development of the telephone. What Europe needs for her economic and commercial welfare is the highest efficiency and the fullest expansion not only of her internal lines but also of her international lines. When this is realised, Ministers of Posts will no longer need to offer to their legislatures apologetics for the poor figure their countries cut in comparison with the United States.

HIC ET UBIQUE.

WE offer our hearty congratulations to Mr. R. A. DALZELL, C.B.E., on his appointment to the newly-created post of Director of Telegraphs and Telephones. Mr. Dalzell was born at Poona, India, 1865, and educated at Edinburgh and Dulwich College. His telephonic career began in 1881 in the service of the Globe Telephone Co., and we publish elsewhere some details of his career.

THE Anglo-Dutch telephone cable was laid between Aldeburgh and Domburg (Walcheren) on July 8, after considerable delay own to bad weather. The adjustment of the land lines is proceeding, and a service, at least to the Hague, will probably soon be available.

WE learn from the Press that the Anglo-Portuguese Telephone Co. has had authority to raise its rates 75 per cent. on business connexions and 50 per cent. on residence connexions.

ACCORDING to the *Automatic Telephone*, Russia is spending a million dollars on automatic telephone plant. The payment we are told will be made in gold.

THE Postmaster-General has sent the following commendatory letter to the retiring Engineer-in-Chief :—

June 1.

DEAR SIR WILLIAM NOBLE,

I cannot let you leave the Post Office without telling you in writing what I have already told you in conversation—how great is my admiration for your record in the service of the Department.

Commencing as a telegraph boy 48 years ago, you reached in 1919 the position of Engineer-in-Chief, and you have had under your control in that capacity plant of the value of £100,000,000, an annual expenditure of £15,000,000, and a staff of 25,000. You have also been the chief advisor to the Department on the placing of contracts involving the expenditure of many millions of public money. These great responsibilities you have discharged with conspicuous efficiency and with a single eye to the public interest.

During your career you have served under seventeen different Postmasters-General, and I am sure all of them who are still living would join with me in saying that your record in the Post Office is an outstanding example of what can be accomplished in the face of great difficulties by grit, capacity, hard work, and long-sightedness. I am sure the record of your career will be an inspiration to every boy who joins this great Department.

The salary which the country considers adequate for technical services such as yours appears parsimonious when compared with the rewards obtainable in private enterprises; but although as a Scotsman you have borne this with patience, I hope you have some compensation in the knowledge that your name is held in respect in every postal administration in the world.

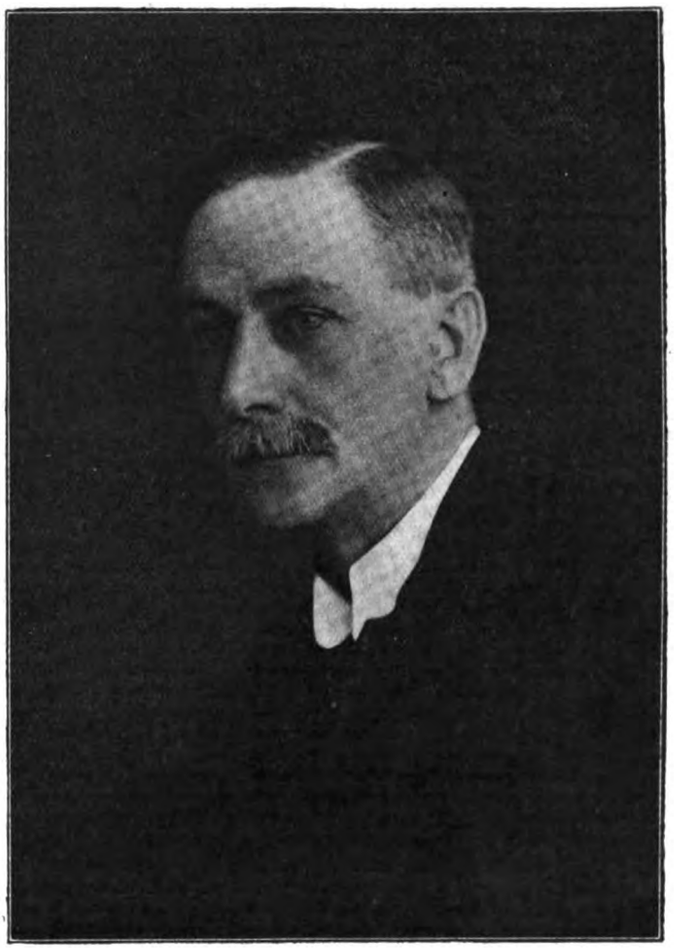
You leave the British Post Office with the admiration and affection of all your colleagues.

I am, dear Sir William Noble, yours faithfully,

Sir William Noble. F. KELLAWAY.

MISS ANNE BARNES, Travelling Chief Operator to the Iowa Telephone Association, frequently enlivens the pages of *Telephony* with short moral tales addressed to telephonists. She tells the story of two little girls who entered the village school on the same day. Alice Marie gave perpetual trouble to the sweet-voiced teacher. "She left school at an early age and was married to a worthless cigarette holder. To-day she is a small town divorcee." Marceena was always a good little girl. You will perhaps guess that she married a worthy cigar-holder and is now a large town divorcee. You are wrong. "To-day she is chief operator in a city and has 100 operators under her supervision. Moral: When considering an applicant for telephone work enquire into the applicant's school life record. You will be safe in making your decision then."

CONSTANTINOPLE TELEPHONE SERVICE.



Mr. F. Douglas Watson, so well known to many of our readers, sends us the following interesting information from Constantinople.

The telephone system in Constantinople, notwithstanding the utter stagnation of business generally in the city, continues to make satisfactory progress. During 1921 the stations increased from 6,822 to 7,697—or nearly 13 per cent. During the same period the calling rate per subscriber per day rose from 4.7 to 5.5. The system being entirely on the message rate basis, the last-named increase is specially important.

The population of Constantinople have acquired the telephone habit, and the service given is good, with an average delay in answer by the operator of 6.7 seconds.

With anything like a return to normal business conditions, the management anticipate a quick development. But until Anatolia and Southern Russia are opened again for trade, it is feared there will not be much improvement in the business of the city.

There are the usual difficulties experienced by British staff in conducting a telephone service in any foreign country—only more so! All operators must speak correctly at least two languages, Turkish and French. Many speak more. Some can speak seven or eight, including English. The operating staff is entirely native, Greek, Armenian and Jewish—with a very few "hanoums" (Turkish girls). The last named class are the most difficult to train, thanks largely to the past generations of isolation of the hanoum in the harem. But all the native races are intelligent and capable of being taught.

MR. R. A. DALZELL

(*Director of Telegraphs and Telephones.*)

SOME AUTOBIOGRAPHICAL REMARKS.

WHEN I entered the service of the Globe Telephone Company in the early eighties, we were not a great deal advanced from the time when only musical sounds could be transmitted by means of the telephone. Indeed, it was only some five years earlier, in 1876, that Sir William Thomson (Lord Kelvin) had introduced Bell's speaking telephone to the British Association meeting in Glasgow, and it was then regarded by some people as little more than a scientific toy. The *magnum opus* of the Globe Company, if I may so describe it, was the erection of a telephone exchange at the Wool Exchange. All the lines were single circuits. The Post Office started the first metallic circuit system at Newcastle, and when eventually I went to Newcastle to assist the Northern Telephone Company, we adopted a similar system. The difference between the two systems was that the single circuit caused a lot of cross talk from circuit to circuit and the lines were not "silent." With the metallic circuit two lines were used instead of one; this obviated disturbances from circuit to circuit and prevented interference through extraneous electrical causes.

When the Globe Company became defunct as the result of litigation with the United Telephone Company over questions affecting patents, I transferred to the latter Company for the purpose of supervising the Globe Company's apparatus which was then in operation. Neither of those early companies was overburdened with subscribers; the United had about 3,000 subscribers and the Globe a few hundreds. On moving to Sunderland as electrician to the Northern District Telephone Company, I found that they had no subscribers in Newcastle. However, we soon established an exchange larger than that of the Post Office, which had just previously set up its first large exchange in the country at Newcastle, and we got together a fairly extensive clientele.

It is interesting to recall that in the old days two operators were required to handle a subscriber's call. Under the original system, the subscriber pressed a button on his telephone. This caused a shutter to fall in front

Digitized by Google

of the operator at the switchboard. She manipulated a flat plug, which she inserted in the switchboard, and thus connected the caller with another operator sitting immediately behind her. The second operator asked: "Number, please," and then passed it to the first operator, who proceeded to establish the connexion. The whole process was comprised in one operator speaking with the subscriber and the other operator moving the plugs as required.

After successive periods of service as Manager of the Blackburn and Leeds Districts of the National Telephone Company, and District Manager of the Western District of London, I became Assistant Superintendent for London, an appointment which carried with it supervision of both the engineering and administrative sides of the business. I then moved on to Bristol, where I was Superintendent of the West of England Province, and I was stationed there in 1912, at the time of the transfer of the telephones to the Post Office. Shortly afterwards I returned to London, and in 1916 was appointed Inspector of Telegraph and Telephone Traffic; in 1919 I became Chief Inspector.

At the time of my connexion with the Northern Company, the country was practically without trunk communication; but we established trunk working between Leeds and the North *via* Northallerton with Hull, Grimsby, York, and other towns in the neighbourhood.

Prior to the opening of the Bristol Exchange, telephones were worked on the magneto system. Bristol was the first Central Battery exchange in the country. Kensington Exchange, in London, was the next. Subscribers on those exchanges were relieved of the necessity of turning a handle to cause a bell to ring or a shutter to fall, in order to secure the attention of the operator. Instead, most of the electrical apparatus was concentrated at the exchange, and the mere act of lifting the receiver at the subscriber's end caused a lamp to glow at the operator's desk in the exchange. This is the principle followed at the present day at practically every exchange throughout the country. I have therefore seen the development of the so-called "scientific toy" from the original single circuit wire, with Blake or Hunnings' transmitters and without multiple switchboards, through the period of metallic circuits, multiple switchboards, and magneto operation, to the Central Battery system which, in its turn, is giving place to the automatic system. Automatic telephony is being rapidly developed, and I think that the future of telephony lies largely in that direction, although I would make the reservation that there will always remain exceptional cases where manual operation will be necessary, either as regards more economical working or more efficient service, or both. I hope to see the automatic telephoning of London commenced in my time, but it will be many years before such a scheme can be completed. Apart from technical considerations it requires deep economical study.

As regards telephone development, I shall try to give effect to the P.M.G.'s stated policy, and I want the public, who are, after all, the most important part of the organisation, to be in the full confidence of the Post Office and to understand thoroughly what is being done in the way of research and development. It is only with the subscribers' assistance and co-operation that real efficiency can be secured, and it is then our duty to ensure rapid and efficient development.

TELEPHONE DEVELOPMENT STUDIES.

BY H. JULIUS MACLURE.

WERE it possible to forecast definitely the actual number of lines which would be working on any given exchange on a particular future date, telephone men would be saved much trouble, although they would be deprived of a large amount of work which is fascinating to those whose duties bring them into contact with development studies.

As it is, present circumstances require that estimates must be compiled of at least the number of direct lines, external exchange extensions, private wires and trunk and junction circuits, which should be provided for in particular areas during a certain space of time, usually the ensuing 20 years divided into 5-yearly periods. When automatic exchange equipment is in contemplation, the estimate requires to be amplified by so distributing the figures under the general heading of "direct lines" that development may be provided for under each of the following sub-headings: namely,

Direct single exchange circuits (excluding all coin box circuits).
Auxiliary and P.B.X. circuits.
Subscribers' coin box circuits.
Coin box call office circuits.
2-party circuits.
Rural party circuits.

Obviously if success is to be obtained, the figures to be furnished in the case of the larger Exchanges must be based upon a "block" survey, in connexion with which past, present, and future conditions must have received full consideration, and been allowed for. When very small exchanges are concerned, an actual block survey may not be imperative, but nevertheless when preparing these estimates it is equally necessary to take all points into consideration.

The accuracy of development forecasts depends to a large extent upon the temperament of those who compile them, and one who is lacking in enthusiasm as regards telephone service, in imagination, and in a love of detail will, of a certainty, fail to evolve reliable data. Perhaps capacity for imagination is of the most importance, but it must be practical imagination, and not that of an Alnaschar order.

What man is there of those who helped to develop, and who used the service in the early eighties, who even dreamed in those now far-off days of the hundreds of thousands of telephones now in London alone? Yet we are still many years behind our American cousins, and with their example before us, we should appreciate that the telephone service is only in its early stages with us, and that the education of the public on telephone matters is most elementary.

The present-day British telephone man must refuse to understand the meaning of the word "saturation." There is time enough for consideration of the import of the word to be left to his grandchildren.

The constant mistake in British telephone circles has been in providing insufficient plant to meet the needs of actual development. Who can recollect a case of over-provision? Who fails to remember the innumerable instances where, but for shortages of plant, hosts of telephone users would have become subscribers months, or even years, earlier than was the case?

If, therefore, adequate plant conditions are to come about, those responsible for development forecasts must bestir themselves, and evolve such reliable figures of future growth as will warrant the provision of plant equal to all requirements. More thousands of pounds of revenue have been lost, month by month, in the past, by the non-provision of plant really required, than there is any remote likelihood, with our innate conservatism, of being lost, in the next twenty years, in interest on the value of plant provided with too lavish a hand.

The duty of examining and criticising very many sets of development forecasts, covering all parts of the country, leaves the impression that in many instances the past, rather than the future, has received the greater amount of consideration. This suggests a lamentable lack of imagination. True it is that what has taken place in the past should be set out clearly, and have every consideration, but the main factor to concentrate upon is the future.

When setting out to compile a development estimate, it is reasonable to assume that plant to meet all requirements will be available in the future, that reasonable rates will be able to be quoted, that a good service will be given, that continuous canvassing under business conditions will take place, and that telephone service will become as much a matter of course with the public as present-day sanitation, fixed baths, electric light, trains, motor travel, and a dozen other now every-day aids to health, and at any rate relative happiness, which were never even dreamed of, and when awakened to, laughed at at first, by our fathers and grandfathers.

When, therefore, it comes to the point of tabulating figures for the future, the past has of course been examined as also the future, the latter be it assumed, with practical but optimistic imagination. Houses have been visualised where now there are open spaces, large houses in particular localities regarded as converted into flats, at present decayed private residences thought of as transformed into good offices, a florishing City, or even a Tube station looked for in place of what is now a very mean back street site or building, and, in country districts, a pushing little Town sometimes seen where at present there is little more than a sleepy Village, this because a once-quiet lane will often in a few years become a busy motor-route.

Starting, therefore, with the gross direct exchange line figures set out in, say, four 5-yearly periods, thus covering 20 years, these should first be examined by the aid of geometrical increase tables to see what results. Perhaps there has been set down—

	Years.	Direct Lines.
(*a*)	1922	1,000
(*b*)	1927	1,403
(*c*)	1932	1,923
(*d*)	1937	2,397
(*e*)	1942	2,917

Applying the tables named, the results will be:—

(*b*)	7 per cent.
(*c*)	6.5 „
(*d*)	4.5 „
(*e*)	4 „

and at the first glance the rate of progress appears reasonable. But the progress should also be examined from a strictly arithmetical point of view. This will give:—

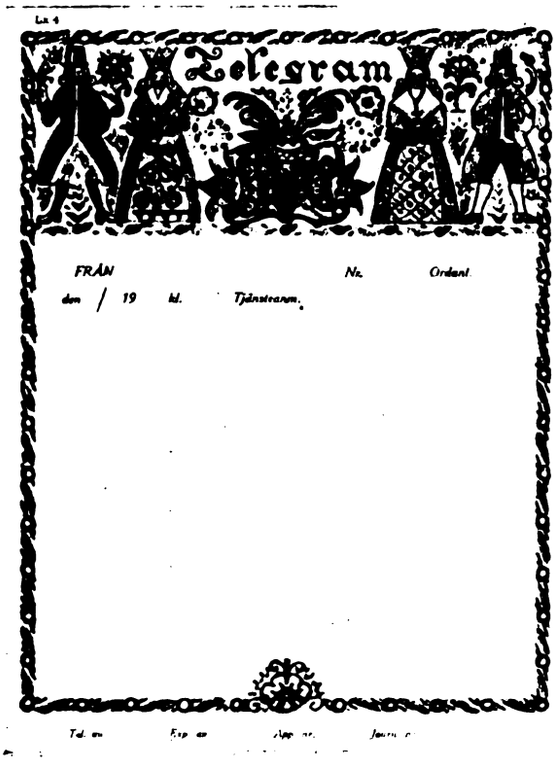
			An average annual growth of
1922	1,000	}	= 403 or 80+3
1927	1,403	}	
1927	1,403	}	= 520 or 104
1932	1,923	}	
1932	1,923	}	= 474 or 94+4
1937	2,397	}	
1937	2,397	}	= 520 or 104
1942	2,917	}	

Why the drop in the annual rate of growth at the 1932-37 period? Unless there is some actual reason for this inequality, it is obvious that some adjustments in the figures are necessary.

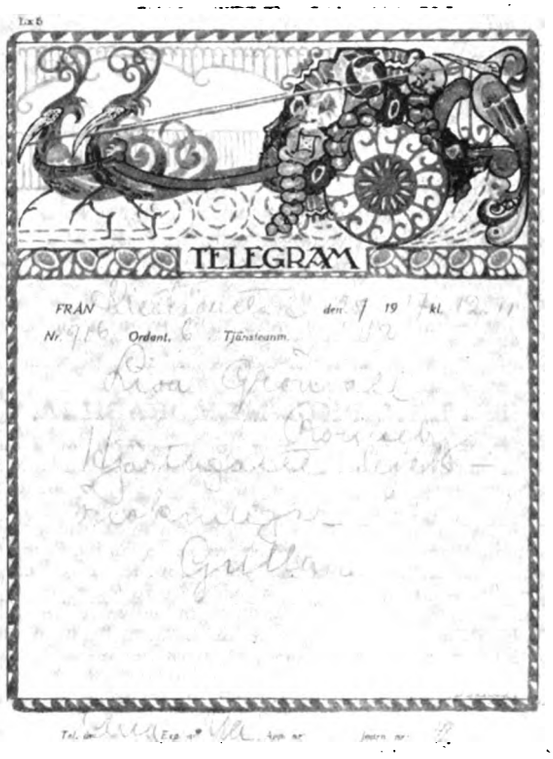
Digitized by Google

This brings us to the subject of the value of the geometrical increase percentage tables. They provide the means of applying a very useful check to see that any estimated increases are within reasonable limits, and they mark clearly any more or less heavy variations. For example, they might when applied to certain figures show a percentage increase of 30 per cent. for a first period, 10 per cent. for a second, 15 per cent. for a third, and 3 per cent. for a fourth. Thus, unless wholly abnormal development conditions happened to apply in that particular instance, the figures quoted would be direct evidence of something being wrong.

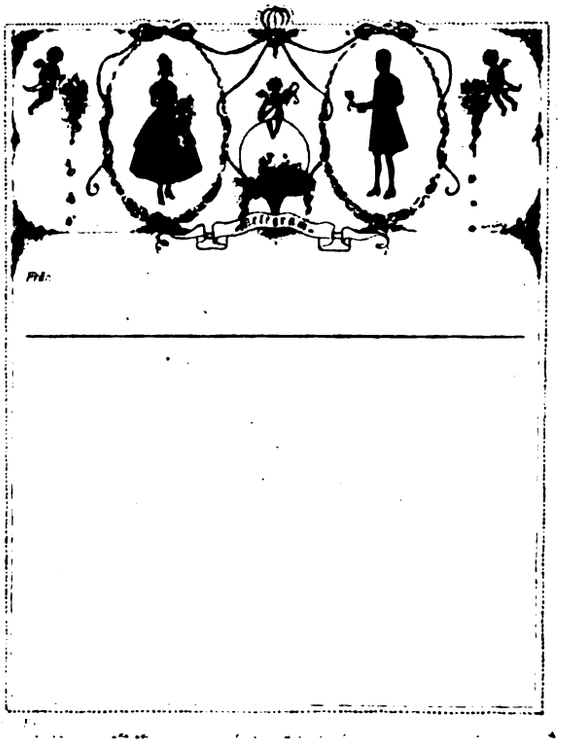
The tables also afford the most simple means of extending an approved figure for a required period, or periods of short duration, but they should certainly not be used as the sole means of arriving at estimated figures of development in conjunction merely with details of past growth.



But perhaps the most difficult figures to arrive at are those distributing gross totals between Direct Single Exchange circuits, Auxiliary and P.B.X. circuits, Coin Box circuits (Subscriber and Call Office), and Party Line circuits (Two-party and Rural party). The mere application all round of percentages would give misleading results. Perhaps in the case of Auxiliary and Private Branch Exchange circuits, all other matters being equal, percentage calculations based on the existing proportion will carry the matter a long way, but as regards Coin Box and Party Line circuits, the only safe way is to estimate each class, and for each period, strictly on the merits of the local conditions as they can best be visualised during each period. In the matter of Private wires, and External Exchange Extensions, here again the estimates can only be based on the same factors as have been taken into consideration in the case of ordinary direct Exchange lines, but local conditions have frequently a greater bearing on these classes of circuit than they have, as a rule, on ordinary direct exchange line circuits.



The question of Trunk and Junction line development figures is one outside this short article, and is left to be dealt with by another pen.



ILLUMINATED TELEGRAPH FORMS IN SWEDEN.

BY ALEC B. EASON, M.A.

THE use of congratulatory telegrams is widespread in Sweden because festivals in the home, such as birthdays, anniversaries of weddings, and "name-days" are celebrated to a far greater extent than in England. "Name-days" refer to the fact that each day of the year has been allotted a person's Christian name, and when the day arrives which bears your Christian name you may be the fortunate recipient of a present: someone will certainly do something to let you know that it is your "name-day." One way in which people celebrate festivals is by dressing up to represent historical or theatrical personages. Swedish artists, Carl Larsson especially, delight in showing such festivals in their pictures, and it is evident that the Swedes are not such matter-of-fact people as ourselves. Friends send congratulatory messages on the occasion of any festivity and usually employ one of the "luxury" forms as shown in the figure herewith. When the sender hands in his telegram he states which form is to be used, and the delivery office writes or types the message on the relative form. The sender pays the ordinary fee for the number of words in the telegram,

Digitized by Google

and in addition pays 10½*d.*, of which 4½*d.* is for the form and 6*d.* goes to the National Society for Prevention of Tuberculosis. The forms are punched on the left hand side so that they can be bound and kept as a memento of the occasion; it is usual for a number of the messages to be in rhyme and to be humorous. The following four instances of the number of telegrams received may give an idea of how much the forms are used. The people concerned were ordinary middle-class folk.

At the weddings of the daughters of two doctors in the same town—a place similar in size to Guildford in England—154 luxury and 23 plain forms were received in one case, and 27 luxury and 47 plain forms in the other. One of these doctors received 90 luxury and 20 plain forms on his 70th birthday, and a banker in Malmö on the occasion of his retirement from the bank at the age of 60, received 140 luxury and 70 plain telegrams.

By means of these artistic telegraph forms the Scandinavians combine a little business with philanthropy and pleasure.

TELEGRAPHIC MEMORABILIA.

THE C.T.O. is gradually becoming quite a centre for wireless traffic. Gradually and quietly, without fuss or advertisement, it is advancing with modern developments. Long before the Press had boomed the art of "broadcasting" it had transmitted two or three times daily an interesting *resume* of the day's news, and for what is now a matter of years had dealt with a considerable amount of ships' telegrams. It is true that these latter were not sent off from the aerial that surmounts the Post Office buildings but they were transmitted direct by special wire to the nearest jumping-off point. From this stage there is apparently gradually evolving an improving system by which the depression of a key in London, by means of wires led direct into the wireless station proper, controls the distant wireless transmission on to the aerial, the intermediate re-transmission at the wireless station thus being transmitted automatically and without actual re-handling of the telegrams.

Certain services are still dealt with by indirect re-transmission, that is to say, the wireless station takes off the telegrams from London and re-transmits them by hand on to the aeria'. Of these may be cited the communications between Great Britain and Poland, Roumania, Italy and Egypt, and certain ship services. Of the wireless communications which are controlled directly by London and worked by Wheatstone or hand transmission at the respective average speeds of words per minute as indicated by the bracketed figures it is interesting to note, are the wireless circuits of London and Berlin (23), Cologne (100), Amsterdam (25), and Halifax, Nova Scotia (30). The respective English re-transmitting or controlled points of the Anglo-German and Anglo-Dutch communications are Stonehaven, Aldershot and Caister, that of the Anglo-Canadian is Banbury-Leafield for outward transmission. The Berlin circuit is controlled on the German side by means of a land-wire between Berlin and Königswusterhausen and the Cologne circuit by a land-wire between Cologne and Riehl. The Berlin circuit is worked duplex, the outward signals being sent out from the C.T.O., London, by means of a TS—Stonehaven wire on to the Stonehaven aerial while the inward signals are received on an aerial positioned on the C.T.O. roof and passed down by means of a relay into the Cable Room where on occasions they are received by Creed printer. The Cologne circuit, which for certain technical reasons is by far the better of the two Anglo-German circuits, is a simplex one, traffic being dealt with in half-hourly "runs" by means of Gell-perforated Wheatstone slip at a speed of 100 words per minute. Higher speeds have been attained. When the ether is fairly free from "atmospherics" remarkably well-defined signals are obtainable which may be printed off with perfect ease by means of a Creed printer, and on these occasions it is of course quite unnecessary to run the slip more than once. The London-*cum*-Banbury-*cum*-Leafield combination is as is well-known primarily for use in the Imperial Chain, and when good conditions obtain throughout may be easily read as far away as Perth, Western Australia. As a daily practical and reliable service this latter is not however a working proposition and was never designed so to be. It is cited simply as a token of possibilities. The Anglo-Egyptian communication though still at its infantile stage is an accomplished fact through the medium of London, Banbury and Lefield on English and Cairo and Abu Zabel on Egyptian territory. Excellent work has also been accomplished on the Anglo-Canadian circuit for weeks in succession working off the aerial at Leafield controlled from London through the medium of the London-Banbury-Leafield wire. The co-operation on the Canadian side in the case of the latter communication has left simply nothing to be desired. From four to five thousand words of press have been dealt with nightly, sometimes with but a couple of R.Q.s.

A contributor, who by the way points out that the *Court Circular* in recording the visit of the Duke of York to the C.T.O. in May last described the building as situated in Aldersgate Street instead of in St. Martin's-Le-Grand, reminds our readers of the historic interest attaching to the site upon which the huge London telegraph office stands and excerpting from Stow relates how: "The old college of St. Martin's-le-Grand claimed great privileges of sanctuary, &c., the abuse of which led to the place becoming a mere refuge of rogues, ruffians, thieves and murderers. Any rascal who stabbed his pot-companion, or struck down an innocent traveller in a dark bye-street, any red-handed brawler, could rush through the monastic gates and shelter himself in this den of crime. Here, also, harboured picklocks, forgers, coiners, makers of sham jewellery, carders, dicers, and other gamblers. Altogether quite a savoury resort! Stow also chronicles that after the dissolution (in 1548) a large wine tavern took the place of the old college church!"

On July 7, Mr. F. Tharratt, Overseer of the Cable Room, retired on pension owing to ill-health. The best wishes of all old colleagues go with him and the sincerest hopes that freedom from office strain will do more than medicine to restore jaded nerves to something approaching the normal.

Mr. Dalzell has associated himself so thoroughly with the T. and T. Society that his new appointment cannot but deeply interest readers on the Telegraph side, who respectfully tender their sincere congratulations.

The Old Guard of T.S. were once more very much to the fore in the muster they made in Kew Gardens on June 7. Upwards of 130 veterans of the supervising Telegraph Service assembled, many having travelled from considerable distances in order to meet old colleagues and to exchange hand-grips, which latter sometimes express more than mere words. Though a veteran's gathering there were those present who had not yet touched the sere and yellow period, as for example the grand-daughter of a T.S.-ite who retired as far back as 1883! The weather was ideal and the "ALL OUT" call but too soon for many of the visitors who lingered long within the gates of this beauty spot and when outside the gates apparently found it difficult to say "Good-bye."

On July 4, American Independence Day, the German Telegraph offices notified their various correspondents as follows:—"*Zu einer Kundgebung fuer die Republik ruht hier der Betrieb von* 3 *bis* 3.10 *uhr.*" This desire for ten mintes' silence in honour of the republic was duly observed by the offices in direct communication with the various German telegraph centres.

From *The African World* it is understood that a private firm has offered the Government a scheme for broadcast wireless telephones throughout the Union, the cost of which would be recouped by the sale of receiving instruments at from £5 to £10. It is considered that "the scheme will prove to be a valuable educative influence on the Veld." This latter, judging from what one has read of broadcasted matter emanating from certain quarters, would certainly depend on the nature of the programs. The Minister of Italian Telegraphs stated a short time ago that the wireless traffic in Italy had increased from 700,000 words in 1919 to 4,834,000 in 1921.

The *T. and T. Age* of America states that Major-General G. O. Squier (so well-known to members of the I.E.E.) has invented a new development in wireless telephony by means of which speech can be received by attaching the usual receiving set to an electric lighting circuit and eliminating the antennae. One is not sceptical but it would be just as well if amateur wireless folk were to hesitate before tampering with the connexions of the local electricity supply. The results might not be as satisfactory as the press-man has indicated!

With reference to other paragraphs regarding the developments of trans-Atlantic cable telegraphy, the following condensed account of the report of the directors of the *German Atlantic Telegraph Co.*, of Cologne, which by the way is the first report issued since 1917, will prove of interest to readers:—

> "The cable sections ceded under the Treaty of Versailles included the greatest parts (7,361 nauts) of the two cables between Borkum-Fayal and New York and the Emden-Vigo cable of 860 nauts. There remained in the possession of the company three sections, from Borkum to the Straits of Calais, as well as two sections on the Spanish and American coast, of a total length of 1,335 nauts. The question as to the bases upon which Reich compensation was to be calculated and as to the manner in which payment was to be effected had not yet experienced a definite legal settlement, although the negotiations were expected to be concluded in the near future. The accounts for 1918-19 show a loss, and those for 1921 net profits of 1,370,000 marks, including the balance forward. It is proposed to pay a dividend at the rate of 5 per cent. for 1920. The participation in the North German Marine Cable Works is booked at 3,000,000 marks. With the assistance of the compensation from the Reich, and the amalgamation of the company with the German South American and East European Telegraph companies it is proposed, in the first place, to establish a cable between Emden and Horta (the Azores), which will there have a connexion with a new cable betweeen Horta and New York, belonging to the Commercial Cable Co."

It may be recalled in this connexion that the directors of the Mackay Companies in their report to sharcholders, dated Feb. 15 of the current year, therein stated that the Mackay interests had entered into an agreement with the German Government on Jan. 17 for the laying of a cable *via* the Azores to Emden which was to be open for traffic by October 1923.

Further permission is being sought from the American Government, and by this time may have been granted to lay a second Pacific cable. A cable from New York *via* the Azores to France has also been decided upon *and power to deal direct with the public in France is being sought.* It would be no surprise to the well-informed in this country if the italicised portion of this proposition were to receive the hearty support of a number of influential people across the Channel.

Mr. T. W. Stratford-Andrews, Chairman of the Radio Communication Co., Ltd., has made a suggestion in connexion with distress calls from ships at sea which deserves serious attention. It is simply the substitution of

Digitized by Google

the present SOS signal by what he terms the bugle-like call of DDO repeated three times with a pause after every three repetitions. It is, in fact, an old call adopted many years ago by the Indo-European Telegraph Co. for calling the attention of all stations along the line at any desired moment. Telegraphists will doubtless appreciate the rhythmic attraction of this suggestion. Its introduction, however, would need to be accepted at a sitting of the next Radio convention before it could become internationalised.

New London offices have been secured by the Commercial Cable Co. in Wormwood Street, so that there appears to be a gradual movement of the telegraph companies towards, and even over, the northern boundaries of the city proper of the Metropolis. The Eastern and Spanish companies have for some years occupied Electra House near Moorgate Street Station, the Marconi Co. have recently moved in the same direction, and the Western Electric interests occupy a site almost on the edge of the boundary line.

An informant of mine in the Antipodes sends me the interesting item that Baudot Quadruple has been working successfully between Wellington, N.Z. and Christchurch for over six months. The line is a mixed one comprising about 16 miles of land line at the Wellington end (300 lbs. copper) followed by 37 to 38 nauts across Cook Strait (about 350 ohms) terminating on the Christchurch side with 226 miles at 3.5 per mile. The keyboards are equipped with Murray keyboard perforators and work at the usual speed of 30 w.p.m. per channel.

As far as one is able to judge at the moment of going to press, the vexed question of the landing of the Western Union Company's cable from the Barbadoes to Miami, Florida, has only been solved to a very limited extent. The shore end has actually been landed with the provisional authority of the United States Government but the cable is to be sealed. According to the Exchange Telegraph Company's information these conditions will obtain until such time as the All America and Western Telegraph Companies shall have given their consent to the abandonment of a policy of exclusive privileges on the eastern and western coasts of South America.

A new international telegraph line has been opened for three months now between Albania and Czecho-Slovakia *via* Antivari and Scutari.

Recent trials of Baudot Double Duplex between London and Prag *via* Emden and Dresden have shown the practicability of telegraph communication over this line and by means of this system. No actual traffic has yet passed up to the time of writing, but given a further stabilisation of the continental land lines it is hoped that the new means of a more rapid service with this energetic new country will soon become a very solid fact. The number of channels available should at present give full scope for traffic development which it is hoped will aid in the mutual benefit of the two countries concerned.

Chance.—Chance will not *do* the work,—Chance sends the breeze,
But if the pilot slumber at the helm,
The very wind that wafts us towards the port
May dash us on the rocks—
The steersman's part is vigilance
Blow it rough or smooth.—*Old English Play, 15th century.*

J. J. T.

THE TELEPHONISTS' COLUMN.

"TALK OF MANY THINGS."

WE are pleased to find that this new feature, commenced last month, is appreciated by our readers. In place of further remarks of ours on the inauguration of this column, we have great pleasure in printing the first contribution received—from Miss Dorothy Turner—and commend to one and all the excellent advice contained therein.

WITH GOOD INTENT.

Eureka! In truth we must confess, that is not a very ladylike exclamation, but when we have explained the reason of our transports we feel sure we shall be forgiven.

Girls, have you realised our triumph? At long last we have been given a whole column of the JOURNAL to ourselves alone. Imagine! A whole column into which no male person may intrude. Never a word of the mystifying "Baudot" will be permitted to appear. Oscillating waves—whatever they may be—will not undulate in these paragraphs. Here we may safely speak on all the thousand and one interesting matters which concern the feminine portion of the telephone world. Hitherto, the JOURNAL has been a purely masculine concern*, containing matters learned and necessary even interesting from a masculine point of view. These matters could hold out no inducement to us. We had no desire to buy the JOURNAL, simply because we have had no electrical training, and therefore, it is all as Greek to us.

After many appeals, and many gentle reminders that we are greatly in the majority and a force to be properly considered in the Telephone Service, the Editor has conceded us a column. It is now *up to us* to make it a great success. In some measure we feel a sort of friendly rivalry towards the masculine section, and it is, perhaps, excusably feminine if we want to do better than they do. Anyway, we can make a good bid for it. We are not suffragettes. Neither do we *really* desire a vote (who would own to being over 30!) but we *do* like to make our presence felt and take our proper share in the affairs of the day.

We want to do, we *must* do well in this column. So well indeed, that presently we shall overflow into other columns. And even (how alluring the very thought!) the time may come when we shall *be* the JOURNAL! Then, as we are great we will be merciful and say to the gentlemen, "Here are *two* columns for you in which to publish masculine affairs."

We would much like to know more of *you*, our colleagues in the provinces. It would be good to compare notes as to our respective hours of duty. Details concerning your exchanges, dining rooms, rest rooms, social and sports clubs would be interesting to know. Will you not write for us, please, and send your contributions to Miss McMillan, our Editress? She needs all our support and co-operation.

There are two great qualities which are difficult to define, and perhaps for this reason they have always kept the names by which they are known in France. They are *Noblesse Oblige* and *Esprit de Corps*. They are wonderful qualities, and are absolutely necessary to the well being and furtherance of any great and good project in which a body of people are involved. Show that you understand the meaning of it now, O ye telephonists, by writing for the JOURNAL whenever the opportunity occurs, and more especially by *buying* it every month.

Just one little word more let us whisper to you. Don't let anybody read *your* JOURNAL over your shoulder. Tell them it only costs threepence per month, and henceforth it is going to be well worth while.

DOROTHY TURNER.

To judge from the caustic comments still being made by many telephonists regarding the appointment of Miss K. M. Cornish, B.A., to the Savoy Laundry in Clapham Road, they will agree with the remarks of "The Man in the Street" in the *Daily Sketch*,, when he says:—

"Obviously Miss Cornish must be possessed of the qualifications which the manager of the laundry considers necessary in a telephone operator, but what I am wondering is whether these qualifications were acquired as a result of her University training, or in spite of it. The laundry may, for all I know to the contrary, have a very exceptional lot of customers who when they ring up to enquire after the health of their boiled shirts couch their remarks in Greek hendecasyllabics, or they may speak in Latin when asking why it has been thought necessary to remove *all* the buttons from their singlets. But from what I know of laundry customers, although their language may at times be somewhat violent, it is almost invariably colloquial. So I should think that a lady who had never heard of the differential calculus, and was quite unaware that Gaul was divided into three parts would be well able to attend to the 'phone! This appointment seems a little unfair to the telephonists, hundreds of whom, in the words of one of them, "are prevented from graduating through lack of means—*not* through lack of wit and gumption. Certainly it is our experience that our telephonists would have passed with honours that part of the test which required the possession of "Resource," "Observation," "Pertinacity," and "Judgment."

Our knowledge of Greek and Latin has, alas! grown rusty through desuetude; though we all make frequent use of one Greek word, *i.e.*, "Telephone" from "tele," afar, and "phone," sound or voice; and with regard to Latin, we may only dimly remember being told to "learn the declension of Bonus," but we have every reason to remember it now. Four twenty-sixths? Zeus!"

At a "Wireless" dinner at the Lyceum Club, the guest of honour, Senator Marconi, said that when the whole history of wireless came to be written, it would be found that the original inspiration for the discovery came from a woman. We await that history with interest.

THE DEAR REDUNDANT STAFF.

According to the "peg count" we have redundant staff,
Now we can have a little chat, enjoy a merry laugh.
We go downstairs just when we like,
Have cups of tea, and take a "mike."
There's nothing else to do, we can sit and sing,
As the dear redundant staff comes flocking in.

Each morn when early duty all our cords we test,
The sweet subscribers "calling," they never let us rest.
We test some lines from "point to point,"
Until our arms are out of joint.
There's nothing else to do, we can sit and sing,
When the dear redundant staff comes flocking in.

Many of us love our work, we never should complain,
We sometimes wonder if we're mad, or if we're really sane.
With "buzzers stuck" we vainly strive,
The "Service board" keeps us alive
There's nothing else to do, we can sit and sing,
As the dear redundant staff comes flocking in.

We had three girls at eight o'clock, now we've only two.
We mutter signs of protest—but that's 'tween me and you.
To those who rule we humbly say,
We want more staff another day.
The superviser's answer makes we poor mortals "strafe,"
According to the "peg-count," we have redundant staff.

GERTRUDE M. TURNER, *Hop Exchange.*

Contributions to this column should be addressed: THE EDITRESS, "Talk of Many Things," Telegraph & Telephone Journal, Secretary's Office, G.P.O. (North), London, E.C.

* We must claim an exception for the able articles by supervisors, telephonists, and others, not forgetting the Editress of this column, which we have published from time to time.—EDITOR, *T. & T. J.*

LONDON ENGINEERING DISTRICT NOTES.

Valediction.

ON July 4 the Deputation Room in G.P.O. North was packed with representatives of all grades of the Engineering Department who had gathered together to support Major Purves in making a presentation to Sir William Noble on his retirement from the Post Office. Major Purves, in his ingenuous style, reviewed the splendid work consistently performed by Sir William throughout his long career and laid emphasis on his very human qualities.

Speeches were made also by Messrs. McIlroy, De Lattre, Sinnott, Plumber, Moir, and Allen. Mr. Allen, in expressing the goodwill of the Stores Department, said that in the company of P.O. Engineers he always felt that he was among friends. Sir William Noble, in his reply, gave away the secret of his success. He claimed never to have worried either himself or anyone else. This quality together with his love of hard work had the results that ended in his attainment of the high office he recently vacated.

Sir William said he felt exceedingly fit and this fact should help towards a realisation of the wishes expressed at the gathering, that he should live many years of active life before carrying his energies to the next plane of existence.

New Assistant Engineer-in-Chief.

Congratulations to Mr. J. Sinnott, who has been appointed to fill the vacancy caused by the promotion of Major Purves. Mr. Sinnott is a man with an extensive knowledge of the engineering work of the Department, and one with a broad outlook. The new Engineer-in-Chief and his two assistants form a strong team with some years to go before any changes due to the age limit will be necessary. Under the circumstances great progress in the work of the Engineering Department may be looked for with confidence.

Institution of Electrical Engineers.

Congratulations to the Institution of Electrical Engineers on their selection of Mr. Frank Gill as their President for the forthcoming session. It is fitting that an Institution which was originally founded by Engineers interested in communications, should occasionally choose someone from the telegraph and telephone world to preside over their activities. Those who know Mr. Gill's immense capacity for work will rest content in the knowledge that the standing of the Institution will have been greatly improved before his term of office expires.

In the last Annual Report of the Institution, the following special awards were announced :—

Mr. J. G. Hill	Institution Premium	
Mr. L. B. Turner	Wireless	,,
Mr. E. S. Byng	Fahie	,,

These three gentlemen are well known to every member of the Engineering Department and in fact throughout the profession generally.

Mr. Hill is the only one of the three who is at present on the Post Office staff, being attached to the Research Section. Mr. Turner left the Wireless Section of the Post Office some time ago to take up a lecturership at Cambridge. Mr. Byng was at one time on the engineering staff of the late National Telephone Company, and is now one of the "lights" of the Western Electric Company.

Ireland's Loss is England's Gain.

Welcome back to Mr. E. Turner on his transfer from Ireland to the Engineer-in-Chief's office, London.

Mr. Turner, who left the London District on his promotion to the rank of Superintending Engineer, spent a long period as Assistant Staff Engineer in the Engineer-in-Chief's Construction Section, which he will in future control. The occasions on which members of the L.E.D. have dealings with the Construction Section are numerous, and under Mr. Turner's control the relations are bound to be as agreeable in the future as heretofore.

Morkrum Printing Telegraph.

A new departure with reference to local telegraph working has recently been made by the installation at the Borough High Street Branch Office of a Morkrum Printing Telegraph. This system presents some of the features of both the Hughes and Baudot printing telegraph systems. The apparatus, which is very compact, comprises a keyboard transmitter and a printer combined in one instrument. The apparatus is actuated by a small D.C. motor. The Baudot alphabet is used, but the 5 selective impulses are preceded by a positive starting impulse.

The operation of a lever on the keyboard sets up a combination on the commutator springs, from which a revolving spindle transmits to the line the elements of the letter corresponding to that on the lever depressed. The printing arrangement and method of letter selection is very similar to that of the Baudot receiver, *i.e.*, on the same axle as the type wheel are fixed two discs on the rims of which are cut notches arranged in accordance with the Baudot code. The selective levers which fit into the respective notches are actuated by plungers which are themselves selected by the receiving electromagnet in conformity with the letter impulse received.

The receiving mechanism is adjusted to run at approximately the same speed as the transmitting mechanism. A governor is provided for regulating the speed of the motor; the speed being gauged by inspection of equidistant white spots on the rim of a fly-wheel on the motor, by means of two slots in vanes attached to the opposite legs of a forked vibrating reed. The messages are printed on gummed tape, which is affixed to the message form in the ordinary way.

The machine at the Borough High Street Branch Office is designed for simplex working, and has been placed at the office mentioned to meet special traffic requirements.

Somerset House Fire Alarm System.

A new fire alarm system has recently been installed at Somerset House and replaces a system of battery signalling bells which has hitherto served the purpose.

The new installation consists of 46 telephones, No. 47 wired in six separate groups serving the separate wings of the buildings to a special C.B. switchboard fitted in the Police Office. In addition, a Gamewell Indicator System is installed by means of which the number of any station from which a fire call is received may be signalled from the Police Office and registered on the indicator fitted in the extrance lobby of each wing. The instruments forming each separate group are wired to a strip of ten jacks, and eyeball signals *via* ringing keys, which are linked in two groups of five.

The calling signal on the switchboard is operated by the removal of the receiver of telephone No. 47, and in the event of a fire call being received, the whole of the bells in the building would be rung by the starting up of a dynamotor and the throwing of all the linked ringing keys which lock in the ringing position. The position of the fire would be signalled to the Gamewell indicators in the various wings immediately after the alarm bells had been operated by the Officer-in-Charge. The position of the fire would be signalled by the selection of a toothed wheel—one of which is provided to correspond to the number allotted to each station—its insertion in the Gamewell transmitter and the depression of a lever. On the operation of the alarm bells, the constables in the various wings are instructed to proceed to the entrance lobby in their particular wing and to ascertain the position of the fire from the Gamewell indicator.

An emergency ringing supply is provided by means of a power ringing lead from the Central Exchange, but in the event of the use of the emergency supply, the ringing keys would be thrown in the reverse direction to that of the local machine ringing. The former position is non-locking, and one group only—two sets of five keys—can be rung simultaneously as the keys need to be held in the ringing position. This is necessary as efficient ringing could not be obtained were the whole of the bells connected simultaneously to the power lead.

Two 14 Cell Leclanche batteries have been provided, one battery serving the Gamewell System and the other the fire alarm telephones and switchboard. Switches, however, are provided so that the two services may be connected to either battery in the event of fault or for maintenance requirements.

The whole installation has been subjected to very close examination and tests by officers of the Office of Works, Inland Revenue and Post Office Engineering Departments, and has been accepted by the Office of Works and Inland Revenue Department as entirely satisfactory.

New County Hall. Telephone Installations.

By the time these notes appear the opening ceremony of the New County Hall will have been performed and general descriptions and photographs of the building will no doubt have appeared in the daily Press. Much time and thought have been devoted by the members of the Engineering Department to the telephone installation, and it is believed that the following information may prove of interest as supplementary to that which may appear elsewhere. During the War that portion of the building which was at all habitable was adapted by the Office of Works and occupied by the Food Ministry, and a telephone installation of considerable size was provided by the Post Office.

The installation was of a temporary nature; the cables which ran from the switchroom to those parts of the building occupied by the Food Ministry officials terminated on distribution cases in rooms and corridors, and internal or office wires were run aerially through rings to the different instruments. The permanent installation is, however, of a very different character. The switchboard, which is of the No. 9 multiple type, has 10 positions equipped with a multiple for 600 circuits and is that which was installed for the Food Ministry. It is intended to replace this ultimately by an automatic exchange. The main frame has a capacity on the external cable side for 2,760 pairs, and on account of the vast size of the building and the necessity for fitting as many distributing points at the outset as possible, the external cable provision has been liberal, hence the greater portion of the external side is already appropriated.

One of the requirements of the L.C.C. in connexion with this installation is that no wires or cables shall be visible when the installation is completed, and this applies equally to the Council's own plant as well as that of the Department. Ample arrangements have, therefore, been made in corridors, in rooms, and between floors for the various services, *e.g.*, electric light, power, heating, bells, telephones, &c. Beneath the floor of each corridor is a duct-way that extends the whole width of the corridor and is about 18 inches deep, access to which is gained by man-holes suitably placed. Steel conduits are run through this duct-way to accommodate the telephone cables and wires, and at frequent intervals cast-iron boxes with covers are fitted. From these

Digitized by Google

cast-iron boxes other conduits are run into the individual rooms. The end of the conduit terminates in a metal trough which runs round the room behind the skirting-board.

The building is divided into eight blocks or sections, and the rising mains of the various services are brought out into a control room on every floor in each block and as there are eight floors, it will be seen that there are sixty-four control rooms. In each of these control rooms, the Department has fitted a distribution case on which the cable from the switchroom is terminated, and from this distribution case the wires pass through the conduits, joint-boxes and troughings to the various instruments.

It will be realised that the quantities of material used in this installation have been considerable. There are approximately six miles of steel conduit and over three hundred cast-iron junction boxes, both these items being provided and laid by the L.C.C. for the Department. Already seventeen miles of flameproof cable (1 pair) has been run, to say nothing of the large lead-covered cables which connect the main frame to the various control rooms.

The distribution cases which, as before mentioned, number sixty-four, vary in size and accommodate from twenty to a hundred and sixty wires.

It is believed that the method of installation is unique, and it was not without considerable discussion at the outset that the method of cabling the building was decided on.

The practice of leaving draw wires in conduits was not followed in the construction of this installation, steel tapes having been used instead of draw wires.

At present there are 500 extensions working and at the time of writing an order has just been received for a further 50 with a request to increase the multiple capacity by an additional 100 circuits.

In concluding these notes, it is pleasant to be able to place on record that the relations with the L.C.C. Engineers, the Contractors staffs, and the Department's Engineers and workmen, have been cordial throughout the work.

LONDON TELEPHONE SERVICE NOTES.

Away Dull Care.

THE holiday season being in full swing, each week-end finds us bidding *au revoir* to one or other of our colleagues, and on Mondays we greet others on their return to the common task. One hears glowing accounts of well known and also of obscure places on the coast and inland as well as abroad, the most wonderful stories being related by those who have spent their leave in Germany or Austria. Although the spending power of the English pound is not so high as it is represented to be by the rate of exchange, the number of marks obtainable for that amount gives the visitor a sensation of unusual affluence. One colleague just returned relates how he was host to a party of eleven at a dance, considered to be most exclusive, the total cost to him being equivalent to fifteen shillings. Another, it is said, had to walk a hundred miles as a result of changing a five-pound note, there not being accommodation on the train for him *and* his money.

Not long ago a newspaper published letters from some of its readers protesting that women in the Civil Service should be in a position to afford holidays in Switzerland. Apparently we can do nothing to please certain of our critics, but in the matter of holidays at least we may claim to please ourselves. There is an interesting sidelight in this connexion. There is a fund called the Children's Country Holidays Fund, which provides for holidays for poor school children in need of a stay in the country, who cannot otherwise go on a holiday. The Post Office collection amounted to £1,742 12*s.* 0*d.*, the L.T.S. contribution being £103 17*s.* 0*d.*, taking second place to the Engineer-in-Chief's Department. We are not, therefore, unmindful of the needs of others. In the yearly report of the Fund, just to hand, some extracts are given from letters written by the children. The following is a gem: "Pigs eat almost anything, and they deserve their name."

* * * *

Exchange Names.

Following upon last month's notes on the derivation of "Maryland" two others are given in brief. "Maida Vale," was named after the Battle of Maida, a place in Calabria, Italy, where on July 4, 1806, the British defeated the French under Reynier.

"Minories" is derived from an old Convent of Minoresses (Sorores Minores) or Nurses of St. Clare, the old church of which is represented by the Church of the Holy Trinity (rebuilt 1906) in Church Street leading east from the Minories.

* * * *

Langham Choral Society.

This Society will commence its season's activities earlier than usual on account of its having undertaken the organisation of a concert at the Crystal Palace on the occasion of the Post Office Fete Day on Saturday, Aug. 26. The Choir will sing Elgar's "Banner of St. George," and a miscellaneous performance will also be presented for which Miss Beatrice Miranda and Mr. Barrington Hooper have been engaged, and it is hoped to add the name of Mr. Joseph Farrington.

The Hon. Sec., Mr. W. R. Child, of the Contract Branch, will be glad to hear from anyone who would like to assist in the Choir on this occasion. The rehearsals will be held at the "Rangers" Hall, Chenies Street, W.C., on July 25, Aug. 15 and 22, at 6.30 p.m.

Culled from the Exchanges.

Gerrard Exchange.

We have had some excitement this afternoon. For the first time the exchange staff have been posing for the Cinema, and doing it very well, too.

From 1.30 onwards the Western Electric Company have been busy getting the lights ready. Of course we only saw a portion of the room lit up, but it was like nothing we had ever seen for brightness. It is understood that the cost of lighting the whole exchange for a photo would be 300 dollars. When the Cinema operator actually did arrive with his suite (a small army with a big accent) the staff on duty, and those who elected to stay behind, had quite an interesting experience of how a moving picture is taken with artificial light. It is very sad that this wonderful radiance entirely effaced the subscribers' calling lamps, but as we received no complaints ,we hope and trust nothing will happen; as we say after a "Fire Drill." Of course we are principally thinking of the observation results.

The photos were taken from the "A" side, both ordinary and slow movements. Then the "B" positions were taken, showing up the high multiple. Of course, the Special Enquiry being the highest point, the staff got very busy with these circuits for a few moments, giving quite a spectacular effect to the proceedings. The testing position came next, and it was funny to watch the Cinema operator close up to the position directing the movements of the voltmeter, which was permitted only dignified movements. In fact it was made to understand that it was having its photo taken. Of course we are prejudiced, but we think that the girls who operated for the picture looked very nice, and we hope that the result will be worthy of them and of our Exchange.

Regent.

"WHY, THEREFORE . . . ?"

Full oft I've sat and pondered me
On many vexing things that be,
And one did most perplex my mind
Yet no solution could I find.
Methinks, I'll hie me to a sage
And seek his counsel to engage.

"O Great and Brainy one," I quoth,
"Give me your wisdom, learning—both."
I' faith I cannot but perceive
When supervisors go on leave
Or lack-a-day are sick, mayhap,
An operator fills the gap
That supervisors well may fare
And do no more than is their share.

Yet we are absent by the score
And no one bothers to restore
Our ranks to meet the urgent need
Of spaces, gaps they take no heed.
And oft we're in a sorry plight
Th' adjacent one is lost to sight
So many spaces intervene."

The Sage replied in tone serene,
"But what of the 'Redundant Staff'?"
At this I scarce forbore a laugh,
For sooth, 'twas humorous to think
That one could thus a Sage hoodwink.
"Redundant they are *called*, 'tis true,"
I answered him, "Yet if you knew
Experiences teach. Indeed
They only meet our normal need."

The Sage then reasoned thus with me—
"O Foolish One, can you not see
That supervisors surely are
The most important factors far?"
And humbly, for I feared to vex,
I begged "Forgive, it doth perplex
Me still, for if it should befall
We'd ne'er a 'super' left at all,
Subscribers would not have a care
If *operators* still were there.
But just suppose that we were gone
Who would there be to 'carry on'?"

The Sage assumed great dignity
And waved his hand dismissing me,
Remarking as I turned away
"You've wasted all my time to-day.
I'm known for wisdom, learning great,
I engineer Affairs of State,
But . . . this he said with pride immense—
"I do not deal in *Common Sense*!"

EXTRACTS FROM LETTERS HOME OF A YOUNG TELEPHONE ENGINEER.

(SENT OUT TO INDIA TO INSTAL THE FIRST AUTOMATIC SWITCHBOARDS USED IN THAT COUNTRY.)

Calcutta, May 13, 1921.—We've four natives in the office as well as the coolie boys and the chokra—a little messenger boy, aged eight, with big brown eyes and a snowy white turban; he's a pretty kid. There's the storekeeper and cashier—a tall thin man with a wonderfully gentle voice—clad in an English shirt and a linen sheet, with a white ruffle round his neck. He sits and chews pahn—a weird native concoction of leaves and betel nuts and lime and other things—and deciphers the most atrociously-written stores-chits which the operators can produce. The way in which he can read a language foreign to him, written in writing far far worse than this, is very wonderful—he rejoices in the name of Ok-eye. Then there's little Gobbin, the typist—a poor, little deformed chap—earning twenty-five rupees a month—just a shilling a day. He has lately betaken unto himself a wife, aged seven; and last, but in no sense least, there is Durga Dass, the letter clerk and amateur actor. On the morning after his great success he told S., that his uncle, a very famous Bengalee actor and partner in the Monomohon Theatre (I was introduced to him when I went "round the back," he was in his office lying on a couch smoking his hooka; the respect the natives showed him almost amounted to worship), had offered him eighty rupees a month to act for him. Asked why he didn't take the job when the Company was only paying him 30, he stammered: "I c-c-an't l-l-leave my f-friends in the office—m-m-money i-isn't everything w-with *us*."

May 31.—Working down at the Telephone School is great—only you can never get a move on properly because they keep having holidays. Last Saturday was the last in the month so we had to shut down. Next Saturday is the Emperor's birthday so, of course, we've got to shut down again, and so on. The voyage made a terrible mess of the switchboard—it was all bent about and twisted to the dooce. However, I got busy on it with a good heavy hammer and a crowbar and it don't look so bad now. We got the battery on it to-day, and although we weren't able to get a call through as all the wires were not joined up, so far as it went it wasn't so bad—one or two "bugs" here and there, but that, of course, is expected and only makes it more interesting.

Thursday, June 9.—This holiday stunt is getting beyond a joke. Yesterday and to-day are holidays again—Muhammed's birthday—how he can have a birthday on two days I don't quite see—but there it is. Id-ul-Fitr, they call it. It's very convenient having so many religions here; you see, as this is a Muhammedan holiday you can still get a taxi driven by a Hindu, or ride in our lift driven by a Brahmin. It's only the Christians who are sufficiently broad-minded to recognise all the holidays. I like the Muhammedans best—they're far more refined than the others, far more logical, they call the Hindus "Jungle-Wallahs"—a wonderful epithet—a thousand times more effective than "fool" or ass (even when rhymed with "glass"). It implies that they're poor, ignorant fellows, irretrievably on the wrong tack, obstinate, deserving of pity and a thrashing at the same time, a hopeless case, and so on. Yesterday, the Muhammedans finished their forty days fast—Ramuzan—they ate or drank nothing between 3 a.m. and 7 p.m. all the time. Out on the Maidan forty thousand of them formed up in a great square to pray, attired in every colour of the rainbow, with a generous use of gold lace. They all stood stock still in the sunlight and the fresh morning breeze, arms folded, heads bent. Then, altogether, the first line went down and touched the earth with their foreheads—then the second line, then the third, and the wave ran right back to the other side of the square, and all you could see was the roundnesses of forty thousand gay-clad backs. Then the wave ran across them again, like the wind in a cornfield, and then arose wailing "Alla-a-a-h, Alla-a-h." After he'd finished his devotions my boy came home and gave me the sack, as he was going for a holiday. That's what they do, you know, work for a few months and save a few rupees, and then go off on a holiday. If you have a motor-car they take it along with them usually, and the police will find it for you all smashed up and left by the roadside. I think it's rather inconsiderate.

June 19.—Since I have started working I have fallen into some sort of a routine and there is not much happening "to write home about." Take to day for instance: I gently slid from sleep to a sort of semi-conscious state to the sound of Abdul's voice whispering: "Sahib! Sahib! Chohtah hazree hai!" (early tea is ready). Then I ate the bananas and toast, drank the tea and went off to sleep again while he got the bath ready. Eventually he managed to wake me again and I staggered to the bathroom, went through the daily ritual of telling him that he had made the water too hot (he always has done and always will) and then bathed, was dressed and went in to breakfast 8.30 a.m., wrote a few letters, smoked, looked at the papers, and then went around with S. to the music shop to help him choose some rags to send to his spouse,—called in at the book shop, bought "Our Mutual Friend"—taxied home to see if the mail had come in,—it hadn't, of course, it was only due last Saturday—to-day's only Tuesday—then off to Alipore where the Tele. Stores is—that's just over two miles away; the storeyard is a sort of park with the river at the bottom of it; arrived about 11 o'clock, lit a pipe, said "good morning" all round the engineers, received profuse salaams from the wiremen, porters, messenger boys, and so on, and then found Mendoca, the Indian I'm teaching the Relay system to. We joined some other Indians and discussed non-co-operation (a kind of Indian Bolshevism—I don't know anything about it, but M. says it very wicked—he's a very decent sort of chap), Monsoons, languages, University training, and eventually tactfully brought ourselves face to face with the work on hand—then we broke away for Tiffin. After Tiffin we had some more discussions and worked round to telephones about 4 p.m. Then gave the wiremen instructions what to do to-morrow—which is a Hindu holiday—the wiremen are Mohammedans, you know—and went on our way rejoicing.

C. G.

(To be continued.)

CORRESPONDENCE.

TO THE EDITOR OF THE "TELEGRAPH AND TELEPHONE JOURNAL."

DEAR SIR,—Mr. Polley apparently takes exception to the statement in my notes—when comparing the five-unit system with the Morse code—that "The object to be achieved in substituting multiplex systems for Morse working, is to fill the line." This article was not written with the intention of making a comparison with any particular system, but to show the comparative difference in length between the codes used in inland working.

It is not claimed that thirty words per minute is obtained in actual working. This is practically impossible with the five-tapper keyboards, and a distributor speed of 180 revolutions per minute, but the day may not be far distant when keyboard perforators, with possibly, a distributor speed of 240 revolutions per minute, will take the place of the five-tapper keyboards on the more important lines.

Mr. Polley also states that "in reality a comparison between Wheatstone and Baudot does not concern the respective alphabets in any way." I have little hesitation in saying, that if the five-unit code were adaptable for Wheatstone working, the Morse code would cease to be used for that purpose.

HOW CAN WE IMPROVE THE USE OF OUR LONG-DISTANCE TRUNK LINES?

BY F. LANGE. (Frankfurt-am-Main).

(Translated and Abridged by H. W. CAMP, *from "Telegraphen und Fernsprech-Technik.")*

THE long and heavy trunk lines of the State Telegraph Administration have become so valuable on account of the permanent rise in the cost of labour and material that a close examination of their use appears desirable, especially as the bad financial position of the State necessitates a drastic economic handling of its sources of revenue.

In order to determine closely whether the system of working the long distance lines is economically sound, the expenditure and revenue should be compared and the tariff question investigated. It is not proposed to deal with the latter point here, and we shall confine our examination to whether the system of working exhausts all revenue possibilities or what loss of revenue occurs and the reasons for the loss (lack of system or of lines).

We shall, therefore examine: (1) How many speech units ought to be normally carried by the lines during the working day or hours; (2) To what extent the present results are behind the normal values working; (3) What loss of revenue arises; (4) What improvements suggest themselves.

To be able to determine safely how many speech-units should be normally expected from a trunk line during the day, extensive statistics are required in order to see how the tariff should develop under given circumstances. For this purpose, records are used which show a continuous and close examination of trunk line working. The records also show to what extent the regular day period is used for traffic in relation to the lines at one's disposal.

Now we come to the essential point—how many of the 60 minutes of the working hour are revenue-earning and how many are lost? Non-revenue earning time arises:

1.—By the passing of service communications between the telephonists at each exchange (other than the passing of required numbers), the method of working, passing forward "urgent" calls, cancellations, queries *re* duration, &c.

2.—Through the calling of the subscribers (calling, waiting for reply, testing, engaged number, explanations between subscriber and telephonist, misunderstandings, wrong local connexions, faulty junctions, &c.)

3.—Hindrances to supervision on account of having other lines to operate, passing information, pricing or because the telephonist is lazy.

4.—Through faults—,

(*a*) Lines completely out of order.

(*b*) Faults developing during the working and creating difficulties

STANDARD TRAFFIC VALUES OBTAINED BY MEANS OF OBSERVATION OFFICE RECORDS.

Frankfurt Trunk Exchange possesses an Observation Desk served by two telephonists to which the trunk line and the telephonists' transmitter set can be connected. The telephonists enter the results of the observations in a book in the form which, according to general experience, is considered the best. See Table 1.

Although the Frankfurt desk does not compare with the size of the exchange, the observations have already proved valuable. The satisfactory carrying on of the trunk working as a result of this permanent supervision can only be mentioned incidentally. More important is the creation of extensive statistics which, with the current exchange statistics *re* loads and faults, enable a correct solution to be found for a series of economic and technical traffic questions.

All observations of separate events depend upon the existence of data of a universally valid nature, and of standard value with which a comparison must be drawn in every case.

The main questions, therefore, are as follows:—(1) With how many speech-units can a trunk line be loaded? (2) what period comprises a standard speech-unit? (3) in what proportion is the duration of the speech -unit distributed according to the actual speaking time of an effective conversation and the unoccupied time? (presenting subscribers, &c.) (4) how does this proportion change on account of the differences of position-loads and the introduction of the summer system of operating?*

* Summer system of working. A phantom circuit is made up and over this circuit all service particulars are passed so that the physical lines are used solely for subscribers conversations.

TABLE 2.

Line load on Position.	Duration of actual speaking time. (undisturbed) on unit of conversation 3 minutes.	Ratio of actual speaking time to unoccupied time.	Duration of speech unit	Number of speech unit in the working hour.	Resultant time used.	Loss through defective working lines.		Remarks.
	Minutes.	Minutes	Minutes.	Minutes.	Minutes.	Minutes.		
1	2	3	4	5	6	7	8	9
(*a*) Two lines ...	2.50	1.27	4.45	13.0	57.5			The figures in columns 5 and 6 are rounded up
(*b*) (*c*) One line as 2 ...	2.50	1.74	3.95	14.5	57.5	2.5		
Summer System ...	2.50	2.59	3.48	16.5	57.5			

The degree to which a trunk line is used for traffic depends upon the condition of the line, the efficiency of the telephonists at each exchange, the local conditions within both areas, *i.e.*, the number of exchanges in the area, their size, traffic peculiarities of the important subscribers (banks with large P.B.Xs, large staff with several departmental heads where time is lost in obtaining the required person), and also the number of lines working on the trunk exchange position.

If one line only is connected to a position, the traffic output of the line is much higher than if two are connected. Still further improvement is obtained by the introduction of the summer time system of working for the passing of particulars of calls and other service communications. To what extent the working is improved by loading the position with (*a*) two lines; (*b*) one line; (*c*) with one line under the summer time system has yet to be investigated. An advantage from the economic standpoint is that all calls are not of three minutes duration. Great assistance was obtained from the Trunk Exchange records relating to the traffic load of each line. These records were taken on two consecutive days of each month. About 100 suitable examples mostly obtained from the long-distance lines, were compiled. Unsatisfactory examples were not included as these were usually due to faults the effect of which must be excluded if it is desired to obtain an idea of the traffic efficiency of a line. The effect of faults must be considered specially.

The records showed that more than 200 units were obtained during the 14 hours working day, *i.e.*, more than 14 units per hour. An outstanding feature is that in many instances the number of speech units exceeded 200. We shall therefore not calculate too highly if we determine that a physical circuit (free from faults) ought to carry 180 speech-units during the 14 hours working day, *i.e.*, 13 units per working hour.

For the phantom circuits the average was about 120, but for considering the standard efficiency, this figure does not possess the value obtained from the physical circuits as the phantoms suffer from such serious line faults that, from a normal point of view, a standard cannot be determined. It is, however, desirable that the traffic output of a phantom circuit should not fall much behind that of a physical circuit and therefore the standard loading of a phantom should be about 160 speech-units for the 14 working hours, *i.e.*, 11.5 units for the working hour.

The total time of the standard speech-unit is made up from the period which includes the actual conversation time and the unoccupied time. From a large number of observations it was noticed that the conversations were affected by good speaking conditions and by lines free from faults. In particular the average time was ascertained during which the subscriber spoke. This proved to be 2.50 minutes.

Cols. 3 and 4. The proportion of actual speaking and unoccupied time must differ according to the position load and whether or not the summer time working is in force. From numerous records relating solely to uninterrupted conversation the following was obtained :—

Ref. Table 2.			Working on Position	Proportion of actual speaking time to unoccupied time in the hour.
(*a*)	...	...	2 lines	1,27 : 1
(*b*)	...	...	1 line	1,74 : 1
(*c*)	...	...	as for (*b*), but with summer time system.	2,59 : 1

The duration of the standard speech-unit is therefore :

(*a*) ... ... $2.50 \quad 1+\frac{1}{1,27} = 4.45$ minutes.

(*b*) ... ... $2.50 \quad 1+\frac{1}{1,75} = 3.95$ minutes.

(*c*) ... ... $2.50 \quad 1+\frac{1}{2,59} = 3.48$ minutes.

We now obtain :

			Working hour.		Units.	For 14 hours working day.	Units.
(*a*)	...	...	60	: 4.45	= 13.48	14 × 13.48	= 188.72
(*b*)	...	...	60	: 3.95	= 15.19	14 × 15.19	= 242.66
(*c*)	...	...	60	: 3.48	= 17.24	14 × 17.24	= 241.36

The figures thus obtained agree satisfactorily with those shown in the yearly statistics, but it should again be pointed out that all standard figures relate to lines free from faults. For a long-distance trunk line, the utilisation of the working hours is shown in Table 2.

Digitized by Google

AN EXAMINATION FROM THE ECONOMIC STANDPOINT OF THE WORKING OF ELEVEN TRUNK LINES OF THE FRANKFURT MAIN—BERLIN ROUTE.

In what proportion this standard value compares with present day conditions of work will be shown by a practical example. Further enquiry will be made as to what proportion of the deterioration of line utilisation can be traced to lack of system of working or defective lines. Eleven trunk lines of the Frankfurt Main-Berlin route have been selected for the investigations—eight physical circuits and three phantoms. The fee for a unit call under the old rates was 4 marks for calls over 10 of the lines, and 3 marks for the remaining line.

The following statement obtained from the yearly figures shows the average daily load on these lines :—

TABLE 3.

No.	Line No. Physical.	No. of speech units per day.	Remarks.
		Physical Circuits	
1	227	130	Yearly average obtained from the monthly record (two consecutive days per month).
2	228	153	
3	1,244	150	
4	10,120	150	
5	3,870	70	
6	3,871	80	Working day = 14 hrs.
7	10,689	150	
		1,016 : 8 = 127 : 14 = 9 units per hour.	
		Phantom Circuits	
9	227/8	60	
10	1,244/10,120	70	
11	3,870/1	44	
		174 : 3 = 58 : 14 = 4.1 units per hour.	

The above table shows that the average output for the working hour was 9 units per line for the physical and 4.1 units for the phantom lines.

Trunk lines that are so much in demand that "urgent" calls only can be effected during the working day, ought to be so well utilised that the utmost is obtained from them. This is not so if lack of system, or, what is the same thing, lack of arrangement of the system, stands in the way. One might certainly be entitled to demand the highest standard value for the working hours, viz., 16.5 units (see Table 2, (c), Col. 5), but even compared with the lowest figure the difference is very great. We will now elucidate the causes of this difference.

An examination of the working hour proves the following :—the product obtained from the number of speech-units and the duration of the actual uninterrupted conversation time within the standard speech-unit gives the actual conversation period. The physical circuits thus show 9 × 2.50 mins. = 22.50, the phantoms 4.1 × 2.50 mins. = 10.20 minutes.

For calculating the normal unoccupied time we shall take as a basis, not the highest figure, but an average $\frac{1}{1.50}$ as the ratio of unoccupied time to actual conversation time. For the normal unoccupied time we get 15 minutes for the physical and 6.8 minutes for the phantom lines. This must be considered as unavoidable lost time. To these values are opposed the actual unoccupiied periods arising from the working of the lines. These values were obtained from a large number of observation office records and gave 24.50 minutes for the physical, and 26.20 minutes for the phantom lines. The relative figures are shown in Table 4. The lost time shown in Column 5 occurs on account of the system of working and this has yet to be examined. The lost time shown in column 6 was occasioned chiefly by line faults. Defective line conditions prejudice the working in two ways. If the defects are important enough they completely put an end to the utilisation of the line. With smaller faults the working is still good, but it will eventually deteriorate more or less.

TABLE 4.

Type of line.	Duration of paid speaking time (total of speech units × by the Standard duration of a conversation). Minutes.	Total losss in 60 mins. Minutes.	Unavoidable Loss. Minutes.	Unoccupied lost time by defective working. Minutes.	Other losses (faults, bad transmission, &c.) Minutes.
1	5	3	4	5	6
Physical	9 × 2.50 = 22.50	37.50	15.00	9.50	13.00
Phantom	41 × 2.50 = 10.20	49.80	6.80	19.40	23.60

To what extent the eleven lines under consideration were useless for traffic purposes is shown by the following closely-checked fault returns. The faults for the eleven lines during a working year show that a total of 4,090 hours were lost on the 8 physical lines, and 2,046 hours on the 3 phantoms. Calculating 300 days for the working year at 14 hours per day we show a loss per hour of 7.2 minutes and 9.6 minutes respectively.

The periods indicated in Table 4, col. 6, are the remaining portions of the total time lost and these periods arise from faults which, while harmful to the working, do not make it impossible. A clear indication of the loss of revenue is shown by the following records :—

TABLE 5.

Date.	Line.	Duration of Call Minutes.	Fees.	Remarks.
15.3	221/228	4.15	1	Noise and overhearing
14.3	1076/2010	6.15	1	Noise.
15.3	4134/10172	3.45	1	,,
18.3	4125	8.20	2	,,
17.3	3870/3871	4.50	1	Noise and overhearing

		10.00	2	Noise

The fact that noisy lines increase the telephonist's difficulties must be taken into consideration, and therefore the lost time shown in column 5, Table 4, must be put down as a proportion of the line faults. It can be taken for granted that the normal unoccupied time is increased by line noise (without considering the operator's difficulties) by about 40 per cent. in the case of the physical circuits, and by about 100 per cent. in the case of the phantoms. Six minutes must therefore be reckoned for the physical lines, and 6.8 minutes for the phantoms as indirect line faults. As actual working loss there remains 3.5 minutes and 12.6 minutes. The 60 minutes of the hour are distributed as shown in Table 6. The loss occasioned by the defective lines surpasses that resulting from the want of system of working and amounts to at least 70 per cent. of the lost time.

THE ECONOMIC RESULTS OF THE DETERIORATION IN THE UTILISATION OF THE LINES.

The previous example of the eleven Frankfurt-Berlin lines will again be used. In the following summary the net revenue obtained and the possible revenue are compared. As a result of the deterioration the administration loses about 2.5 million marks a year. In view of the earlier investigations it cannot be said that the possible revenue is put at too high a figure.

SUGGESTED IMPROVEMENTS.

The necessary requirements for the improvement of the working of the long-distance trunk lines are as follows :—

1.—Single line loading of positions.

2.—The introduction of the summer time system of working.

3.—Long-distance lines to be operated by specially-selected telephonists whose duties can, if necessary, be shortened. Change over from very busy to very slack positions.

4.—Closer supervision of the working by the installation or enlargement of the observation office.

TELEGRAPHIC MEMORABILIA.

WE were pleased to welcome the delegation from the French Telegraph Administration which recently visited this country in order to study telegraph organisation, &c., here. The quartette was composed of Messieurs Leon Raynal and Jacobs, engineers, M. Goerens, Director of the Paris C.T.O., and last but not least our old and honoured friend and author, M. Mercy. They were unfeignedly pleased with their visit and the facilities given them of enquiring into every possible detail which suggested itself to them or to ourselves. A visit to the South-Western District formed one item of their itinerary, while visits to the cable companies also figured in their program followed by journeys to certain provincial offices. Opportunity was taken of many informal conversations concerning matters of mutual interest relating to international communications.

It was with renewed hopes for the future welfare of Anglo-French telegraphy that we bid *au revoir* to our colleagues. The personal friendships made and renewed on this occasion should greatly facilitate a more complete telegraphic *entente* between the two administrations, and to lasting improvements in the public service for which the chiefs of the two administrations concerned are equally responsible

During the same week, by a strange coincidence (it is not often that we are honoured by the visits from two foreign administrations at the same time), Herr Wollin of the C.T.O., Berlin, and Herr Rudolph of the important repeater office at Emden also arrived on a similar mission and were also unmistakably gratified at the cordiality of their reception and the freedom with which they were able to study British methods. Here again interchanges of views on methods of organisation in the two countries represented were freely expressed with what must surely prove to be a lasting benefit to the Anglo-German telegraph service which, despite all the difficulties of post-war conditions, has probably never worked so smoothly as during the last twelve or eighteen months. They also paid a short visit to the new repeater office at North Walsham, and returned to their respective posts in Germany with the confirmed assurance of the goodwill of the British Post Office in matters relating to the Anglo-German telegraphs.

It is sometimes annoying to the writer that this JOURNAL only appears monthly as it is feared that frequently items published in these columns are "a day behind the fair!" This may possibly apply to the following two paragraphs. Perhaps before these words are reproduced in print, in any case German engineers are very sanguine that, before long, they will succeed in telegraphing from Nauen across the Atlantic by means of the Siemens' high-speed printing telegraph at a rate of 500 letters per minute. The maximum speed at which this apparatus is capable of working is twice that rate.

An Italian committee of half-a-dozen wireless experts is on its way to this country and to Germany with a view to visiting Carnarvon and Nauen, and of examining these two stations very thoroughly in order to aid their Government in regard to questions relating to the granting of wireless concessions.

L'Audion is responsible for the statement that the Italian technical press is divided in its opinion regarding the relative values of the Marconi and the Telefunken wireless systems. In certain quarters very decided beliefs are held that the latter is the superior.

From a report by H.M. Commercial Secretary, Santiago, comes an item bearing on this question. It reads :—

"The Chilean Government concluded a contract in October, 1921, with Messrs. Siemens, Schuckert, Ltd., in consideration of which, for the sum of $1,385,000.00, the contractors agreed to erect eleven radio telegraph stations at Santiago, Valparaiso and Punta Arenas, all capable of communicating with Buenos Aires, and at Iquique, Antofagasta, Taltal, Tocopilla, Caldera, Concepción, Valdivia, and Chiloé, with a maximum radius of 1,550 miles. The system to be installed is the Telefunken."

And, strange to say, from the same source, originates a paragraph which relates how in the following month of the same year the editor of an Italian paper published in Buenos Aires visited the same country "with the object of interesting his compatriots in the proposed laying of a submarine cable connecting Italy with South America." Some details of this rival to the two above-mentioned rivals have already appeared in these columns.

The Directorate of British Civil Aviation, Great Britain, France, and Belgium have prepared a vocabulary of standard phrases in English, French, and Dutch. Each phrase and word is numbered for the benefit of operators unacquainted with languages other than their own. With this code the only parts of a foreign language a pilot or ground wireless operator need know to carry on a conversation are the numerals, the code consisting simply of the figures 1 to 85, each figure representing a phrase dealing with such matters as weather, illness, time, and position. For example, the operator of an air station who hears "70" knows to "Arrange for a doctor." The code number "44" is a request for weather conditions, and "48" conveys the news "The sun is shining."

There will, therefore, be no need to puzzle one's brains over the correct meaning of one's French telegraphist colleague as when the latter rattles

BONAPETIMRS !

Through the medium of the *Electrical Review* we cull the interesting information declared by M. René Corteil of the Wireless department of the Belgian telegraphs. The Belgian Government, as is known, have decided to erect an immense wireless trans-oceanic wireless installation at Ruysselede, for communication with the U.S.A. and the Belgian Congo. The State would have to install the feeder lines and the telegraph and telephone lines, and these and other works would increase the total expenditure on the station to 20,000,000 fr. The station will extend over an area of 350 acres, having a length of 2,035 metres and a width of 700 metres. The antenna alone will cover 118 acres, and the power of 500 kw. will be furnished either by one or two alternators.

From the same source it is understood that a contract has been granted for the construction of a wireless station near Tegucigalpa (Republic of Honduras). There will be two towers, each 458 ft. in height, and direct communication will be furnished with the United States. It is expected that the station will be in operation next month, while the total cost is not expected to exceed 350,000 gold dollars (£70,000).

Also that the Government of the Republic of Nicaragua has authorised the Tropical Radio Telegraph Company to erect and operate wireless stations n or near the capital Managua as well as the towns of Bluefields, Cape Gracias à Dios, &c.

Writing on Imperial Wireless some few weeks ago, *The Times* made the following very interesting remark :—" We infer from the Postmaster-Gerneral's statement (in the House of Commons)that the advice of the Norman Committee is to be followed, at least in England and in India ; the stations are to be constructed by the Imperial Government, not by a private company. Apparently, also, they are to be managed by the Governments—a wise decision in a matter on which at any moment the vital interests of the Empire may depend."

The thought that runs through one's mind regarding this " wise decision " so much bound up with the interests of the Empire is insistent. When the interests of the Empire are really thought to be at stake and it appears to be something which must be done well and thoroughly, then entrust it to a State department. After all the telegraphs of Great Britain cannot be quite so badly managed if our leading daily journal considers it a " wise decision " to place the Anglo-Indian wireless service in the hands of the Post Office staffs.

According to *Eastern Engineering*. The Compagnie Générale de Télégraphie sans Fil is building a big wireless station at Phuto, near Saigon. The station will be started in September. It will communicate directly with the stations at Sainte Assise and Tananarise, and it is hoped will finally be able to communicate with Paris.

In Europe the same company has signed several agreements. Thus agreements were entered into with the Société Romaine Radioelectrica—which is now the Société Radioromana—with the State of Czecho-Slovakia and the Société Marpendante Belge de Télégraphie sans Fil, as well as with various foreign companies interested in the establishment of transmarine wireless communications required by the South American Republics. In Asia an agreement was signed with the High Commissariat in Syria for the construction and working of a station near Beyrout.

Another excerpt is that from the report of another of His Majesty's Commercial Secretaries, that from Stockholm, Sweden :—

In wireless telegraphy, the outstanding feature in 1921 was the examination by the Telegraph Administration of the important project for the erection in Sweden of a high-power station which, it is claimed, will be one of the largest in the world, inasmuch as it will be equipped for the transmission and reception of messages to and from the American Continent. British, French, American and German systems were examined by experts. The Swedish authorities, however, decided to suspend the placing of the order for this high-power station until the financial position improved. The site of the new station has not been definitely chosen, but it will probably be situated on the South Coast. Other wireless developments are to be traced in preliminary discussions which have taken place for the linking-up of Sweden and Finland by wireless.

As is well known the use of the telephone has reached a high state of development in Sweden. During 1921, a telephone cable was laid between Sweden and Germany, and work is rapidly proceeding with the installation of another telephone cable between Stockholm and Gothenburg, passing through Köping, Västeras, Orebro, Sköfde and Allingsas. Telephonic communication between the two principal Swedish cities is rapidly on the increase, and the completion of the cable is, therefore, anxiously awaited. Serious attention is being paid to the possibilities of the practical use of the wireless telephone.

Reference has already been made to this extremely interesting cable between Germany and Sweden, and here again one sees the rivalry of wire and wireless. The *financial position* which Sweden is waiting to see improve may be that situation, which, by closer practical experience of cable telephony with the latest improvements and highest speech values will enable her the better to compare the economic advantages of the two systems.

The Jubilee of the Eastern Telegraph Company was celebrated with due *eclat* and with feast and ceremony well worthy of the occasion. The record of this company is indeed one of which any band of enthusiastic scientists might well feel proud, owning as it does 130,000 miles of submarine cable representing a capital of £25,000,000 sterling. Those of us who were intimately connected with the cable services during the war are not likely to forget the splendid service rendered to the British Government in more than one important, not to say thrilling, enterprise during the war. The staffs of the Eastern Associated Telegraph companies anticipated the auspicious occasion by forwarding a cheque of £1,000 to St. Bartholomew's Hospital for the naming of a bed to the memory of Lady Denison-Pender.

Roland Belfort in the *Electrical Review* paid as handsome a tribute to the work of the company and to the name of Pender as one could well desire in his recent articles entitled " The Nerves of the Nation " or the Romance of the Submarine Cable.

The report of the Great Northern Telegraph Co. of Denmark to which reference was made a couple of numbers back, provides some interesting information which lack of space has, up to the present, prevented the full publication. For example, up to 1920 it was impossible to repair two or three of their submarine cables owing to the dangerous condition of the waters on account of mines. It has not even yet been possible to repair their Petrograd-Libau cable, although the Russian Government is doing its best to clear the mines from the interrupted area.

The company has also had to deal with 21 interruptions on eight of its cables in Europe, and 12 interruptions on 5 cables in the Far East. The cable steamer *H. C. Orsted* has been occupied in European waters for 253 days, of which 12 have been for the account of other administrations, whilst in the Far East the *Store Nordiske* and *Pacific* have been in commission for 191 days, including 120 days on which they were chartered by other administrations. Both the Russian Government and the company have done everything in their power to re-establish telegraphic communication between Europe and the Far East *via* Siberia. Whilst the telegraph lines through Russia and Siberia are maintained in good condition by the Russian Government, it is at present impossible to establish communication between the Russian telegraph system and the cables and landlines in the Far East either *via* Vladivostock or *via* Kiachta owing to the total interruption of both these routes. The restoration of the Vladivostock route is hindered by the state of war existing between the Governments of Tchita and Vladivostock, whilst the restoration of the Kiachta route is dependent upon the Governments of Peking and Urga succeeding in arriving at an agreement. Under these circumstances the company has had to fall back upon another scheme, which became possible of realisation thanks to the facilities granted by the Russian and Chinese Governments resulting in the establishment of a quite new route by means of a wire placed at the exclusive disposal of the company by the two administrations between Irkutsk and Peking *via* Blagowestschensk—Helampo—Harbin, and worked in connexion with the company's direct wire between Petrograd and Irkutsk. A repeater station, equipped by the company and manned by Danish operators, has in this connexion been established at Harbin. Communication was thus re-established on March 26 this year after an interruption lasting nearly four years.

The company was able to re-establish telegraph communication with Petrograd on Jan. 18, 1922. The concession which has been granted by the Russian Government binds the company to open a telegraph station at Moscow, thereby placing the Russian capital in direct telegraphic communication with the company's European cable system. Various causes have, however hitherto prevented the carrying into effect of this undertaking. The Russian terminal traffic exchanged with Western Europe and America is, so far, quite inconsiderable as compared with the corresponding traffic in pre-war times. Preliminary discussions with the Chinese Government were commenced last year by the company in conjunction with the Eastern Extension, Australasia & China Telegraph Co., with the object of obtaining a prolongation of the existing agreements between China and the two companies. Owing, however, to the decision come to by the International Conference in Washington to include the question of telegraph communication in China amongst the items for discussion there, it became necessary temporarily to suspend the companies' own negotiations in Peking pending the receipt of information as to the result of the Washington discussions. A new cable steamer, destined to replace the *Store Nordiske*, is now being built at a Danish shipyard (Nakskoy Skibsvaerft) for delivery in the course of the summer. At the invitation of the Lettish Administration a Telegraph Conference was held at Riga last September, attended by representatives from all the countries bordering on the Baltic Sea, as well as from England, Norway and the company. The principal object of the conference was to decide on the telegraph rates to be applied between the various administrations represented.

The *Financier* states that the Polish Government, as the successor of the former Russian and German Governments, has given to the Indo-European Telegraph Co. a concession for that part of its line from London to Teheran which extends from Schneidemuehl on the west *via* Thorn and Warsaw, to Rowno on the east, which is approximately the frontier point between Poland and Soviet Russia. The Soviet Government has also promised the same company a concession for that part of its line extending from Rowno (Berdiohew) to Djulfa, on the Persian frontier.

Among the best-known names, respectively of the Controlling and Superintending ranks of the C.T.O., who have recently retired from the Service, may certainly be placed those of Messrs. Fernyhough and F. W. Miles.

Digitized by Google

The former was practically compelled to stay some little while after he had actually reached the age-limit for reasons which the Controller made particularly clear to the gathering that crowded his room on the occasion of the presentation of a set of silver table ornaments to our colleague. Mr. John Lee's appreciation of the quality of the services rendered to the C.T.O. by the ex-Assistant Controller was unique in its aptness and delicate in its manner of expressing the affection of those of us who were present and who, less able to mould the fitting phrase, could only vocalise their thoughts into the words, "Dear old Ferny!"

Of Mr. F. W. Miles, it may be said that he was a cheery colleague, always ready to assist and zealous to a fault. He was born in May, 1862, and appointed on May 31, 1877, retiring practically on his birthday. As it is understood that there is a movement on foot for a wider and more practical expression of the esteem in which Mr. Miles is held it would be presumption to add more to these lines at the present juncture.

Stay! Both the above gentlemen, though reared amidst the conditions incidental to Inland as against Foreign telegraphy, have always been among those officers, at one time an almost negligible quantity, now one is pleased to acknowledge a growing number, who recognise the distinct differences between Inland and Anglo-Continental telegraph conditions, and who do their best to realise the special difficulties incidental thereto. To have gone thus far when in certain quarters the trend of official policy was at one time in a less sympathetic position is but to indicate a measure of their courage and sincerity.

Mr. Donald Murray has entered a gentle protest against the wording of a paragraph in *Memorabilia* for August regarding the utilisation of "Baudot" apparatus in New Zealand, which he thinks due credit has not been accorded the Murray inventions incorporated in the installation working between Wellington and Christchurch. It appears that phonic wheel-drive should have been included in the description.

Knowledge.—"The proper use of knowledge is in man's keeping, and it is his plain duty to use it for the benefit of mankind.

"Knowledge was never intended to be used merely as a form of mental adornment or for the external equipment of what might be called the mental fop. Much of it has been used for that purpose, and there has been too much mental snobbery in the ranks of those who should have shown to all the world that education gives to man that sweet reasonableness, balance, judgment and kindly indulgence which go to make the relationship between one man and another more nearly in accord with *the* great commandment."—*The President of Technical Teachers.*

J. J. T.

THE BAUDOT—XXXVI.

By J. J. T.

FIG. LXXXVII shows the method of connecting up a re-transmitter at an intermediate office between the two distributors A and B, representing UP and Down offices. The signals pass in from Line 1 in the usual manner *via* Rings 5 and 2 actuating the line relay R^2 which repeats, *via* Rings 4 and 1 into the Baudot receiver fitted as already described with a re-transmitter RT which we will call type one. The seven connexions shown on left hand side of RT are the five segments 1 to 5 Ring 4, the brake current lead from Ring 3, and the necessary "earth." On the right of RT the seven connexions shown are joined to a seven-point two-way switch S. The inner five are connected to the respective re-transmitting levers and the outer two serve the positive and negative power to the contact stops of the levers. The centre of the switch S is similarly joined, the five inner connexions being led to five segments of Ring 5 of distributor B, which serves the Down line. The outer two connexions are joined up direct to suitable main line voltages. This switch provides alternatively facilities for the intermediate station to speak to the Down station by means of the keyboard shown on right or for "through" working by means of the re-transmitter RT. It will be noted that the re-transmitter RT records the signals as *received* from the UP station. When the switch S, is at "through," the *outgoing* signals from RT are leaked off at R^1 by a Baudot receiver, giving control by Rings 4 and 1 of distributor B, the main portion of the current passing out to the Down station by Line 2. With switch S in reverse position the keyboard takes the position of RT.

As far back as 1909 the writer was privileged to see while still in its trial stages a remarkable mechanical development of the Baudot receiver at the Experimental and Testing Workshops of the French Government in the Boulevard Brune, Paris. The principle evolved in this particular receiver, sometimes known as the Rapid, is shown in Fig. LXXXVIII, which is all but self-explanatory. The new arrangement has also been applied to Baudot re-transmitters. In place of the brass extensions, as in

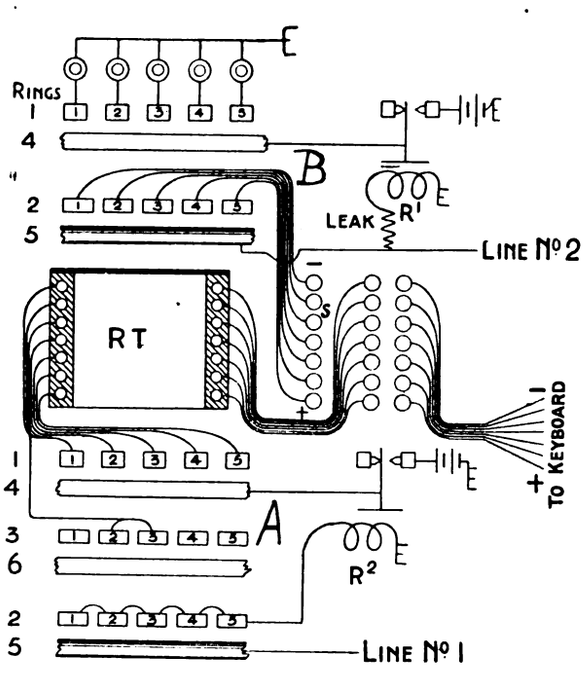

FIG. LXXXVII.

the old pattern, fitted to each of the electro-magnet armatures, which terminates with a lip, extending beyond the under-cut *a*, and protruding over the polepiece of E is an extending arm *c*, the electro-magnet E being turned completely round. When A is attracted by the passage of a current, *a* tilts down releasing a finely balanced lever *l* which partly by its own weight and partly by the impulse of the spring S falls to the left against the combiner wheel and performs the usual functions, the replacing cam of the combiner wheel restoring *l* under the extension *c* against the pressure of the spring S. The mechanical sensitiveness of this type is actually quite double that of the older model and permits of the use of distributor segments half the usual size.

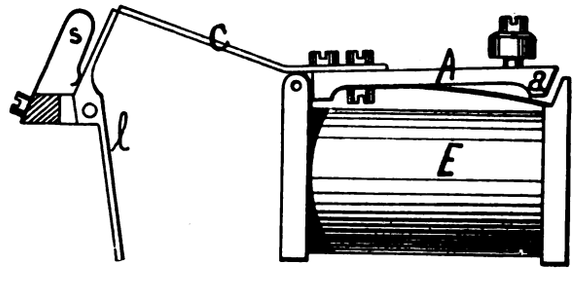

FIG. LXXXVIII.

Type two re-transmitter is known by the name of the Robichon, after its designer. There are certain disabilities attendant on re-transmitter type one, due to possible variations of the speed of

Digitized by Google

the receiver to which the re-transmitter is attached, which variations result in mutilations of the re-transmitted signals. In the Robichon the receiver is abolished. Fig. LXXXIX gives the new design: The older type of electro-magnet E, armature A and brass extension lip L are retained. Each of these electro-magnets E by means of their respective extensions L controls a re-transmitting lever consisting of two parts l, l^1, solidly fixed together but electrically insulated by an ebonite plate. All five levers are pivoted on the same axle at x. The portion l of the two-part lever terminates in a forked piece at its free end, in between which is fitted a roller cam g supported by the flat spring S. The tension of this spring is adjustable by means of two small screws T^1, T^2, together with a small double inclined plane M. The limiting piece F, forms the smaller of two prongs of the forked end of l and is locked into a slot (not shown, Fig. LXXXIX) in the spring S and limits the upward and downward movement of the roller-cam g at the axle of the latter and thus l itself. Portion l^1 of the two part lever plays between two contact stops + — to which are led the main positive and negative batteries serving the Down station.

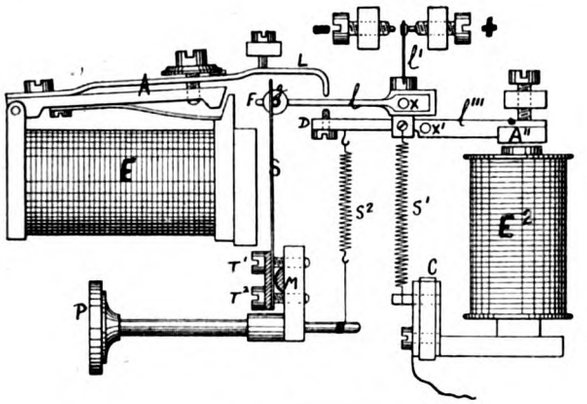

FIG. LXXXIX.

The light spring S^1 serves as an electrical connexion with the insulated metal column C, of which there are five corresponding to the number of re-transmitter levers and are severally joined with the appropriate segments of Ring 2 of the second distributor B. The action is simple. When E is energised A is attracted, the lip L strikes the lever l and a knife edge of the forked portion of l presses against the roller cam g causing the spring S to bend backwards the roller cam following, and l with it, the downward motion continues until F limits any further movement. This movement of l carries l^1 from the spacing stop, + to the marking stop —. Whatever combination of currents is received is conveyed to the respective segments of the second distributor and held there until a local current from Ring 3 of the *first* distributor energises electro-magnet E^2 which attracting A^{II} and its lever l^{III} (which latter moves on the axle x^1), throws up the reverse end of a cross-bar D, fitted with five screws, each screw being placed under one of the five re-transmitting levers. Thus, at the appropriate moment, the first distributor automatically replaces any re-transmitting lever, which may have become depressed, back into its position of rest against the spacing stop. The armature A^{II} is replaced by the pull of the spiral spring S^2, the tension being adjustable by means of the milled-edge screw P.

Type three re-transmitter, or the 1909 model, adopts the action of the receiver described in Fig. LXXXVIII. Fig. XC shows that the lettering A, a, C, and l correspond. A spring lever S plays between the spacing and marking stops, + and —. The lever l forms a solid though insulated part of S which itself is insulated by means of a small ebonite base-plate, but maintains electrical connexion with the second distributor by means of an eyeletted spiral spring S^1 hooked at the ends H,H^1. An insulated column C^1 forms the exterior connexion. When E is energised the end a of A is attracted and throwing C upwards ceases to support the lever l which now gives way to the pull of the spiral spring S^1 causing S to move from the spacing to the marking stop. The replacement of the various displaced levers of each re-transmitter in this as in the Robichon is by means of a second electro-magnet E^1 common in

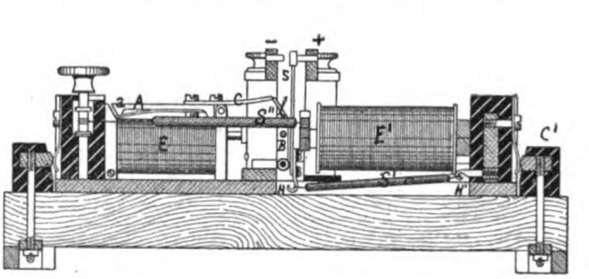

FIG. XC.

action to all five re-transmitter levers. In this case the attraction of the armature E^1 draws with it a rod B placed on the left-hand side of the levers. The movement of B *collects* all levers thrown on to the marking contacts and replaces them against the spacing contacts ready for the next series.

With re-transmitter type one, the re-transmission of the received signals happens exactly at the end of an entire revolution of the brushes. With types two and three the received signals are practically *stored* immediately on receipt and are re-transmitted generally at the termination of half a brush revolution. The exact moment will of course depend upon the necessities of the special case.

Finis.

ROCHDALE TELEPHONE DISTRICT.

An interesting Cricket Match was played between the Engineering Office staffs and the District Manager's staffs on July 13, 1922. The Engineers, captained by the Sectional Engineer, Mr. Best, proved too strong for the District Manager's team, led by Mr. Whitelaw, District Manager, the former gaining an easy victory. The exchange and out-door staffs later defeated a combined team of the Engineering and District Manager's people.

The outcome of these encounters resulted in an invitation being extended by the Rochdale Telephone District to the Halifax Telephone staffs to visit Rochdale and play a match on August Bank Holiday, but the treacherous weather prevented the game from taking place. Efforts will be made to play the game at a later date.

RETIREMENT OF MISS SADLER, O.B.E.

(Superintendent of the Women's Staff, Accountant-General's Department, G.P.O.).

An interesting reception was held by the senior women of the Accountant-General's Department, General Post Office, on Friday, Aug. 18, on the occasion of the retirement of Miss Sadler, O.B.E., Superintendent of the Women's Staff, after 41 years' service. A large proportion of the staff attended. Amongst the visitors present were: Miss Loch, the recently appointed Woman Establishment Officer, G.P.O., Dr. Madgshon, Principal Woman Medical Officer, G.P.O., Sir Henry Bunbury, K.C.B., Comptroller and Accountant-General, Mr. Harrington, Deputy Comptroller and Accountant-General, Mr. Slater, Controller of the Money Order Department, &c., &c.

Miss Barrett, Senior Deputy Superintendent and Miss Boyd, on behalf of the staff, spoke in eloquent terms of Miss Sadler's work, after which Sir Henry Bunbury made the presentation—a gramophone and cabinet of records, also a moonstone pendant. In the course of Sir Henry's speech, he said "Miss Sadler was one of the first women associated with the development of the women's work in the Accountant-General's Department and she had not only seen history, but had made it. When she joined the Accountant-General's Department the women numbered 78, when she became Superintendent in 1907 they had reached 323, while to-day they are not far short of 1,000." In reply, Miss Sadler expressed her thanks for the gifts and good wishes and gave a brief sketch of the progress made by the women since her early days, in the direction of increased responsibility and variety of work.

Miss Webster, Deputy Superintendent, passed a vote of thanks to the visitors and Mr. Harrington replied. The proceedings then terminated with the singing of "Auld Lang Syne."

The
Telegraph and Telephone Journal.

PUBLISHED MONTHLY IN THE INTERESTS OF THE TELEGRAPH AND TELEPHONE SERVICE, UNDER THE PATRONAGE OF THE POSTMASTER-GENERAL.

Editing and Organising Committee - - - J. STUART JONES. JOHN LEE. J. J. TYRRELL. W. A. VALENTINE. J. W. WISSENDEN.

Managing Editor - - W. H. GUNSTON.

NOTICES.

As the object of the JOURNAL is the interchange of information on all subjects affecting the Telegraph and Telephone Service, the Managing Editor will be glad to consider contributions, and all communications together with photographs, diagrams, or other illustrations, should be addressed to him at G.P.O. North, London, E.C.1. The Managing Editor will not be responsible for any manuscripts which he finds himself unable to use, but he will take the utmost care to return such manuscripts as promptly as possible. Photographs illustrating accepted articles will be returned if desired.

VOL. VIII. SEPTEMBER, 1922. No. 90.

A LIGHT—AND LEADING—ARTICLE.

IN the holiday season we turn gladly to lighter themes than those which occupy our more strenuous hours, and amongst others which may claim a vagrant attention is the fascinating one of ready-made humour. The vigorous and creative mind has a proper contempt for anything ready-made and the artistic conscience is revolted by it, but yet, we repeat, there is something fascinating, something in tune with the holiday mood in anything effortless or ready to hand, such, for instance, as an easy variation on a well-worn jest or in the reiteration of a well-known gibe.

You think of the Civil Servant. You add many imaginary failings, deduct all his good works, then take away the Civil Servant you first thought of and you find that he is like the fountains in Trafalgar Square and plays from 10 till 4. You murmur the words "Tite Barnacle" and the "Circumlocution Office," and they work like a charm. You have your theme and can develop it, decorated with these borrowed plumes, for half a column or more, and your readers, if any, will never grow restive. They, it may be, hate to be bothered with new ideas, and then there is something soothing in the repetition of the friendly, familiar joke. What the Civil Servant was in 1820 he is, of course, or at least ought to be, in 1920. Or, sounding a sterner note you can raise the bogey of State Socialism and do a good turn for the Individualist at a small cost of thought. There is a note of modernity in the touch and it will give you a hearing in those powerful sheets which interestingly endeavour to combine democratic with capitalistic ideals.

The telephone is so inexhaustible a theme that every humorist may draw from this well and go away refreshed. The mere mention of this indispensable and much misunderstood device calls up facile jests on the subject of wrong numbers and operators reading and knitting jumpers. The comic press of the whole world delights in the theme, which they treasure more than the mother-in-law, the inebriate, or the *enfant terrible*. During the last three or four years we should say that *Punch* has had a telephone joke in almost every number and almost all to the same effect. Is it propaganda work in the interest of the long-suffering subscriber, or is it that the humorist is taking the line of least resistance? *Punch's* prototype on his tiny stage always favoured the humour of the stick. Cudgelling his wife or the beadle and throwing the baby out of the window are unsophisticated, simple forms of humour, which have a wide appeal, and possibly *Mr. Punch's* humorist is only carrying on the unsophisticated tradition. The dawdling telegraph boy is not to be despised as a subject for witticism, nor the letter which takes 5 or 6 years to get itself delivered. The latter is unfortunately so rare and forms such an infinitesimal proportion of the letters correctly delivered that it cannot often be utilised, and it would be interesting to hazard a guess at the proportion of actual cases to paragraphs on the subject.

What of the effect of scolding and sarcasm and even wilful misunderstanding on Civil Servants? Do they encourage and inspire them, the telephonists especially, to give of their best in their arduous daily task. Well, well; we are not a thin-skinned section of society and, moreover, though we whisper it with bated breath, we have a horrid suspicion that these humorous efforts and portentous paragraphs are neither of them always read by those whom they are meant, as we may charitably suppose, to "ginger up." The Civil Service goes on, and we may say of the services of which we have personal knowledge: *eppur si muove*. The Civil Servant plays from 9 till 4 or 10 till 5 and longer, but he usually plays the game. The telegraph and telephone systems expand and improve, new exchanges are opened, new trunk lines are provided, new improvements are adopted. Pre-war conditions were resumed far sooner than they were on the great railway systems, for instance, and certainly at a smaller increased cost to the public.

Far-reaching schemes of development and reconstruction are in hand, which have been inaugurated and will be carried out by Civil Servants with a zeal and thoroughness which are really the cream of the whole ponderous jest. At least, we leave it to such of our readers on vacation as love holiday problems to discover if there be any other latent humour in the theme which has escaped us.

HIC ET UBIQUE.

As our readers will have learned from the daily press, telephonic communication was opened with one circuit between London, The Hague, Rotterdam, and Amsterdam, on Aug. 15. When the other circuits are ready communication will be extended to other towns in both England and the Netherlands. On Aug. 11 a direct line was opened from London to Paris Plage, chiefly for the benefit of English visitors to the French coast resorts.

Digitized by Google

WE propose next month to begin a series of articles on the elementary principles of telephony which we think will be both useful and interesting to our non-technical readers. They will be written by Mr. A. Crotch, of the Engineer-in-Chief's Office, and will be well illustrated by explanatory diagrams.

MR. V. M. BERTHOLD, official statistician of the American Telephone & Telegraph Co., has kindly sent us an interesting bulletin of statistics of South and Central America as at Jan. 1, 1921. At that date there were 116,553 telephones in the Argentine, 85,091 in Brazil, 44,784 in Mexico, 34,376 in Cuba, 29,867 in Chili, and 22,381 in Uruguay. Buenos Aires had 65,387 telephones, Rio de Janeiro 30,522, Habana 24,936, Mexico City 23,503, and Monte Video 13,420.

A PROVINCIAL subscriber complained that he did not get good service. On being informed that his telephone had been tested and found to be in good working order, he sent the following instructive advice :—

I am obliged by your letter. There should be no trouble in getting in touch with the exchange seeing that it is not much above 300 yards distant. The fault is not the *personal* service, but it is probably due to atmospheric, mechanical and structural defects. I have reason to suspect that the salinity of the air, due to proximity to the sea, affects the contacts on the switchboard. Might I suggest a hygrometric test to be made on the subject.

A drying tube containing chloride of calcium or pumice saturated with sulphuric acid will give you the desired information, or apply a condensation hygrometer, or a Daniell's hygrometer or a psythrometer. You will then be able to determine the Glasbiers factors. These tests will be far more efficacious than my standing for half-an-hour in bare feet on cold linoleum trying to prevent a man taking extreme action due to grief and damning everything and everybody generally. You have a go at it and then have a go at—

Yours sincerely.

WITH reference to the "Extracts from Letters Home of a Young Telephone Engineer sent out to India to Instal the First Automatic Switchboard" appearing in these columns, the Automatic Telephone Manufacturing Co., of Liverpool, write pointing out that considerable progress in automatics has already been made in India. They say :—

As far back as 1913 this company installed the first public Automatic Telephone Exchange at Simla and it then consisted initially of 800 lines with an ultimate capacity of 2,000 lines. Since then there have been seven extensions to this exchange, and the present capacity now totals 2,100 lines.

Lahore also boasts an Automatic Exchange of 700 lines which has been working for four years, whilst Amritzar has had a 400-line exchange in operation for upwards of two years.

We do not think it is necessary to refer to any further exchanges of a private character to make it clear that India is much more advanced in Automatic Telephone facilities than your correspondent and possibly some of your readers are aware.

We may further add that we shall shortly be commencing the manufacture of equipment for two Automatic Telephone Exchanges in Bombay, totalling 11,000 lines—a further indication of the enlightened policy of India's Telephone Administrations.

ACCORDING to the *Daily Chronicle* "there are 16 telephone sub-stations in Tokyo with 7,000 moshi-moshi girls or operators." If our contemporary's rendering of moshi-moshi be correct, this would mean that there is in Tokio about one operator to every 7 subscribers, which approximates the ideal of that sort of subscriber known to all telephone administrations who thinks he ought to have an operator to attend to his exclusive wants.

NORTH WALSHAM TELEGRAPH REPEATER STATION (NWV).

BY A. C. BOOTH.

(Reprinted by the courtesy of the *Post Office Electrical Engineers' Journal*).

THE Repeater Station at this small country town in the north-east portion of Norfolk was established in 1891 for use in connexion with the 4-wire submarine telegraph cable laid during that year between Bacton and Borkum. Bacton is a small village on the Norfolk coast, some five miles distant from North Walsham, and Borkum is an island on the other side of the North Sea off the coast of Germany.

The cable was connected by open aerial lines from Bacton to the repeaters at North Walsham, whilst on the other side the cable was extended across the island of Borkum, a distance of some 3 miles, across the 20-mile section of shallow water to the mainland at Greetseil, and on to the town of Emden, about 13 miles, where the repeaters for the continental side are situated. The extension was made by the same type of cable as that across the North Sea, viz., 107 lbs. copper and 150 lbs. G.P., and is taken direct to the Emden Telegraph Office. At the cable huts the wires are not passed through

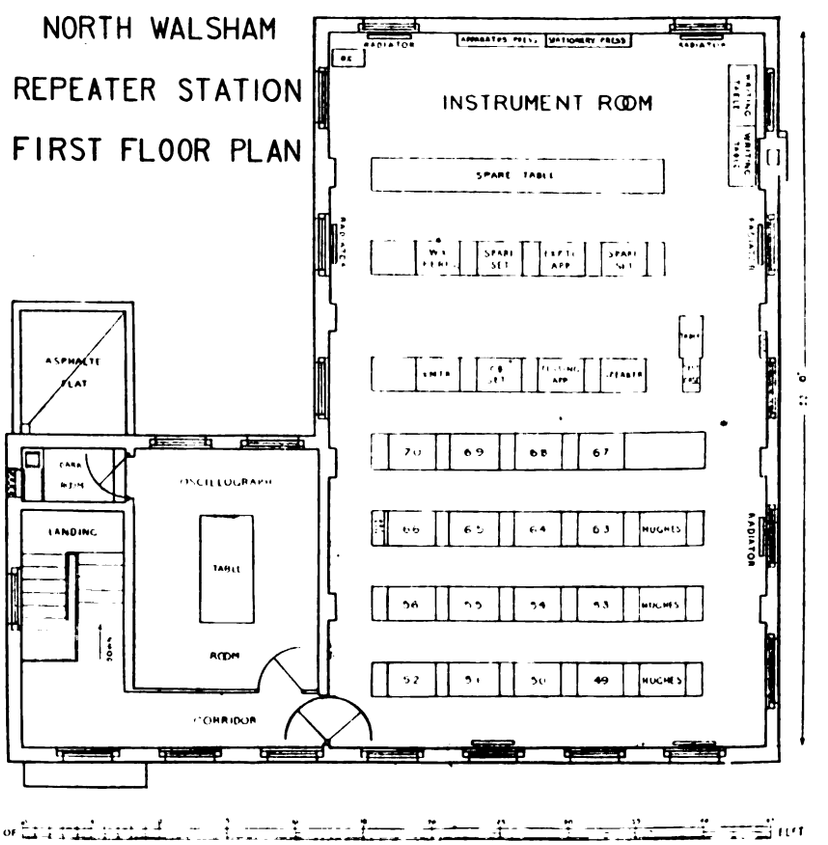

FIG. 1.—PLAN OF INSTRUMENT ROOM FLOOR.

connectors, because of the loss of insulation that would result in this rather exposed and damp locality, but are directly connected and insulated with gutta-percha in an exactly similar manner to an ordinary cable joint. It follows therefore that the cable is practically Bacton to Emden.

This first cable from Bacton formed the third 4-wire direct cable to Germany. The other two 4-wire cables were laid many years previously from Lowestoft.

In 1896 a second 4-wire cable was laid from Bacton to Borkum and extended in a similar way to Emden by submarine type of cable and to North Walsham by aerial line. The additional cable resulted in an increase

Digitized by Google

of repeaters from 4 to 8, all of which were of the type known as Simplex Hughes Repeaters, providing for the repetition of the single-current impulses that actuate the Hughes printing telegraph instrument. The office at North Walsham was not large enough to accommodate the additional apparatus and batteries required and had to be increased in size and considerably altered in consequence.

In 1897, Mr. John Chapman, of the Engineer-in-Chief's office, commenced the duplexing of these circuits to meet the rapidly increasing telegraph traffic between England and Germany. Even with this improvement in the carrying capacity of the cables a further increase soon became necessary.

In 1901 a third 4-wire cable was laid between Bacton and Borkum and was extended in a similar way to the other two. This addition necessitated a second enlargement of the North Walsham Station, and the opportunity was taken to replace the Bichromate batteries, then numbering some 1,000 cells, by secondary cells charged by a dynamo driven by a gas-engine.

The increased carrying capacity provided by the laying of this third cable, which was also worked duplex on all four wires, had by 1912 become insufficient to carry the ever-growing traffic.

In 1913 a fourth 4-wire cable was laid, but in this case from Mundesley, a small village 2 miles north-west of Bacton on the English side, to Norderney, an island situated some 40 miles east of Borkum on the German side. The extension to North Walsham was again made by aerial line and to Emden by cable, as in the other cases.

During 1914 the aerial routes from North Walsham to Bacton and Mundesley were replaced by an underground paper-insulated cable to avoid the variation of insulation and other troubles incidental to aerial lines, which adversely affected the Duplex balances.

With the provision of the fourth cable the congestion in the North Walsham office necessitated the installation of two repeaters in a separate room. This was not a convenient arrangement, and as the additional demand for current was approaching the limit of the charging equipment it was decided in 1913 to seek for, or build, more suitable accommodation. The old building had not been intended for housing such a number of repeaters; whilst its successive enlargements, although giving the required space, were not altogether satisfactory.

As no other suitable building was available in the neighbourhood, ground was purchased and plans prepared for the erection of a building that would accommodate the 16 working repeaters and in addition would provide for an increase of 12 more without any structural alterations; the ground space obtained was of sufficient size to permit the building being extended to double the size of the new office whenever that requirement became necessary. The work was about to be commenced when the war postponed any further action. The old office was dismantled and the repeaters were sent to other parts of the country; later on, several of them were sent to France.

On the resumption of telegraphic communication with Germany, in 1919, the old office was re-opened and the repeaters re-installed. As soon as conditions permitted, the erection of the new office was commenced, but progress was slow and the building was not completed until the autumn of 1921, enabling the working circuits to be transferred at the week-end in the following December.

A plan of the instrument room, which is situated on the upper floor of the new office is shown in Fig. 1, with the positions of the repeaters numbered according to the land lines they serve.

Strictly speaking, the repeaters are proper to the cable circuits, rather than to the land lines, as the latter are changed to meet requirements, whereas the cables are not changed unless a fault occurs in the repeater, thus rendering a change necessary. There is also another and very important reason why the cables should not be changed and that is due to the presence of the "Anti-induction Condensers," which are connected between the four conductors of any one cable. These condensers serve to neutralise the greater portion, about 60 per cent., of the inductive disturbance from neighbouring conductors. The length of these Anglo-German cables approximates to 300 miles, and as there are four wires in each cable it follows that each wire is disturbed by the combined effect of the other three. The disturbance is so great that in effect it reduces the working speed by about 50 per cent. The use of the anti-induction condensers enables a greater effective speed to be obtained. The crossing of a cable circuit to another repeater involves also the crossing of the 4 wires of the anti-induction arrangement; otherwise the disturbance is not only not neutralised but additional disturbance is brought into all four circuits and the balances are also disturbed.

A schedule of the cable circuits with the lines and apparatus in use is given below :—

ANGLO-GERMAN CABLES (*via* NORTH WALSHAM).

Bacton—Borkum 1.

No. of English Land Line.	No. of Cable Wire.	Towns served.	Apparatus used.
49	9	London—Bremen	Hughes Simplex or Duplex
50	10	„ —Emden	„ „ „
51	11	„ —Dusseldorf	„ „ „
52	12	Interrupted	„ „ „
		Bacton—Borkum 2.	
53	13	Interrupted	Baudot Double Duplex
54	14	London—Berlin	Siemens Duplex
55	15	„ „	„ „
56	16	„ „	Baudot Double Duplex
		Bacton—Borkum 3.	
63	17	London—Frankfort	Hughes Simplex or Duplex
64	18	„ —Cologne	„ „ „
65	19	„ —Leipzig	„ „ „
66	20	„ —Prague	„ „ „
		Mundesley—Norderney.	
67	21	London—Hamburg	Baudot Double Duplex
68	22	„ „	„ „ „
69	23	„ „	„ „ „
70	24	„ —Berlin	„ „ „

Two of the cable circuits happen for the moment to be interrupted, but are expected to be repaired during this summer. The Vienna circuit has not been restored, nor are the two circuits which Liverpool worked to Hamburg and Bremen respectively.

It will be seen from the plan that each cable is arranged to accommodate the four circuits of one cable with space at one end for a Hughes instrument to check the passing signals when required. As, however, the tendency is to replace the Hughes instrument by apparatus giving a much larger output, such as the Baudot Duplex or Siemens, this space may be liberated in the near future to be occupied by additional apparatus required for increasing the working speed of the cables, such as relays of the Gulstad type with their additional condensers.

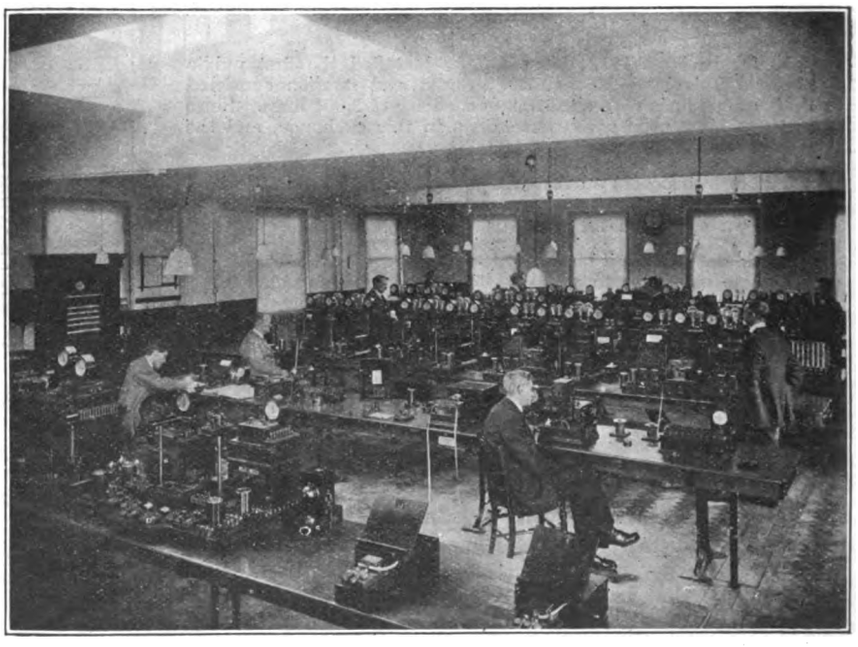

FIG. 2.—INSTRUMENT ROOM.

Digitized by Google

It will be noticed that there is a separate room for Oscillograph purposes, with a smaller room for photographic work.

It is expected that telegraph traffic with Germany will increase in the course of a few years and that there will be need for further additional facilities. Possibly the loop method of working, with its freedom from inductive disturbance, may provide better output results. This method was under trial with Germany at week-ends in 1914, at the suggestion of the British Post Office, but was not completed before war put a stop to any further work. It is possible that the trial may be resumed later.

Fig. 2 gives a view of the interior of the instrument room, showing in the left foreground two spare repeaters, and on the next table a syphon recorder in use for experimental purposes. On the third table can be seen the four repeaters of the Mundesley cable.

The following tables give the full details of the submarine cables :—

DETAILS OF SUBMARINE TELEGRAPH CABLES BETWEEN NORTH WALSHAM AND EMDEN.

	Bacton—Emden.			Mundesley—Emden.
	I.	II.	III.	
Date laid	1891	1896	1901	1913

Back row :—C. F. Wilson, H. C. Whybrow, W. H. Nobbs, W. H. Mortimore, E. Missen, J. Mansford, E. Annible.

Front row :—J. Lockhart, S. Farrow, E. Lack, M.B.E., T. T. Parker, R. P. Smith.

Fig. 3 shows the staff at the station and includes two from the Engineer-in-Chief's office, Messrs Lack and Lockhart, who were carrying out experimental work on the cables during the week-end on which the photograph was taken.

LONDON ENGINEERING DISTRICT NOTES.

Knowledge is Power.

ONE of the activities of the Institution of Post Office Engineers is to arrange for visits of its members to manufacturers' works and other places of technical interest. It is not always necessary, however, to go beyond the boundaries of the Department to find a suitable field for widening the knowledge of the majority of the members in matters affecting their daily activities. The Department has long recognised the need for a specially-trained staff of engineers to give their whole time to scientific investigation in connexion with the business of electrical communications. Hitherto the men engaged on research work in the Post Office have been handicapped by inadequate accommodation. With the growth of the business the necessity for more commodious quarters became very evident, and it was decided to erect a special building for the purpose. Dollis Hill was selected as a suitable position, but owing to the financial stringency, the permanent building has had to be deferred and in order to enable the good work to be carried on a cluster of army huts has been erected and equipped as a temporary measure.

It was for the purpose of inspecting the Research Section in their new quarters and to learn something about the way in which this very important branch of the Engineering Department's activities is being conducted, that some of the London members of the Institution visited Dollis Hill last month. The block includes the necessary offices and a series of buildings, each equipped for some particular branch of research work. In addition to laboratories reserved for transmission studies, measurements, and tests, is a chemical laboratory, a metallurgical laboratory, a photographic laboratory, and a fully equipped workshop, which contains some very fine precision tools. Space will not permit of a description of the many interesting appliances in use. The visitors were very much impressed by the admirable facilities now available for research. Under the far-seeing direction of the Staff Engineer, Mr. Pollock, great progress in this branch of the Engineering Department's work is certain.

On the same site is the Engineer-in-Chief's Wireless laboratory, with transmitting and receiving aerials, and this proved a great attraction, particularly to those who have experimental stations of their own.

Telephone Cables.

How many of those idle lookers-on who always foregather to watch any operations in the streets of a City where the labour of others is involved, realise what is contained within the lead sheath that they see being slowly transferred from a drum to the bowels of the earth. If it is an electric light or power cable the hidden portion is not much to wonder at, but if it happens to be, say, a 1,000-pair telephone cable, each wire weighing 6½ lbs. per mile, then the looker-on, if he understood, might well marvel. Individual wires to the number of 2,000, each wrapped with insulated paper and a distinguishing thread, and the whole contained within a lead covering with an external diameter of 2.62 inches ! The thickness of the sheath itself is .134 inches, so that the diameter of the stranded wires is only 2.35 inches, about the size of the average person's wrist. Even the 800-pair 10 lb. conductor cable does not exceed 2¾ inches diameter. The smaller gauge wire, viz., 6½ lb. has a maximum diameter of .0205 inches and a maximum resistance of 135 ohms per mile. It will readily be realised what a delicate operation the jointing together of two lengths of such cable is. The finished joint must fit into a sleeve of 4 inches external diameter. The operation would be no easy task if carried out on a bench in good light, but actually the work has to be done in a jointing chamber where space is often very restricted, and where it is difficult to arrange for light to be directed upon the joint.

Telephone cable jointers acquire from long practice that nimbleness of fingers usually attributed to women. When the joint has been completed and the sleeve placed in position, there is still another highly important operation to perform. This is the sealing of the joint by plumbing the sleeve at each end to the cable sheath without damaging the delicate contents. Before the introduction of the Torch Blowlamp, plumbing was carried out with the aid of a Plumber's stick which consisted of a rod with an egg-shaped knob at the end. The knob was heated in a fire and then used to melt and mould the plumber's metal. A plumber's wipe on a cable can be made under favourable conditions without the aid of a torch, but the conditions in manholes are rarely favourable. In the case of a multiple joint the torch is a *sine qua non*, as without it, it is impossible to work the metal in between the forks at the junction of the branches. The soundness of a plumber's wipe is tested by passing air into the joint under pressure and observing whether any bubbles are formed in a film of soap suds which is spread over it. Defective plumbing, if left, may not give rise to trouble for a considerable time ; perhaps not until exceptionally heavy rains cause flooding of the manhole— then the result may be disastrous. Fortunately, trouble due to such a cause is rare, and this can be attributed to the pride the jointing staff take in their work.

If any readers are sufficiently interested and wish to see some splendid examples of the plumber jointer's craft, they should inspect the joints between the external cables and the main frame cables in some of the recently built exchanges.

Arterial Roads.

Under the Development and Road Improvement Act, 1909, the Ministry of Transport (as successors to the Road Board) is empowered, with the approval of the Treasury, to

(*a*) Make advances to local authorities towards the construction and maintenance of new roads and improvements to existing roads, and

(*b*) to construct and maintain new roads.

Since the termination of the War the Ministry has approved a large number of schemes for new arterial roads, by pass roads, widenings of existing roads, &c., in and around the Metropolis, and in many cases the work has been commenced.

As will readily be understood operations of this nature involve at an early stage the consideration of the Post Office engineering staff as regards both the alterations necessary to the existing telegraph plant and the possibility of using the new roads for development and new routes.

Whilst many comparatively minor widenings involving in some cases considerable alterations to both overhead and underground plant have already been carried out, the progress of the construction of the arterial roads has not yet greatly affected the telegraph and telephone services. The sections of these arterial roads now under construction are mostly in semi-rural areas, and, while the utility of such a road for main line purposes is easily settled, the problem of providing for local telephone development is somewhat difficult. It is probable that the frontages of these main roads will be taken up by important business premises, whilst the property in the rear may develop on the dormitory lines so well known to Londoners.

In each case the opportunity is being taken to place sufficient underground plant along the route of the new arterial road to provide for development for an extended period of years in order to prevent disturbance to the carriageway and footway surfaces as much as possible. In this connexion, it may be mentioned that in the case of the Great West Road subways are being constructed at each of the important road crossings to contain not only the telegraphs, but the services of other undertakers, such as water, gas, electricity, &c.

Buried London.

In the February number reference was made in these notes to the finding of some Roman remains in Gracechurch Street during trenching operations in connexion with the provision of plant for the new telephone exchange in Great Tower Street. On July 25 an article appeared in the *Daily Telegraph* by the eminent archæologist, Walter E. Bell. No one knows more about old London than Mr. Bell, and the burrowing propensities of the P.O. have from time to time disclosed remnants of "Londinium" which have assisted Mr. Bell in giving us a mental picture of the City through whose streets the Roman Conquerors strutted, and which formed such a contrast to the rude dwelling places of the indigenous and barbarian British. Mr. Bell examined the remains referred to above and suggests that the painted plaster was a device to assist the owner to recall the marble glories of his native "Eternal City." Londoners who are proud of their City but who are notoriously ignorant of its historic treasures, owe a debt of gratitude to Mr. Bell for his several books in which he unfolds in such pleasing style the past and tells his readers where the historic remains can be found and all about them. Comparatively few Roman remains have been found South of the Thames, but quite an interesting collection was unearthed during the excavations made in 1913 for the foundation of the present H.Q. Offices of the London Engineering District.

Safety First.

In view of the large number of motor vehicles now in use by the Department, and the consequent necessity for storing petroleum spirit for use with the vehicles, it is interesting to note that the British Fire Prevention Committee favour the use of sawdust as a means of smothering the fire in the event of the petrol becoming ignited. The sawdust will float for some time on the liquid thus excluding the oxygen of the air and smothering the fire. Some advantage accrues by adding bi-carbonate of soda to the sawdust, as under the action of heat carbonic acid gas is formed, which slightly assists in extinguishing the fire. The mixture to be thoroughly effective must be applied not only in bulk, but rapidly and systematically, the object being to produce what may be termed a "lateral curtain" effect.

Removal.

Mr. P. T. Wood and the office staff of the Centre Internal Section, have now taken up their quarters at 39, Charing Cross Road. This building was purchased by the Post Office before the war. During the war and since the Armistice it has been in the possession of the Admiralty Hydrographic Department, who still occupy the lower portion, which, when vacated by them, will be converted into a P.O. Fitting Office Stores and linemen's centre.

The present offices at 15, Gerrard Street will then be given up.

Obituary.

It is with regret we have to record the death at the early age of 51, of Mr. P. A. Roberts, Assistant Engineer, which occurred on July 26. Mr. Roberts had been associated with the West External Section of the London Engineering District since 1907, and for many years he had the supervision of the Maintenance Staff of that Section.

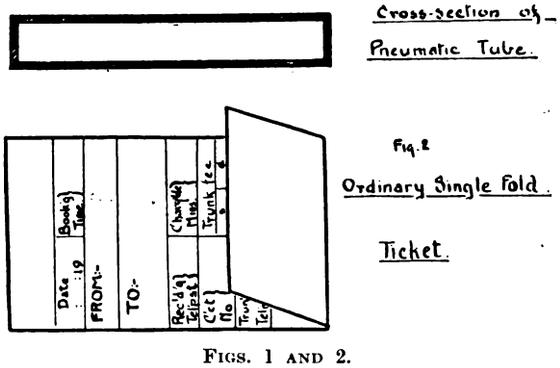
Since a serious illness in 1913, Mr. Roberts had not enjoyed the best of health, but in spite of an ever present weakness he always maintained a cheerful disposition and lost no opportunity of contributing to the welfare of others. With such a disposition he was naturally on very friendly terms with the staff, and the news of his death caused quite a gloom throughout the Section. The funeral took place at the West Norwood Crematorium, on July 31, and was attended by a number of his colleagues in London. A large and beautiful wreath from the staff in the Section and from colleagues in the district was the symbol of affection in which the deceased was held.

Earlier in his career Mr. Roberts was a telegraphist at the C.T.O., and later a Sub-Engineer in the London District. For some years he was a member of the Civil Service Orchestra, and also a member of 24th Middlesex Regiment (now P.O. Rifles).

He leaves two daughters, aged 12 and 13 respectively, and as these are now motherless as well as fatherless, very much sympathy is felt towards them, as well as for the aged mother, and the brother and sister left behind.

THE LONDON TRUNK EXCHANGE.

THE NEW RECORD TABLES.



BY J. W. G. KENNEDY.

THE work of building new Record tables in a room on the first floor of the G.P.O. (South) building is now in progress. Since the opening of the Trunk Exchange the Record tables have always formed part of the equipment of the exchange itself, and their removal from the switchroom, the steps which have preceded it, and the factors which make the removal possible, form a new departure in this work which is not without interest.

In order to allow even those who do not understand the present system to appreciate the change, I will briefly explain the sequence of operations in the recording and completing of a Trunk call, of which the work of the Record Table forms an important part.

When a local subscriber calls for "Trunks" he is connected by the telephonist in the local exchange with an outgoing line to the Trunk Exchange. The lines from the exchanges are connected at the Trunk Exchange to the "Record Distribution" positions, where the call from the local exchange causes a signal lamp to glow. The Trunk Record positions are also connected with the Record Distribution positions, each Record position being represented by a plug and cord at a Distribution position. The work of the Distribution telephonist is merely to connect the plug representing a disengaged Record telephonist with the connecting jack corresponding with the lamp signal on which she receives a call.

The Record telephonist, whose circuit has been connected, receives a call on a lamp signal associated with her position, "throws" her speaking key to answer and is immediately in touch with the calling subscriber. Having prepared a ticket with particulars of the subscriber's exchange and number and the exchange and number of the subscriber required, together with the booking-time of the call, the ticket is placed in an opening, the cover of which is raised to allow of this, and despatched to the Ticket Distribution Centre by means of a special form of pneumatic tube (of which I shall have more

FIGS. 1 AND 2.

to say). From this centre it is sent through one of a series of tubes of the same type as the Record table tube, which connect this centre with each Trunk position in the exchange. Arrived at the Trunk position where the call will be controlled and completed, the ticket is placed in booking-time order in the rack allocated to waiting work, and finally completed by way of a Trunk line on the one side, and one of the Trunk outgoing junctions to the calling exchange on the other.

The most important factor in the distribution is the pneumatic tube system. Prior to the existence of the present system a revolving band was

Digitized by Google

in use at the Record table, which carried the tickets from the Record telephonists to the Distribution centre, and at this point they were sorted into a series of pigeon-holes and circulated by hand to the various positions.

No statistics are available, but with the old system of belt and hand circulation, many minutes must have elapsed from the time the Record telephonist placed the ticket on the belt until it reached the position. With the present system it is not unusual where there is no delay at the positions for a call to be completed within one minute of the time booked by the Record telephonist. The actual tube times from the Records to the Distribution centre and from the centre to the position average 3 seconds in the first case, and 6 seconds in the second.

The main feature of the pneumatic tubes used is that no carriers are necessary.

The tube is of oblong cross-section, and in lieu of a carrier, one end of the ticket is folded back to form a "sail." A sketch of the form of ticket used and a side elevation showing a ticket in the tube is shown in Figs. 2 and 3.

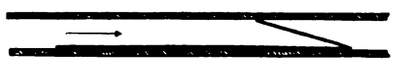


Fig 3
Side Elevation showing Ticket in Tube.

It has always been realised that a busy Trunk Exchange where the telephonists' work is continually affected by transmission difficulties is not the right place for a Record table owing to the additional noise of the Record operating, but the prime necessity of having the ticket prepared where it can quickly be transmitted to the operating positions has always previously outweighed other considerations in fixing the location of the Record work.

It will be realised that the form of pneumatic tube explained here, is subject to very delicate adjustment. With an ordinary pneumatic tube in which carriers are used, no difficulty of adjustment exists, but with the present form of tube where the motive power must be adjusted to work with the flap of the ticket as a "sail," the margin of adjustment is very fine.

When the suggestion for removing the Record tables out of the Trunk Exchange was made it was doubtful whether the present form of tube could be made to work from the first floor to the third floor, a distance of 50, and a lift of over 30 feet. The Western Electric Company could not guarantee that the tube would work under such conditions, no tube of this form having previously been tried with so great a lift or in which so many bends were necessary. An experiment was, however, carried out.

The first trials were somewhat favourable, but damp weather, which has always made the working of these tubes difficult, caused stoppage, and the whole experiment was for a time regarded as inconclusive.

A method of clearing a tube of this type which is blocked by only one or two tickets is to fasten two tickets back to back thus providing a ticket with a "sail" on each side, and this is often effective when the passing of another ticket would only add to the blockage. Based on this idea a modification of the form of ticket was suggested which consisted of pasting another piece of paper at the back of the ticket to form a second "sail."

The effect of the additional "sail" making what was called the arrow-head ticket was at once evident in the acceleration of the speed of travel and in the elimination of stoppages.

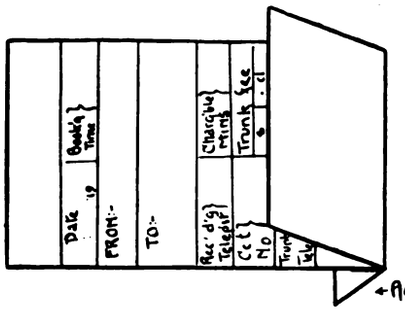

Fig 4
Arrowhead Ticket.

The/

The above side elevation shows an arrow-head ticket in the tube, the additional power would seem to be obtained partly by the provision of a better resistance to the air force, but more by the eliminating of resistance caused by the form of the ticket. It will be seen that with the single fold ticket the whole of the length of the ticket lies flat on the bottom of the tube, whereas with the arrow-head ticket only the edge of the bottom "sail" and the extreme edge of the ticket touches the bottom. Although the arrow-head was a distinct improvement it had very great disadvantages, the additional sail was found to be inconvenient in use and liable to become detached. The experiment was still inconclusive. At this point a suggestion was made that an experiment should be tried with the original ticket by giving it an additional fold which would have the effect of providing a sail on each side without the expedient of affixing an additional piece of paper to the ordinary ticket.

This simple expedient was at once found to be an improvement on anything which had preceded it. It was quicker than the ordinary and quicker and more certain even than the arrow-head ticket and was free from many of its disadvantages.

I have said that the adjustment of the tubes under ordinary conditions was a delicate one, and that they were affected by damp weather. For this reason a special quality of very expensive porcelain paper was in use on account of its being almost impervious to moisture, and an electrical oven had also to be installed to remove the moisture out of the tickets before use.

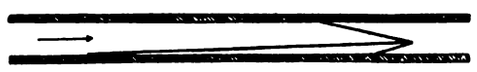

Fig 5
Arrowhead Ticket in the Tube.

Mr. H. P. Brown, who suggested the use of the arrow-head ticket, claimed that with the additional impetus given to the ticket by the extra sail, a less expensive quality of paper could be used and as a matter of fact the arrow-head tickets with which the experiments were made were of relatively cheap paper. The same advantage is found in the use of the double-fold ticket, and it is evident that a considerable saving will be made in the cost of the paper used for tickets by the use of the double-fold ticket.

The new Record tables are expected to be completed in about three months. The removal of the Record tables will not only allow of better conditions for long-distance Trunk working, but will allow of the important work of recording the calls being carried on in a relatively quiet room.

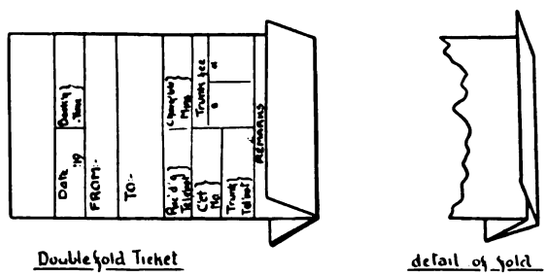

Fig 6.

RECORD TABLE OBSERVATIONS AT THE LONDON TRUNK EXCHANGE.

It may be interesting to give some statistics of the results obtained by the observations on the London Trunk Exchange Record Tables during recent years.

The results of the observations for the last six months are an improvement on any records in our possession.

RECORD.	1919.	1920.	1921.	1922. ½ year.
Average time from glow to challenge ...	3.3	3.1	2.6	2.4

DEATH OF MR. J. H. ANDERSON.

NEWS of the death of Mr. J. H. Anderson was received in the Controller's office with genuine sorrow. Mr. Anderson, who had been away from duty for some months, passed away at Brighton on June 30, in his forty-third year. The funeral was attended, at the request of the L.T.S. Supplementary Clerks' Association, by Mr. Willis, who was the bearer of a wreath from the Controller and staff. Mr. J. H. Anderson, senior, has expressed his warm appreciation of these expressions of sympathy from his late son's Chief and colleagues.

Mr. Anderson joined the staff of the General Manager in June, 1902, when its members could be counted on the fingers of two hands. He was thus on the staff for 20 years, during which time he saw tremendous changes. Widely read, and possessed of a keen intellect and remarkably retentive memory, Mr. Anderson's undoubted abilities earned for him establishment as a Third Class Supplementary Clerk in 1909, and promotion to a Second Class Clerkship in 1913. He was attached to the Accounts Branch during the whole of his service.

THE TELEPHONISTS' COLUMN.

"TALK OF MANY THINGS."

NEXT month we hope to have a design at the head of this column drawn specially for us by Mr. Niblock, of Regent Exchange. Mr. Niblock's work has been reproduced on many occasions in the pages of this JOURNAL, and we are very grateful to him for his help. As one of our contributors aptly remarks:—

> "I cannot help smiling. We have vowed this shall be a truly feminine column, and that man shall be rigidly excluded; when, lo! the first thing we do is to call upon man for his aid. Which, of course, if one ponders on it, is the best proof that this column is really, truly feminine!"

As further proof of our femininity, we have approached Mr. John Lee with a view to his writing for this column from time to time, and we are glad to say that he has consented to do so. We have a very happy remembrance of Mr. Lee's delightful play, "The Transformers," and of his paper read at the Telephonists' Society, "Hints to Telephonists on Writing Poetry," and look forward with the keenest pleasure to Mr. Lee's contributions.

Referring to the Postmaster-General's assertion that Aberdeen's "speed of answer" is 2.1 seconds better than London's, the *Bystander* breaks forth:—

"The girls who live in Aberdeen,
Are quite the best he's ever seen;
And those who work at Edin-borough
Are just as splendid, smart and thorough—
While England, I need not explain,
Just gets it in the neck again."

To which we retort:—

"The girls who work in London town
Are innocent of pout or frown;
They each possess the 'smiling voice,'
That makes subscribers' hearts rejoice;
While Scotland's brogue forbids, 'alas,
Poor country!' any smile to pass!"

Or, as a subscriber might have put it—but didn't:—

"The voices heard at my Exchange,
So sweet, so musical their range,
That I could wait an hour with ease
To hear their tuneful 'Number please?'
'Two *seconds* more!'—not *half* enough;
No 'granite' I—but softer stuff!".

TO-DAY'S GREAT THOUGHT.

"Women are not such fools as men."—
Sir James *Cantlie*.

We know he can't!

A suggestion has been made that it would be of interest, as nearly every exchange has its library, to ascertain the favourite authors and favourite books of readers of this column. At Gerrard, Zane Grey, William J. Locke, Ridgwell Cullum, and E. M. Dell are still very popular. Gerrard would like to know what books are in special favour at other exchanges. This should provoke a good discussion, and we shall be glad to have some names and titles for insertion next month.

We hope shortly to give particulars of a competition, for which it is hoped that there will be a large number of entries. Tom Webster, in one of his inimitable cartoons, tells of a race where a silver-plated jam dish was the fourth prize. "Fancy," he says, "a man who doesn't like jam running 26 miles only to be told he has won the fourth prize!" We hope *our* prizes will not come under this category, and that they will be acceptable to "jam" and "anti-jam" entrants alike.

A Rhyme "In Season."

"ANNUAL LEAVE."

Seven months of weary waiting,
Seven months anticipating;
Seven months that seemed unending
To the wondrous time impending.

Just one week of haste and hustle,
Just one week all brisk and bustle;
Just one week of desperation
Spent in earnest preparation,

Sorting garments old and new,
Getting in an awful stew,
When you find a doting mother
Lent your suit-case to your brother.

One night more, too tired for sleeping,
Woeful to the point of weeping;
Thinking shall you live the morrow
That shall banish all your sorrow.

Then the joy of rising, dressing,
Leaving with parental blessing.
Train is packed to suffocation
Till you reach your destination.

Just two weeks of life ecstatic,
Just two weeks of joys emphatic;
Just two weeks in which you live
Every minute God doth give.

Then —— but 'tis not my intention
To be cruel enough to mention
In the midst of all the laughter
Telephones must follow after!

DOROTHY TURNER.

Contributions to this column should be addressed: THE EDITRESS, "Talk of Many Things," Telegraph & Telephone Journal, Secretary's Office, G.P.O. (North), London, E.C.

LONDON TELEPHONE SERVICE NOTES.

London Telephone Society.

THIS Society will commence its 14th Session on Oct. 13, when Mr. G. Buckeridge will read his Presidential Address. The Meetings are being held at the Y.M.C.A. Lecture Hall, 186, Aldersgate Street. This is so near to Headquarters that it is hoped a greater proportion than usual of the male staff will be induced to attend.

The remainder of the programme for the Session will be as follows:—

Date.	*Subject.*
Nov. 3, 1922.	"The Opening of New Exchanges." Mr. H. L. Pountney.
Dec. 1, 1922.	"Wireless Electrophone" (with Demonstrations). Mr. Gibbons.
„ 30, 1922.	Annual Dance.
Feb. 2, 1923.	Annual Competitions.
Mar. 2, 1923.	Essays and Letters.

The Meetings commence at 6.30 p.m.

* * * *

"Five" and "Nine."

Much prominence has been given lately to the confusion which occasionally occurs between the spoken numbers, 5 and 9. Many suggestions to remove the difficulty have been made in letters to the Press, but the most useful preventative of all, viz., clear and careful articulation and enunciation, seems to have been overlooked. This is not the place to repeat the rules relating to the repetition of numbers which are well known and practised by the staff, but one may be permitted to remark that if subscribers would give close attention to the numbers repeated by the telephonists and acknowledge that the repetition is correct, much trouble would be prevented.

Many rules could be given which would assist in eradicating the trouble, but unfortunately, the average caller is in a desperate hurry and gives no time to niceties of expression. The most important thing to remember when using the telephone is that the listener is deprived of the advantage of watching the speaker's lips and, therefore, all consonant sounds should be emphasised. There is too much slovenliness of speech over the telephone.

Most of the suggestions published in the Press propose calling the 5 or 9 by some other name. One writer says, "Why not substitute the letter 'M' for either the 'five' or 'nine'? It would be quite easy to ask for 'M8M2' instead of '5852.'" We wonder if the writer thought what it would sound like to ask for "Museum M23M." Another writer applauds the idea but finds fault with the use of the letter "M" and suggests "V" in its place; "Battersea V3V3" does not sound easy. In these cases it is suggested that the letters should be printed in the *Directory* in place of the figures, leaving it to the telephonist to translate. Other writers suggest

Digitized by Google

re-christening the "nine," but it is almost certain that such a radical alteration would meet with the same fate as the recent "Keep to the Left" campaign; nobody would observe the new rule.

Another ingenious correspondent suggests the word "nap" instead of "five." Poor telephonist! Imagine a card enthusiast finding 1235 in the *Directory* asking for "Ace deuce trey nap."

No—there is no short cut towards the elimination of phonetic difficulties. What appears to be an easy solution is very often no solution at all. The only remedy is constant care—giving more and more attention to what may seem to the caller the least important part of the call, *i.e.*, asking for the number.

* * * *

Contract Branch Notes.

Automatic Working at Subscribers' Premises in London.

The introduction of Automatic Private Branch Exchange working in London has received considerable impetus by the decision of the London County Council to adopt automatic working at the County Hall, Westminster Bridge Road, S.E.1. Already several subscribers have decided to have this system of internal working installed in connexion with their exchange lines, but the size of these installations is small compared with that to be provided at the County Hall. An order from the Council has been received for the provision of 400 automatic extensions and an order for 200 to 300 additional extensions is anticipated almost immediately; it is expected that a maximum of 900 extensions will be required ultimately. With an installation of such magnitude and in a building so large as the County Hall—there are nearly 1,000 rooms—exceptional arrangements have had to be made to simplify the work of fixing the rental of the various extensions. To enable this to be done, a schedule of hypothetical distances from the switchboard to every other room in the building has been prepared, from which it is possible to tell at a glance the rental of any extension.

Culled from the Exchanges.

Central Exchange.

The Eldorado Swimming Club held their second Annual Gala at the Pitfield Street Baths on July 28. There was a splendid attendance and as is usual at these affairs there was much excitement and enthusiasm.

In addition to open events there were the following confined to club members and to the L.T.S. :—

33 YARDS CLUB HANDICAP.

Miss I. Clements, 9 seconds	1
Miss R. Rawlings, 15 seconds	2
Miss F. E. Knight, scratch	3

Won by a touch.

33 YARDS SUPERVISORS' HANDICAP.

Miss Davis, 2 seconds	1
Miss Spalding, 10 seconds	2
Miss Drew, 11 seconds	3

A touch only, separated the first and second, and second and third.

133 YARDS INVITATION TEAM RACE.

Regent Exchange (Misses Williams, Phillips, Broomsgrove, Cole)	1
Central Exchange (Misses Izzard, Snowden, Knight, Milbank)	2
Gerrard Exchange (Misses Wilson, Burt, Smith, Davis) ...	3

Won by a touch.

100 YARDS CLUB CHAMPIONSHIP.

Miss F. E. Knight	1
Miss M. R. Milbank	2
Miss E. Snowden	3

Won by six yards.

PLUNGING.

Miss M. R. Milbank, 39 feet 2 ins.	1
Miss L. Izzard, 36 feet 1 in.	2
Miss D. M. Jones, 32 feet 11 ins.	3

67 YARDS HANDICAP (LOTOS S.C.).

Mr. G. Frier, 6 seconds	1
Mr. G. Feed, 16 seconds	2
Mr. J. North, 6 seconds	3

Won by half a yard.

* * * *

City Exchange.

The care of those disabled in the War is a matter of keen interest to the staff, and up to July £50 was forwarded to St. Dunstan's and £20 to the War Seals Foundation as a thank-offering.

A TROUBLESOME WHEATSTONE TRANSMITTER FAULT.

WHEN receiving Wheatstone Morse by slip or Creed a troublesome fault sometimes appears showing missing dots and dashes or running signals, or both missing. Running in otherwise perfectly shaped signals, the faults partly or entirely disappearing on the slip being re-run.

Commonly, the repeater station, if any, is called in to watch the re-run, which is then good and the fault is attributed to the receiving apparatus. The sending station if asked will usually report that the slip is apparently good and traffic is resumed only to show the same fault shortly after.

Perhaps a perforator whose slips give faults is identified and at request disused, but as its slips may cause no complaint on other circuits, it will probably be brought into use again shortly. The fault should be traced at once, if possible, and the following method is suggested :—

If signals at trial were good, but traffic shows occasional missing or running signals with certain slips, and if on re-run the faults disappear, or some of them do, the signalling station should be asked to examine the slip at certain specified signals that failed. If they appear good the transmitter should be suspected. The repeater station should be called in to watch *new* slip as it runs in traffic. If the faults are observed at the repeater station also and are partly or wholly absent on a re-run, and the sending station reports his slip apparently all right, the fault is almost certainly due to a transmitter selector, spacing or marking, as the case may be, or both selectors if the fault is both missing and running, being adjusted with unequal margin of clearance as they rise into the signal holes. Consequently, in some slips slightly imperfect the selector just strikes the edge of a hole and fails to reverse the current. The edge of the hole, however, will be lipped, and the selector probably pass up freely in a re-run.

The fault generally arises through a Gell or Kleinschmidt peculiarity not shared by the Wheatstone stick perforator. Each time a space or a character is punched all eleven centrehole punches act. so that except after the figure nought some centreholes have been punched two or more times, and as the paper channel and the star wheel mechanism wear the position of the paper under the punches varies slightly, and the repunchings enlarge the centreholes or make them eggshaped, though the dies are as perfect as in the stick perforator.

The transmitters previous to issue are often apparently adjusted in the workshop with Wheatstone perforator slips, the centreholes of which being only punched once are therefore uniform in size, and unless obviously dragged on the starwheel through faulty paper feed are always circular and in perfect line with the signal holes, so that a transmitter adjusted with the selectors entering only just inside the signal holes will run without once catching the edge of a hole, while if the centre hole be eggshaped forward and the selector be biassed to the forward edge, the hole might not now be taken sufficiently far forward to allow the selector to rise clear and reverse the current. The blow on the edge, however, would lip the hole, and the selector would probably clear through if the slip is re-run.

The fault is rather elusive, and as the slips will look quite good at the sending end, and may run quite correctly on other circuits, the officers at that end are sometimes reluctant to make the necessary change, which, after the fault has been so proved, should be insisted on.

It occasionally happens that a series of transmitters will all show this same fault, and enquiry show that they were all set up by the same mechanic on one system, and proved with a slip from a Wheatstone perforator. Such a series has been encountered from more than one large station and individual transmitters from many places.

The fault described frequently gave trouble in the early days of Gell perforators in the C.T.O., and complaints especially on new wires of misfitting slips were raised and the Gells put out of action until the rule was adopted of changing any transmitter which misfitted such slips. The transmitters are now adjusted so that Creed slips, which often show very considerable deviation from perfection, are commonly signalled correctly. Both Gell and Kleinschmidt perforators also are now very accurately adjusted by the C.T.O. mechanic staff and show very little mutilation of centreholes.

There is plenty of difference between the size of the selectors and the size of the signal holes to allow considerable variation of position of the signal holes if the selectors are centrally placed, so that any slip which looks nearly right should run correctly.

Other faults in Wheatstone working are generally due to more obvious causes. A.C.B.

AT A RADIO 'PHONE PARTY.

A TREMENDOUS boom in wireless telephony is proceeding in the United States. Ring W. Lardner, a humorist with his own brand of orthography, gives the following impressions of a radio party across the Atlantic :—

I don't suppose by this time that they's more than a few families left in the world that ain't got a little radio in their homes, though personly we are still without one as you halfto pay cash for same.

But my village has got its share of the machines, and I've been lucky enough to be invited to a couple homes where they had them and will admit

Digitized by Google

they are a great institution and libel to go a long ways towards keeping the men and boys in at nights though in a good many cases I would rather have them out if I was mother.

The places I have been to hear them, why they was connected with sending stations in Newark, Schenectady and Pittsburgh and if you didn't like the program that was going on one place why you could change plugs and switch to another which sounds like a grand scheme but the trouble with it is that you pretty near always seem to go from bad to worse.

Well we started out one night with Schenectady and heard a voice say that the program would open with the baseball scores for that P. M. and he says St. Louis or somebody had beat New York in the American league by a score of 6 to 4 and just as he said it the instrument let out a terrific blatt and I thought maybe it was the pitcher squawking to one of the umpires but our host said it was static.

Whatever it was we did not hear no more baseball scores but personly I didn't raise no howl about that as I figure that a person that has got any kind of self control can wait for the morning papers to tell how the games came out a specially in May.

Well the next number was a bed time story but it wasn't much more than 7 o'clock and while that may be bed time in Schenectady why most of we Great Neck folks don't hardly ever turn in till 8 and sometimes ½ past so we switched off of Schenectady and cut in on WYZ which is code for Newark.

* * * *

Well a gal started to sing I love you truly and I made the remark that no wonder they was so many murders in New Jersey and another of the boys said he didn't think they had been quite enough.

The next piece was a cornet solo which was mostly what they call triple tongue work and it would of drove me right to Pittsburgh if I had my say, but our host was a bug on cornet playing and set there beating time with his tongue till the last squawk.

When we finely got to Pittsburgh a man was just commencing a speech about a new expedition to the Pole but the next thing you know he was makeing a political speech about what a big mistake it would be to cut down the personal of our navy just at this time and here is his speech verbatim as near as I can remember same :

"With the far eastern question still unsettled in spite of the forward strides taken by the disarmament conference in Washington, now is surely not the time to reduce our static squawk blash ma-a-a-a.

"No country on the great green foot stool desires peace more earnestly than the U. S. but blah, biz-z-z-z-z, dot, dash, two dots, dash, ma-a-a-a-a."

The host informed me that these last few noises was a police station cutting in but I don't know if they got the fellow or not.

The closing number of the program from Pittsburgh or whereever we was switched to by that time was a reading from Shakespeare by one of these here gal elocutionists, and this seemed to be the real bed time story of the evening or at least I noticed pretty near everybody in our party acting kind of sleepy before she was half-way through with it.

* * * *

Well they tell me around here that the theatre managers and opera managers and &c. is kind of leery that the radio folks will sign up some of the star song birds and comedians and &c. and the next thing you know these people would be singing or springing their gags to a audience of 2 or 3 million people a night without the audience paying a penny to hear them and in the case of most of the divas and tenors why you could enjoy them a whole lot more if you didn't half to look at them while they was singing. This is what made grand opera gramophone records so popular.

Well the time may come when they will have entire radio programs and will keep you thrilled all evening but I ain't heard one yet that a person wouldn't run a few wave lengths to miss the most of it and the majority of the performers seem to be cornet players and readers and speech makers that wouldn't dare to do their stuff if they was where you could get at them.—*Dundee Courier.*

CORRESPONDENCE.

TO THE EDITOR OF THE "TELEGRAPH AND TELEPHONE JOURNAL."

SIR,—In the *Post Office Engineers' Journal*, April, 1922, is an article on "Baudot Distributor, Correction of Speed by Control of Vibrating Reed." In this article are the following words :—"The system has been in service for some months on several Baudot duplex circuits in the C.T.O., and as the results have proved satisfactory, its use is being extended."

In April last the system had been tried on *four* duplex Baudot circuits. This is giving the word "several" a quite correct but very generous usage. The system was tried on T.S.-L.V.$_2$, and without being in a position to consult records, I think I may safely say that during a period of about three months it was never satisfactory from the traffic point of view. It was tried on T.S.-G.W. but with similar results, and it has never been successful on any Baudot duplex which needed to carry a full load. It has had some success where only two arms were required.

Despite these well-known facts, the device has been sent out for general use and with the results that could easily be foreseen by those who knew. It has been set up for use in places where a four-arm duplex Baudot is almost the only provision, and where four arms are needed to take the traffic. It works all right for two arms ; for three with great difficulty and careful nursing ; with four arms practically not at all.

It is not my purpose to waste your time with the discussion of the causes of this "unsatisfactoriness," but simply to focus attention upon it. As it stands, the thing is a nuisance to all who have to work it, and to those responsible for the traffic it ought to but cannot assist.

The above-mentioned article in the *Engineers' Journal* states : "It simplifies the construction of the distributor, as the epicyclic gearing . . . is dispensed with."

That is, it is cheaper—its one merit ; but against this saving must be set cost of the extra correcting relay and its appurtenances and—the main item—an enormous loss of efficiency as compared with the old mechanical correction.

"DIRIGEUR."

Aug. 15, 1922.

THE FIVE UNIT SYSTEM.

TO THE EDITOR OF THE "TELEGRAPH AND TELEPHONE JOURNAL."

SIR,—Mr. Cousins is mistaken. I carefully read his notes on the "Principles of the Five-Unit System" and am under no delusion concerning the meaning he intended to convey.

I appreciate that portion of his notes in which the two alphabets are compared, but when Mr. Cousins follows up with the startling statement that a Wheatstone Duplex line, which will work at approximately 85 words per minute, should work 120 words per minute (normal speed) on Baudot Quadruple Duplex, it is only reasonable to expect that such a contention, having as it does, an important bearing upon some of the traffic-handling problems faced by telegraph administrations, should be supported by something concrete.

May I explain here, Sir, that my challenge is not borne of any spriit of animosity towards the Baudot System. It is an excellent system, and I like it very much ; and as an earnest student of mechanical devices for many years past, I can appreciate the wonderful ingenuity and admirable design of the working units of this system, but, however wonderful the Baudot, or any other system may be, the greatest care should be taken in advancing absolutely reliable data when making comparisons between them.

If Mr. Cousins can really convince me as to the possibility of obtaining a 30 per cent. traffic-handling increase by substituting Baudot for Wheatstone on an 85-words-per-minute line, then, Sir, I will humbly crave his pardon for doubting his statements, and yours for causing you to waste valuable space in your JOURNAL.

Mr. Cousins has made this very definite statement, and many telegraphists in Great Britain and abroad, as well as myself, will look to him for further enlightenment.

He has admitted that he was mistaken in stating that Multiplex Systems filled the line with working signals. Perhaps he will now go further and answer the queries raised in the latter part of my letter which you were kind enough to publish in the July number.—I am, Sir, Yours faithfully,

ARTHUR JAMES POLLEY.

Telegraph Works, Croydon,
Aug. 11, 1922.

PERSONALIA.

The following officers resigned for marriage during the month of July :—

Telephonists.

Miss K. M. STREETER, Central.
Miss K. N. SIBLEY, Central.
Miss R. COPPIN, Central.
Miss C. J. DAVIES, Central.
Miss W. A. F. ROBB, Central.
Miss I. WEMYSS, Supt's. Office, F.E.S.
Miss V. M. SMITH, Chiswick.
Miss W. A. FORD, Sydenham.

Principles of the Telephone

Part I. Subscribers' Apparatus. University of Wisconsin Extension Series. By CYRIL M. JANSKY, B.S., B.A., Associate Professor of Electrical Engineering, and DANIEL C. FABER, E.C., Assistant Professor of Electrical Engineering, The University of Wisconsin.

160 *pages,* 6×9, 125 *illustrations, published in both loose leaf and book form.*

7/6 Net, Post Paid.

The principles that underlie good construction are set forth clearly. It emphasises the operation of different types of subscribers' apparatus and methods of locating and correcting faults. In preparing the book, the authors utilised every advantage of contact with the men engaged in the industry. The manuscript was tested thoroughly in mimeograph form before being released for publication. Two supplementary volumes covering central office equipment and outside construction are in preparation.

CONTENTS.—I Introductory. II. Elementary Electrical Principles. III. Magnetic Principles. IV. Sound. V. Transmitters. VI. Receivers and Induction Coils. VII. Signalling Apparatus and Circuits. VIII. The Subscriber's Telephone Set. IX. Local Battery Systems. X. Common Battery Telephones. XI. Faults in Substation Telephone Apparatus. XII. Protection of Telephone Lines and Apparatus. XIII. Installation. XIV. Party Lines. XV. Intercommunicating Telephone Systems.

EXTRACTS FROM LETTERS HOME OF A YOUNG TELEPHONE ENGINEER.

(SENT OUT TO INDIA TO INSTAL AUTOMATIC SWITCHBOARDS IN THAT COUNTRY.)

(*Continued from page* 180.)

Tuesday, Aug. 23.—My wireless telephone friends' stunt is over and they have, to use their beautiful expression, "dispersed." One of them has gone back to his headquarters in Peshawar (where he will doubtless be baked to cinders, poor chap) and the other I have just deposited in the local hospital with malaria. How a fellow can get malaria in a climate like this, I don't know—perhaps it's the mosquitoes, of which there are legions—all of the carnivorous species.

I miss them rather, though it's just as well that they're gone for it was a fearful tight squeeze, the three of us in one room. There were only two beds, too, and they, coming first, had collared them. Hackett (the engineer here) lent me a camp cot, a wonderful thing that folds up and goes into one's waistcoat pocket when not in use, so to speak. Unfortunately, the thing hadn't any frame for mosquito curtains so I had to rig one up with odd bits of telephone wire—I managed to make quite a decent job of it, I think. At least the contraption had the merit of being flexible—in fact, when the curtains were put on it, it resembled nothing more than a blanc mange. However, it served its purpose for the best part of a week and kept the man-eaters off me, so I felt quite satisfied with my handiwork. Unfortunately this beautiful example of my engineering skill did not meet with the approval of my worthy squire Abdul. From the very first he showed a marked distaste for anything appertaining to this monument to my ingenuity.

Friday, Aug. 26.—I am safely installed in the "Napier" Hotel now. It's not much of a place, though it's as good as any of the others in Poona—I suppose you can't expect too much in a country place like this. They call Poona "The City of the Marathas," though it's little more than a village. But for its racecourse I don't suppose it would ever have been heard of.

Everything up here seems to rejoice in the name of "Napier." There's the Napier Theatre just opposite. A pretty dud show I expect, I haven't bothered to go there yet. The turn this week is called the "Turnee Parisienne," and is advertised as having the attractions of "French Songs, French Dances, and French Artistes." The latter are living in the hotel here—they seem a weird lot. I can't understand their language at all now, I believe I could have done once, just a word here and there, enough to be able to make out what they were talking about. What I've learnt of Hindustani coming in seems to have driven all I knew of French out.

It's very easy to pick up Hindustani. That is, the sort of Pigeon-Hindustani that the coolies talk—the real high-flown language that the Rajas and people talk is pretty difficult—and very beautiful, I believe. The construction of the sentences is queer—they never say such a thing as "I don't know" (or, to cut out that terrible English verb "to do," I know not), they put it round the other way and say, "Me-to, knowledge not is." It sounds a bit funny, doesn't it? You'd be surprised how easy it is, though, to get into the way of speaking backwards, so to speak. I think, if a man didn't know any language at all, he would find it easier to learn to talk "backwards," as we call it, than to talk ordinary English. That, you will say, is absurd, but you ought to try swotting up Hindustani grammar for a few months, and see how much more easy it is than English.

Sunday, Aug. 28.—Most amusing thing happened this morning. Terrific argument between the three French gentlemen of the one part, and the native manager of the Napier of the other part. They started off in English—thick, guttural stuff from the throat of the manager, with a background of Hindustani floating down on the breeze from the native hotel servants in the compound. On the French side we had a rather high-pitched and nasal jabbering from the men, supported by their three maidens murmuring sweetly and continuously in their own language. The whole show was conducted on the veranda and in the compound just outside my door. As I sat in my room, complimentary remarks in the three languages concerned were wafted in to me. It sounded something like this: From the manager, "Hotel you will not leave until bill is paid man." Then, simultaneously, a string of Hindustani from the manager to his supporters, followed by a swelling of the approving murmurs in that quarter, and a string of French from the linguists of the concert party for the benefit of their females, which was also followed by an increase in the tone of the supporting murmurers. After the manager's remark was argued over by the French, the linguists took the field once more. "Ve vill geef to you fourrteen rruepais for day for ze rrom," followed again by some jabbering on both sides. Eventually they seemed to get fed up with the translating part of the business and everybody shricked at the top of his voice in his mother tongue. The whole thing lasted for three hours, during which time all the most offensive language in English, French and Hindustani was used—I don't know how it ended up—if it did end up at all—I lost the sense of what was going on when they left off speaking in English.

Wednesday, Sept. 21.—In Poona, as by this time you probably know, we have two race days a week, usually. Also, in common with the remainder of the civilised part of the globe, we have one Sunday per week. If your maths. are strong you will be able to gather from this that there are four working days in every seven. If you are an inhabitant of Poona you apparently find this arrangement both ordinary and pleasant. As I haven't yet lived here sufficiently long to be able to feel like an inhabitant of the place, I find the arrangement both unpleasantly extraordinary and extraordinarily unpleasant.

There is, between my lineman and myself, a sort of unspoken and never-to-be-alluded-to understanding that he will not appear at the exchange, and must not be expected to appear there, on race days. If, on Tuesday, he tells me that to-morrow he will bring a new soldering iron down with him, then I must understand that he is speaking of Thursday. I have spent a long time, and undergone many painful experiences, in learning this. Now that I understand, I don't feel very comfortable about it. It's very annoying to have to work alone down at Ganeshkhind two days a week—more so, when the operators go for their afternoon sleep, and I find myself left to work one switchboard when I am installing another.

My lineman, who is, relatively, a pretty good worker, always looks pained on Thursday if I refer to anything I have done in his absence on Wednesday. He seems to think that for anybody to work on a race day is a wicked thing. I found him this evening hanging round Poona Main Exchange, waiting for the results of the races to come through from the racecourse. He held a paper in his hand—his receipt for RS.7/8, that he had put on some horses. Now that lineman, like the rest of his tribe, receives, I think, a wage of one Rupee a day—at any rate, it's thereabouts. So he was gambling in one day alone with the whole of his week's pay, and he told me quite cheerfully that half of his RS.7/8 was already lost. Curious, you know.

They're a queer lot, the linemen here. I have one attached to me at Ganeshkhind, and there's a lot more of them at Poona Main. They arrive on bicycles at about ten o'clock in the morning, and stand about in the compound, smoking native cigarettes and talking and laughing just as you would see English clerks in an English office doing an hour earlier. In their dress and their religion (they're mostly Hindus hereabouts), and their ideas they are purely native, yet they will "talk shop" in a mixture of Hindustani and very complicated technical English. They can even read and write technical phrases in English. An expression like "Order wire ringing key" is as much their language as it is ours. You have to understand a little Hindustani to follow them, of course. In English we might say of a particular wire, "Earth for the sleeve of the jack." They call it, "Earth, jack-ke sleeve-k'wusti"—either of which will be equally intelligible to *you*, no doubt.

They seem to know as much technology as an English telephone engineer—Heaven alone knows where or how they pick it up. They're all practically without any education as we understand it in England. All the natives seem to take very kindly to the telephone and treat it as being a perfectly natural thing for the Sahib to arrange, just as he has given them motor-cars, and railways and electric lights. You see the most low-caste native paying his Rs.1/4 to make a trunk call to Bombay to put some money on a horse in one of the "bucket-shops" down there. Listening in on the telephone, you may hear telephone conversations going on in umpteen different languages—Hindustani, Gujerati, Marathi, and as many more that I don't even know the names of. Oddly enough, the natives always start their conversations with "hello." Some of them will even not be able to give the number that they want in English, yet they must always say "hello" before they start to speak—perhaps they think it's a sort of "open sesame" without which the apparatus won't work.

The natives, in their absolute refusal to marvel at anything that the Sahib invents for their convenience or otherwise, are very disappointing. You would think that the spectacle of a train, with its smoke and steam and noise and speed and fire would be at least a thing to astonish them, even if it didn't scare them—especially as in many places a train only passes once a day. Yet they don't seem to be a bit impressed by it. They seem to enjoy railway travelling rather than to be afraid of it. The sight of a family on the move is a very common one. The man in front, and the women and children, with the babies on their backs and all their worldly goods and chattels on their heads obediently following in the rear. When they get to the station the man fumbles in the folds of his "dhoti" and produces a quantity of small change with which he buys their tickets. They travel about 50 miles for the rupee. If there happens to be a train just due to start, they won't trouble to hurry to catch that one, but will squat down on the station and wait till the morrow for the next one. In the evening they take out their cooking pots, make a great meal of curry and rice, if there happens to be another family there of the same caste they combine. When the meal is over the man smokes his hooka while the women scour out the pots with mud. At all the stations there are two great earthenware jars of water—one for Hindus and the other for Mohammedans. At the bigger stations small boys, not overburdened with clothes, walk round with trays of tea cups on their heads, crying "Cha-a-a, Gurrum Cha-a-a" in much the same tones that small boys walk about the Strand crying, "News, Evening News."

At many of the stations hawkers come around the trains trying to sell things to the Sahib. You can generally tell the industry of the district by the things they bring you. Round Asansol way, for example, they're obviously iron workers. Weird knives and such like get thrust through the carriage window at you. At Jubblepore they sell "curiosities" made in brass and in ivory—wonderful models of carts and elephants and temples and things some of them are. Extraordinarily fragile and delicate. At another place, whose name I can never remember (it starts with "A" and ends in "bad") they sell beautiful carpets, and most remarkably cheap. You can hardly expect a chap to lug a carpet about with him, though, can you? True to their practice of representing the industry of the place by the things that they would sell, in Poona the first and everlasting thing that you are asked to buy is "Race Boo-oo-ook." When I landed here first a little boy howled it at me. He, and the rest of his tribe have been howling it at me ever since. They jump out in front of my motor bike when I'm on my way to Ganeshkhind and wave it at me. They rouse me in the morning by shouting it in the compound. They prevent my going to sleep at night by doing the same thing.

I don't know who invented racing, but whoever it was—well, I dislike him.

THE BUSINESS MAN AND THE CIVIL SERVANT.

BY EUSTACE HARE.

THE term "business man" is so vague and comprehensive that the more one tries to attach a precise meaning to it the denser grows the confusion of ideas. Usually, and therefore, perhaps, wrongly, it is associated with the pursuit and acquisition of wealth; and chief among the followers of this delightful occupation may be cited merchants, manufacturers, stockbrokers, company promoters, shop keepers, and, generically, Fleet Street. Occasional failure to meet liabilities does not, even necessarily imply a spurious claim to the title; because the astute business mind, forseeing disaster, not infrequently arranges matters so that from the ashes of bankruptcy some residual solids may be sifted wherewith to lay the foundation of a new venture. Otherwise he is no more the "business" man than the employee who served him or the creditor who trusted him: a poor creature, reminiscent of the bygone Dombey and Joe Sedley type; to be mentioned by quondam friends with a shoulder shrug in an interval of golf gossip, or at the bridge table between the deals.

Perhaps, however, the most popular conception of the "business man" lies in the ownership of a private commercial concern; the man who has a business of his own, inherited, or built up by his own exertions. An enviable autocrat in his sphere, large or small, with powers of selection and rewards and punishment; at whose nod or whim a wage-earner may become wageless, and who holds in his hands the happiness or misery of dependent households. On the other hand, the interests of employer and employee are mutual, and the reward to the faithful and serviceable is usually generous, partly in recognition of ability and partly from a wise apprehension of the snaring of a valuable ally by an enterprising competitor. For the slacker in a private business there is no room; anyone is welcome to him.

Herein lies some danger to private enterprise in these days of strength in unity. It is often the policy to pay handsomely the one or two at the top and to leave the rest—nowhere; with the result that the youth of wide outlook but scanty parental means seeks employment in the larger concerns, where opportunities are many, rather than await competence and advancement in the prospect of an empty pair of shoes. While in all big businesses there are nooks and corners for jobbed-in idlers, there are also many-runged ladders for the meritorious and efficient. The affair is too large to be affected by a few incompetents: superior minds are always at hand to cover their lapses, in lofty magnanimity, and the failure of one may be the stepping stone of another; stepping stones being useful things, but easily kicked aside when they have served their purpose.

The old-fashioned, plodding shrewd business man of popular imagination is gradually dying out, and from his ashes arise the chairman, board of directors and manager responsible once or twice a year to a proprietary force of shareholders, friendly or critical according to the dividend. The evolution of speed and of easy communication with the corners of the earth has broadened the horizon and enlarged the ideas of the whole world, and no part of it is more susceptible to change than the commercial.

So that, whether he be born in the purple and—with the wholesome bloom of public school influence still upon him, finds his business career surely and distinctly mapped out, or whether he start with nothing to hand but endeavour and a calculating mind,

Digitized by Google

the commercial novitiate is no longer content to see visions, but advances at once to realisation and gratification, somehow, anyhow; beginning where the last generation finished. There is too much to be done and to be enjoyed in the whirl of current existence to admit of any waiting upon Time.

Therefore he makes his business solid and stable, if he can; if not, showy; which, gulls being ever on the wing, may achieve the same result. Advertisement in any form is recognised to-day as the touchstone of success; in the flaunting crudities of the hoardings, the luminous flappings on the housetops, the issue of specious prospectuses headed by reputable names for the behoof of feverish investors, artful beckonings to the impecunious and subtle invitations to those seeking physical perfection inside or out. Even an expensive establishment, a well-appointed car, a polished manner and well-cut exterior may serve the same purpose, if adequately shop-windowed. Speculating on the weaknesses of mankind is no new phase, but somewhat accentuated in these days, and so far from being deemed a disreputable weapon in the business armoury is regarded rather as a mark of enterprise—a word associated once with lofty aims, but drifting fast into more sordid company.

It was remarkable how the business mind scented, and leaped to the advantages created by the War; from the man (or woman) with a house to sell to the coster with his last barrow-load of bananas; monopolists all. And even the most scrupulous—if such a term be consistent with the situation—could soothe his conscience with the assurance that he was merely following the unerring laws of supply and demand; that Shakespeare who wrote about "a tide in the affairs of all men" was with him, and that what everyone else was doing could not be wrong.

One of the uses of advertisement is fast disappearing; and that is, cheapness—not the cheapness of shoddy, but the possibilities of small profits on large and quick returns. Monopolies created by combination, the compunctionless annihilation of the small trader are displacing competition; so that it is the man who cries his goods the loudest and is most pertinacious in his wall-chalking that commands the widest custom. The fixing of prices is no new thing. To check rapacity it was done in the Middle Ages, but on a more satisfactory—to the consumer—principle; for, whereas a fat capon was not to be sold at *more* than fourpence, the present mode is that it must not be sold at *less* than ten shillings and sixpence, or thereabouts. The more ancient rule still left, be it observed, a loophole for competition.

I do not suggest that the trader or so-called business man of to-day is less scrupulous or fair than he of a bygone time or of any time; only, in the process of development, his views and aims have expanded. If we were all business men and had to depend on our astuteness and acuteness as distinct from knowledge and perseverance, for our livelihood, we should all be very much alike; and if we all lived by taking in each other's washing, the man who washed the best would come atop. The business man can no more change his spots than the leopard; and no one expects him to do so.

But, after all, is the business mind only to be found in the trader or what is known as the "business world"? Turn the phrase "business man" into the "man, or woman, of business," and with one exception—which I shall come to later—he or she is to be found in every path that leads to success. He and she are ubiquitous; the farmer, the lawyer, the doctor, the matron of the hospital, the bishop of the diocese, the head master or mistress of the school are as much dependent on, or chosen for, their business acumen and perception as the man who cuts your clothes or buys your shares.

Even Art and Literature are not immune from the business spirit, from the feverish craving for immediate gain and notoriety; so that in place of good, ennobling work, we get fantastic, startling, artificial rubbish, with the mark of genius here and there distorted or half obliterated, prevented from running its natural course by the lure of self-advertisement and the speculative hope of catching at once the public taste and money. Not such a very difficult achievement in these days when the gaps between the strenuous pursuits of business and games must be filled up by what is amusing, arresting and, perhaps, a little shocking. So the young men and women of brains gain followers by following; and, inverting the old order find ready success, or what is deemed such, in a business path of roses. Later, perhaps, when the limelight begins to pall and money is not the pressing object they may take pause to think; if energy and intellect have not meanwhile become blunted.

Verily, the man of business is in this age popular and his hand acknowledged everywhere except in the Civil Service; for between that enclosure and the outer world there would seem to be a great gulf or wall. No new creed this, for Dickens proclaimed it; made merry over it some seventy-five years ago, and so caricatured it that even now, those of us gifted with a sense of humour, can laugh with our forefathers. Nevertheless, we who have read our "Little Dorrit" may think he would have been well advised to have opposed to the tape-bound Barnacle tribe a more level-headed, practical antagonist than Mr. Meagles, late bank cashier. But Dickens himself was an uncommercial traveller, and was not apparently overmuch enamoured of the commercial character, and with the possible exceptions of the Cheeryble Brothers and Mr. Fezziwig, his puppets of the counting house and office were amusing, but little else. And though type and outlook vary, character changes but little.

The age of Dickens, however, was the halcyon age of the private, one-man business; railway companies, insurance companies, even banking companies were in their infancy and the limited liability concern was practically unknown. Those of us who can remember the ruin wrought by the Glasgow Bank failure of some forty years ago can realise the significance of "limited liability," and be thankful that when we lend our cash for the furtherance of commercial enterprise we now know the worst than can happen to us.

The Civil Servant can be anything else he likes—consistent, of course, with his service to the State—amateur musician, painter, author or a crack marksman at Bisley—but he cannot, shall not, must not be a business man, much as he may desire it. How can it be otherwise when popularly, his whole training leads him at every step to mistrust and adjure the use and practice of one of the most cherished assets of the successful merchant or financier—common (or, unaided) sense, otherwise known as "instinct"? Training of any kind usually leads to habits of caution and the weighing of probabilities, whereas to the man whose mind has to be made up on the spur of the moment or he may miss his opportunity, a quick decision with or without reason, a readiness to take risks and an indifference to consequences are the needful qualities. If he succeed he will lay his riches at the feet of the "common sense" which guided him, while any little failures will be the outcome of those occasions when he disregarded the advice of that ready familiar. And the public having the fortunate ones only before them regard them as typical of a class, a class to whom the virtues of sound judgment and organising ability are regarded as the natural and exclusive heritage.

What the public do not understand or consider is the incentive which moves and energises the man of private business, which makes him take risks—with his own money and sometimes that of others in his keeping—which fills him with anxiety, leads him into doubtful transactions and leaves him no spare time for any but the material enjoyments of life. The incentive is the hope of gain; ever more and more. Take away this incentive, and much of the energy and enthusiasm will evaporate like steam in the air. To the business man of to-day there is not the same interest in work, *qua* work, that there was fifty or a hundred years ago; the interest is centred in how much the work will produce, in the vista of a magnificent income and a large estate. On the other hand, the Civil Servant has no other interest but the work itself, except promotion once or twice in a lifetime, if he prove himself able.

Be it observed, however, that in associating the business man with private profit I am thinking only of the owner of a business. Fundamentally the position of a servant of a railway company or a bank is precisely similar to that of a servant of the Post Office. There is no more business training to be had in any one of them than in any other, except of a specialised order, and, as a rule, the officers and staff in each are acquainted with no other sphere of work but their own. The work of the majority is to keep books and to write letters, the ordinary routine work of an office, in which by practice and experience, and by that alone as in every other occupation, their services become valuable. For the minor number, those who have proved their special fitness, there are other responsibilities, the organising, the administration, the vigilant eye, the general discipline, the summing-up of results, the warding off of danger or disaster; a host of cares and difficulties, of which the outer world has no conception. Each concern I have mentioned has, of course, in addition its peculiar technicalities; the railway company its time-tables and the public safety, the bank its scales and scoop, and the Post Office its letter-sorting and telephone exchanges. You may call all this "service" or "public utility," what you will; but if it is not "business" and business of a very high order, there is no meaning in the term.

Howbeit, there is always a danger of flagging enterprise and stunted development in the absence of competition. Strangely enough, notwithstanding the constant attacks that have been made upon the telephone service from its inception, it is far in advance of some other aids—of greater antiquity—to the public welfare and comfort. I have occasionally stayed near a mining district in the Forest of Dean and it seems hardly credible that in this twentieth century the miners (above all other workers) have no water laid on in their cottages and have no encouragement for acquiring the hot bath habit, except from the beckoning of a kettle of boiling water. But, the village has its telephones, and where there are coal mines there must be a railway.

Again, I lived for three years in a village on a main line, only twenty-three miles from the General Post Office. Here there were telephones, a telegraph office, a good postal service, but not a gas or an electric lamp in the place, and even the railway station was lighted, and is still lighted, with oil. Verily, the business man knows better than to volunteer capital when there is no immediate prospect of a return. And as for the red-tape legend, what Government department has ever perpetrated such an inflexible regulation as that which has produced the season-ticket nuisance? Although my nightly train home has a clear run without a stop, and all tickets have to be shown at the London terminus, they must again be scanned at the other end by two officials, blocking egress; with the result that it takes five minutes to clear the platform, notwithstanding the unseemly scramble of young blood whose time is so valuable after they are loosed from business cares. Incidentally the outlet at this station has not been enlarged in the memory of the oldest inhabitant of a place which has blossomed from rurality to a suburb during the last 25 years. This may sound and possibly is trivial; but it would not be counted trivial if a Government department were concerned. As it is, no one complains, no one writes to the papers or to his "member" about it; there is no competition to compel action and, therefore, says the commercial traveller, why should you expect a business company to jeopardise the profits of its shareholders by an outlay for the benefit only of its customers. Absurd!

(To be continued.)

PRESENTATION, BLACKBURN.

MR. S. J. PHARO, Traffic Superintendent, Class II, was transferred to Birmingham on July 1. He was presented by his friends and colleagues with a handsome case of cutlery, spoons, forks, &c.

The District Manager, in making the presentation, conveyed the good wishes of the staff to Mr. Pharo, and referred to his studies in photography, microscopy, also to his jovial disposition and his kindly disposed way of dealing with difficult questions which help so much in the smooth running of work. He has been succeeded by Mr. Morgan, Traffic Superintendent, Class II, who was transferred from Dublin, and the staff extend a hearty welcome to Mr. Morgan and wish him the best possible success.

THE ROMANCE OF THE TELEGRAPH.

BY J. SKINNER (*Brighton*).

IN these days of the rapid development of the telephone, when an eagle-eyed press correspondent at the remote hamlet known as Rookem-on-the-Mud can 'phone his news editor in London a full account of the latest outbreak of mixed bathing within a few minutes of the atrocity, a brief survey of that now sadly neglected and partially eclipsed means of communication known as the telegraph service may be of some interest to our readers.

It is not our purpose here to attempt an explanation of the term "sadly neglected and partially eclipsed," but rather to touch on the romantic side of the telegraph and of that unique body of men known as telegraphists, from the days when the single telegraph wire, winding its solitary way through the wildernesses of the world, was often the chief link in the chain of civilization, down to the present dispensation of wireless and other wonders.

Romance is not generally associated with commercial pursuits, but all of those engaged in the telegraph service for a number of years know something of the joys, sorrows, comedies and tragedies connected with the humble telegram.

The telegraph has accomplished wonders. It has united the scattered inhabitants of our great Empire in such a manner that the pioneer on the very outpost realises that the slender wire, running back through bush and desert, keeps him in touch with all that he holds dear; and the thought strengthens him and gives him courage to endure. The telegraph brings the nations of the world into close contact one with the other, and, metaphorically speaking, places them face to face. International misunderstandings are often promptly cleared away by its agency, for friendly "antagonists" can say: "Come, let us reason together," and, lo! the faithful telegraph flashes the words that make for reconciliation. The free and prompt exchange of opinions, so essential to the world's welfare, is made possible by telegraphy, wired or wireless, and the establishment and maintenance of peace is assisted in no small measure by the familiar telegraph. It is possible that the telephone will soon be a formidable rival to the telegraph in covering long distances—indeed, the remarkable development of the thermionic valve makes it probable—but the debt the world owes to the telegraph will never be forgotten whilst history remains.

In war the service has played its part nobly, and many, many unsung heroes of the Signal Service sleep peacefully in distant lands, having given their all in the service of their country. The craft is for ever ennobled by the devotion to duty of those humble and faithful servants who, in times of greatest peril, anxiety and hardship, just "carried on." Marcus Aurelius said: "I do my duty, that is enough," and our fallen colleagues needed no exhortation to be faithful to their trust.

ITS HEROES.

Yes, the telegraph service has its heroes and heroines, many of whom are unknown to fame. One of the most touching sights the writer saw when on active service was that of a young Indian telegraphist kneeling dead beside his telegraph instrument on the ground, and with his hand still grasping the key. Killed instantaneously in the act of sending his message and doing his duty to the King Emperor. Faithful unto death!

During the Franco-German war a young girl of 18, Juliette Dodu, was in charge of the telegraph office at Pithiviers when the Prussians captured the place, and took possession of the office. She managed to tap the wire which passed through her bedroom upstairs, and was able to secretly forward valuable messages to the sub-prefect who conveyed them across the Prussian lines to the French commander. She was detected, and on being questioned by the military authorities as to her motive, bravely replied: "Je suis Francaise." Sentence of death was duly passed, but fortunately news of the armistice arrived, and the heroine was saved. Subsequently she was decorated with the Legion of Honour by Marshal Macmahon.

Charles Todd, in charge of the telegraph office at Delhi during the Indian Mutiny, fell in the terrible massacre there, but not before news of the outbreak had been safely signalled. It is stated that the last message from the Delhi office led to the prompt disarming of the native regiments in Lahore and Peshawar. Mr. Montgomery, the Judicial Commissioner, declared that the electric telegraph had saved India!

One of the saddest uses to which a telegraph line has been put is recorded by John Fraser in *The Romance of Electricity*. James L. Stapleton was in charge of the telegraph office at Barrow's Creek, Australia, in 1874, when the natives made a sudden attack on the place, killing the linesmen and severely wounding both Stapleton and his assistant, Mr. Flint. The blacks were driven off and it was found that Stapleton's wound was mortal. A telegram was sent to Adelaide describing the nature of his injuries and asking for medical advice. This was done by Flint, although he was bed-ridden and suffering intense pain. "When Stapleton was sinking fast, his wife came to the telegraph office at South Adelaide to communicate with her dying husband, who, on his part whispered his last wishes to the wounded operator at Barrow's Creek; and thus, although separated by twelve hundred miles of scrub and desert, these two exchanged a solemn and sad farewell."

THE "OLD TIMERS."

It would be something of a revelation to the majority of the staid telegraph officials of the present day could Mr. H. G. Well's "Time Machine" be set to work on their behalf, and a trip into the past be undertaken. The "old timer" was often a Bohemian, a happy-go-lucky fellow but a hard worker, and infinitely proud of his calling. The writer remembers an occasion nearly 30 years ago when one of these gentlemen was in charge of a telegraph counter on a Sunday night. This official was always stylishly attired, and usually adorned with several rings and other articles of jewellery. His indignation can perhaps be imagined when a man came into the office and placed a parcel on the counter. The man and his parcel were completely ignored by the august personage who calmly proceeded to balance his accounts. Getting impatient, the man pushed the parcel forward, saying: "Come on, I'm in a hurry." Angrily raising his fist, the outraged official swept the parcel from the counter to the ground and thundered: "Do you take this for a —— pawnshop, mister?" The man left without a word—it is probable that in those pre-war days he could not think of anything suitable for such an occasion.

This same official had an unfortunate weakness—not an uncommon one in those days—and too often filled "the cup that clears to-day of past regrets and future fears." But when quite incoherent and otherwise *hors de combat*, he could sit at a circuit for almost any length of time and receive message after message with accuracy and in beautiful writing. He has, long since, gone the way of all flesh.

At that period it was usual for a telegraphist to give busy stations a signal which indicated permission to send a long batch of telegrams without waiting for the usual acknowledgment at the end of each, repetitions being rare in those days of expert morse working. On one occasion a certain worthy came on duty after unduly looking upon the wine whilst it was red. Sitting down at a busy circuit, he gave the usual "batch" signal, and then promptly went off to sleep! After sending steadily for about half an hour, the distant station asked how things were going, and on getting no reply, commenced to call vigorously. Attention was eventually drawn to the circuit and we will draw the veil over the rest of the proceedings.

AN OLD DIARY.

Fifty years ago interesting events were happening in the telegraph service as they have been ever since. We have been privileged to see the private diary, commenced in 1871 by a former telegraph superintendent, who died in the early eighties. We propose to give a few extracts from the book, and readers will note amongst other items that telegraphists travelled extensively in those days.

Oct. 2.—Mr. C. to Tonbridge to test.

Nov. 4.—The two D's to go to TS on Monday for a few weeks.

Dec. 6.—Messengers C. and W. caught wrestling with a pot boy in their lobby.

Dec. 7 *and* 9.—Eight clerks to TS.

(Similar entries regarding men going to and returning from TS are numerous. Later in the book we find records of telegraphists journeying to Redhill, Gravesend, Epsom, St. Leonards, and Glasgow.)

Sept. 22, 1872.—Learners C. S. and G. appointed 6th Class Clerks.

Oct. 9.—I——playing at marbles in the street while on duty. Wrote his father.

Further entries read: "Mr. C. allowed off at 3 p.m. to enable him to take certain medicines!"

"Queen's Speech containing 811 words received on two sounders by C. and N.: begun 2.13 p.m., finished 2.24 p.m."

Quite a lot of space in the book is occupied by notes of sick absences, ascribed to bilious attacks, and the staffs at that period must have been particularly "liverish!" Before leaving this interesting old record, we will give one more extract:

May 19, 1873.—"Mr. C. not arrived at 10 a.m. and no information of his whereabouts. Sent up to his house at 11 a.m. but not at home (?). Soon afterwards word came that he was ill and could not attend."

Being referred to as Mr. C. he was presumably above the 6th Class, and could perhaps conveniently take a day off without difficulty, as there is no further entry of any enquiry into the matter

MISSING.

A young telegraphist, very able and steady, unfortunately failed to pass the medical examination for appointment. He left home one morning, taking his latch-key as usual, but was never heard of afterwards. Years later, he became heir to some property, and an application was made to the Judge at the local County Court to presume death. It was then stated that, although every enquiry had been made, no information regarding the missing heir could be obtained, He had, indeed, completely vanished!

Nothing was ever heard of him again and his fate will probably remain a mystery. Perhaps he went to join his brethren in the United States where, in those days, telegraphists often had almost as nomadic an existence as the gipsies.

A YANKEE OPERATOR.

Writing in the American *Saturday Evening Post* recently, an old-time telegraphist said that there was no section in that country where he had not worked. This same operator told some very interesting experiences. On one occasion when a small messenger boy, he was called to an old New York tenement occupied by foreign Jews, and taken into a room in which rested the body of a member of the family who had just died. The little fellow was naturally terrified and tried to leave, but the head of the family insisted that it was his duty to remain, and finally offered him five dollars to stay. The boy sat by the corpse until the morning and says that he earned every cent. of his money! Later on, when an operator, he was out west in charge of a small office during a time of strikes and considerable disorders. One night a rough-looking man, with a revolver in each hand, entered his cabin and asked him to "do him a favour!" The visitor proved to be a reporter and the "favour" was to send a long Press report, but this was contrary to rule, the office being owned and operated by the railway for railway business only. It is perhaps unnecessary to mention that the Press message was despatched without a great deal of discussion regarding the regulations. Later on, our hero was suspended for two weeks for going to sleep on duty (he worked 14 hours a day) so he searched out the reporter whom he had befriended, and this gentleman was able to obtain a post for him in a commercial office.

SOME SPEED!

Readers will not be surprised to learn that America claims the record for the fastest reception by sound. James Francis Leonard, champion telegraphist, was born at Frankfort, Kentucky, in 1834, and it is claimed for him that in the summer of 1848 he received by sound at the rate of 55 words per minute (writing the messages down, of course), a record which has probably never been beaten. The sender on this occasion was Joseph Fisher at Nashville, Tennessee, and the feat is said to be established beyond a doubt. The fame of Leonard spread far and wide, and it is stated that the showman Barnum wanted him to join his world-renowned "show." It is asserted that this expert could read a message as it was signalled from a distant office, while transmitting another, and afterwards write down the telegram so received. This accomplishment is vouched for by several well-known Americans. It is interesting to note than in 1885 the American telegraphists raised funds and erected a monument at Frankfort, Kentucky, to the memory of this grand "old timer."

A RELIABLE ALARM.

Before leaving the Americans, perhaps readers will be interested to hear of the unfortunate night operator at a little railway office, whose duty it was to signal the passing trains. It was the custom for the operators before going to sleep (an irregular proceeding) to tie a string across the track from a telegraph post, pass it through the key-hole in the door, and fix it to a piece of wood placed on the table; the train, catching the string, pulling the wood on to the floor and thus making sufficient noise to arouse the heavy sleeper. On one occasion, the operator came on duty at 8 p.m., very tired, and proceeded to fix up the alarm. He could not find the string and so used a stout piece of bell-cord, fastening the end to the leg of his chair. He soon fell asleep, but was aroused later by being violently thrown to the ground, fearful crashes following. To his horror, he found the room partly wrecked, whilst the chair had completely disappeared. The cord had proved stout indeed, for the chair had been wrenched clean through the glass door by the passing train.

In due course the operator sent an elaborate report to his superintendent, detailing how a mad bull pursued him to the office and how he had heroically beaten the animal off. Alas, the superintendent knew something of the ways of operators—probably he had worked the string alarm himself years before—and the ingenious young man was "fired."

TELEGRAPHISTS' ACHIEVEMENTS.

Readers who are not telegraphists must kindly pardon us if we now sound our trumpet rather loudly, for we are proud to remember the achievements of some of our colleagues. More than one engineer-in-chief to the Post Office commenced as a dispenser of dots and dashes. The marvellous career of a former telegraphist, Major E. A. Sturman, C.B.E., Postmaster-General of the Union of South Africa, has already been outlined in the TELEGRAPH AND TELEPHONE JOURNAL. Edison was once a telegraph messenger and later an operator, and so was Andrew Carnegie. Many other American telegraphists who forsook their early calling went into business and prospered, some even joining the select body of millionaires.

It is a fact that all our national intelligence is not confined to those wonderful men who so conscientiously "mould" public opinion through the daily Press, and edit the weekly comic papers in their spare time. The Post Office can surely claim a little of the "brains," especially if these be measured by the quality of the "reasoned opinion" poured out to order daily in the newspapers, like so much rain water running off a roof!

Many plodding students in the service have employed their leisure to advantage, and we have heard of a sorting clerk and telegraphist becoming LL.D., at an Irish University. Others have graduated in Arts or taken diplomas in music. Numbers are accomplished musicians and are organists and choirmasters at various churches. Some interest themselves in literature, art and science, and it is on record that at least one former telegraphist is a Fellow of the Royal Astronomical Society. And so we could go on and fill up more valuable space than is desirable. Before leaving the subject of

Digitized by Google

telegraphists' achievements, perhaps we may be permitted to recall with pride that the present distinguished Controller of the Central Telegraph Office, Mr. John Lee, M.A., B.Com., had first-hand experience of the wonderful organisation he now so ably directs, and that he, too, was once a telegraphist,

THEN.

Yes, the service has had, and still possesses its romance. In the early days of the telegraph its first use in connexion with a case of murder led to the arrest of the criminal, and aroused considerable interest. Mr. Jermy, the Recorder of Norwich and Yarmouth, and his son, were brutally done to death by a man named Rush in 1848. The local telegraphist, Mr. Ellis Kerry, was roused from bed to send the telegram announcing the fact to the Chief Constable of Norwich, and the culprit was promptly apprehended. Rush, by the way, was a particularly callous murderer, and when his trial was over, remarked: "Give me my slippers and *The Times* newspaper."

Years afterwards, another sensational arrest of a murderer was effected by the aid of telegraphy—wireless this time—when the disguised Dr. Crippen, fleeing from justice, was brought to bay in mid-ocean.

And did we not read in the daily Press but a few days ago that several rebels rushed into the Central Telegraph Office, Dublin, and presenting revolvers at the men on duty, ordered them to put up their hands. The miscreants then attempted to destroy the apparatus, and left after sprinkling petrol on the floors and igniting it. Romantic, but decidedly unpleasant!

For many years all important news matter was telegraphed, special staffs of telegraphists often travelling to the town or villages where leading politicians made speeches, or where events of public interest were taking place. It was rather an enjoyable life for the men on the whole, but frequently the work was extremely heavy, and its prompt despatch was only made possible by the well-known *esprit de corps* of the officers of the telegraph service.

Of course, it is only natural that some mistakes should occur in handling large quantities of Press work. Mr. Albert M. Hyamson quotes two amusing instances in his interesting book, *The Humour of the Post Office*. In the course of an important speech the late Mr. Gladstone once said, referring to a member of the House, "Such is the modesty of my noble friend that he shakes his head." The last four words of the sentence were, however, telegraphed as "he shaves his head," and a leading Birmingham paper actually printed it thus. Mr. W. E. Foster, when making a speech on education, had to use the word "children" frequently, and the telegraphist tiring of the continual use of the word, substituted "kids" in one instance, thinking that his colleague at the other end of the wire would put matters right. Alas, the word "kids" was duly written as signalled, the sub-editor overlooked it, and it actually appeared in the columns of *The Times* on the following day.

It sometimes happened that members of the special staff had lively times. On the occasion of the 5th of November celebrations at Lewes 50 years ago, a Brighton telegraphist was sent to the Lewes Post Office to despatch Press telegrams to London. The crowd, observing his labours, commenced bombarding him with fireworks, with the result that half his time was spent in quenching the fires caused by the mob!

AND NOW.

Are the days of the telegraph as an instrument of public utility over? Emphatically no! As we pointed out in a previous article, the great majority of people in this country, in all probability, can never afford the luxury of a telephone installation, and they must, therefore, rely upon the telegraph for the transmission of their urgent messages. The business man, too, often wants something more tangible than a few words spoken over the "'phone," for *verba volant, scripta manent*. This being the case, and the necessity admitted, telegraph men look with something akin to envy at their fortunate brethren in the sister branch enjoying such improved "lines of communication," and a "no delay" service as make their mouths water. They are also aiming at what is, practically, a "no delay" service, for there is no efficiency without promptness, and the purpose of a telegram is usually defeated if it is delayed. This happy consummation, we suggest, is within reach if spare lines are alloted to provincial telegraph offices in the manner indicated later on.

THE CENTRAL TELEGRAPH OFFICE.

The editors of this JOURNAL welcome honest criticism, and will perhaps not be offended if we touch on a delicate subject—the Central Telegraph Office. We are all proud of TS and its wonderful record, but the majority of telegraph men—outside the C.T.O.—are at least agreed on one subject, and that is, that the largest telegraph office in the world has outgrown its strength. As the elephant cannot compete with the horse in the matter of agility, so this great institution cannot adequately respond to the calls daily made upon its vitality and resources, and overcome the inertia inseparable from its size. In a few words, it is too large—much too large—to consistently and efficiently handle the vast amount of traffic poured into it daily for transmission, by the thousand and one offices with which it is now in direct communication. Its very proportions prohibit anything approaching the speed of message transit, circulation and despatch attained at smaller offices.

The reader may naturally ask what remedy is proposed, assuming, quite properly, that the writer in a respectable journal would not entertain any idea involving bombs and arson!

Our suggestion, briefly, is this. Do not allow this wonderful institution to grow any larger, and reduce its "food supply" wherever possible, always remembering its heavy "overhead" charges and costly site. Extend the admirable Zone System, and give the larger offices the use of the spare wires, now lying idle as the result of the extension of machine telegraphy, for intercommunication purposes. This will obviate thousands of expensive transactions in the C.T.O. daily, and will be a good step towards every telegraph man's goal—the "no delay" service.

CONCLUSION.

Telegraph men throughout the country offer their respectful and sincere congratulations to Mr. R. A. Dalzell, C.B.E., on his appointment to the post of Director of Telegraphs and Telephones. They are gratified and much encouraged to read his kindly message of greeting in the TELEGRAPH AND TELEPHONE JOURNAL, and beg to assure him of their loyal support in every effort made to maintain the highest traditions of the finest telegraph service in the world.

HOW THE TELEPHONE WORKS.

BY A. CROTCH.

I.

WE shall attempt in these short articles to show, in simple language, how the speech uttered before a telephone is reproduced at a distance in a listener's ear before another telephone, the two instruments being some miles apart. As a preliminary, however, it is necessary to consider a few elementary facts of the sciences of magnetism and electricity in order to appreciate the functions of the various component parts of the telephone.

Magnetism.—The peculiar property of a magnet is that its ends have a great attraction for iron or steel; dipped in a quantity of iron tacks or filings, for instance, and then raised, a magnet will bring up a cluster sticking all round its ends. The magnet itself is a simple slip or bar of hard steel, properly magnetised, either kept straight, as a "bar-magnet," or bent round to the familiar horse-shoe shape. In the first case the ends are as far apart as is possible, in the second they are relatively close together. Each end of a bar-magnet, in turn, and the pair of the horse-shoe magnet, have the same effect on the filings, but there is a subtle difference between the two ends. To distinguish one end from the other, one is generally stamped N or otherwise marked. This is the marked end or N pole and the other the unmarked end or corresponding S pole. If we hold two horseshoe magnets of approximately the same strength near each other, the N pole of one facing the S pole of the other, but separated by half-an-inch or so, a powerful pull will be felt, and if allowed to do so the magnets will move towards each other, come in contact and stick to each other with great tenacity. If, however, we reverse one of them, so that the N pole faces the N pole of the other (and similarly with the other two poles), a new effect is manifest. Not only has the attractive force ceased between them but it has been reversed, and if the two magnets are free to move, they will push each other apart. Similar effects can be seen with a pair or more bar-magnets; the marked end of one will attract the unmarked end of another, but the marked end will repel all other marked ends, and an unmarked all unmarked ones. This is conveniently summed up in the textbooks as "unlike poles attract, like poles repel, each other."

But between either pole and soft iron we invariably get attraction only, never repulsion. The reason is as follows: As soon as a magnet approaches a piece of soft iron the latter becomes magnetised. As soon as the magnet is removed the iron loses its magnetism. This effect is termed "induction," and the iron so acted on becomes an induced magnet, entire and complete, with an N and an S pole. The best way to see this is to use a bar-magnet and a smaller bar of iron. When the N pole of the magnet is brought near the iron (not touching) an S pole will be produced at the near end and an N at the far end of the latter. Two unlike poles thus facing each other, attraction follows. When the magnet is removed, the iron reverts to its original state. If now the S magnet pole

Digitized by Google

be brought near the bar the latter will again be magnetised, but in an opposite sense, *i.e.*, an N pole will be formed at the near end and an S at the far end. Two unlike poles therefore again face each other and attraction ensues. Hence the reason for the constant attraction of iron by either pole is that opposite polarity is always set up by the inducing magnet.

If we use a small bar of very hard steel instead of soft iron, it is but little affected by the presence of a magnet. That is, it will not respond, except in a very slight degree. But whatever effect has been produced will remain when the magnet has been removed. By suitably stroking or rubbing the steel with a magnet the bar can be magnetised, and this magnetism will remain and the steel will become, in its degree, a magnet.

Magnetism is inherent in iron and steel. The softest iron responds at once to a magnetising force, but immediately returns to its inert state when that force is removed. That is, the magnetic effects are temporary. To evoke the magnetism of hard steel is difficult, but once evoked, it remains. For making permanent magnets, then, the hardest steel is used, but for temporary ones the softest iron.

Electro-Magnetism.—Whenever an electric current flows, magnetism is always set up. Perhaps the simplest manifestation of this is to wind a length of, say, copper wire round a soft iron bar. The wire must of course be covered with enamel, silk or other insulating material to prevent metallic contact between the turns. When a current of suitable strength is passed through the wire, the bar becomes a magnet, one end an N and the other an S pole. If the direction of the current be reversed, the polarity will likewise be reversed, and when the current is cut off, the magnetism disappears. This constitutes an electro-magnet. A simple illustration of this is seen in the ordinary electric (trembler) bell. Here we have an electro-magnet consisting of two cylindrical soft iron "cores," surrounded with insulated wire. At one end the cores are connected together by a yoke of soft iron, together forming a horseshoe electro-magnet. A soft iron armature is hinged over the free ends (poles) of the electro-magnet and is normally kept off them and against a contact screw by means of a spring. When the circuit is completed by the depression of the press button, the current flows through the coils, magnetising the cores and attracting the armature. This movement of the armature breaks the circuit at the contact screw, the magnetism dies out of the cores and the armature, ceasing to be attracted, returns to the contact screw, re-establishing the circuit, when the cycle is gone through again.

Electricity.—One of the most familiar sources of electricity is the common Leclanché battery of one or more cells. A plate of carbon is placed in a cylinder of unglazed earthenware (the "porous

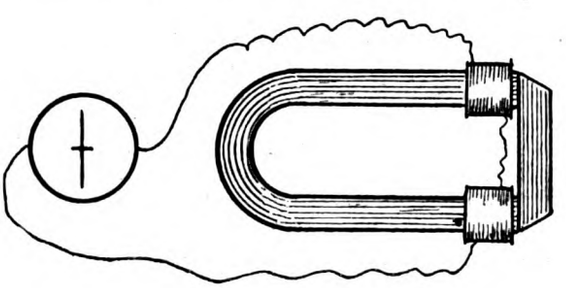

FIG. 1.

pot") and surrounded with broken carbon and manganese dioxide—in recent practice these two materials are reduced to powder and well rammed down in the pot. Outside the pot a cylinder or rod of zinc stands in a solution of sal-ammoniac, and the whole enclosed in a glass or stoneware jar. A brass screw on the carbon and the bare end of the connecting wire on the zinc form the terminals of the cell, and when these are joined together by a conducting wire chemical action is set up, the sal-ammoniac eats away the zinc and hydrogen is set free at the carbon plate. The manganese dioxide is rich in oxygen and this engages with the hydrogen, forming water. This chemical action causes a current of electricity to pass through the wire which connects together the terminals of the cell.

The dry cell now in such common use is practically a Leclanché—having the materials of the cell made up in a moist paste instead of liquid form.

When the terminals of the cell are connected together by conducting wire there is set up a "circuit," round which the current flows. The latter is assumed to pass from the terminal on the carbon, round the circuit, and back to the zinc terminal. In practice the circuit consists of the coils of instruments, the line wire, &c., and this must be complete before the current can pass. If it is severed, even by the slightest break, the current ceases.

The current passing through the circuit will be large or small as the path open to it gives greater or smaller facilities. That is, if we use a copper wire, six inches long, the current will be greater than if we use a similar copper wire a thousand yards long. The current will have greater difficulty in "getting through" the long

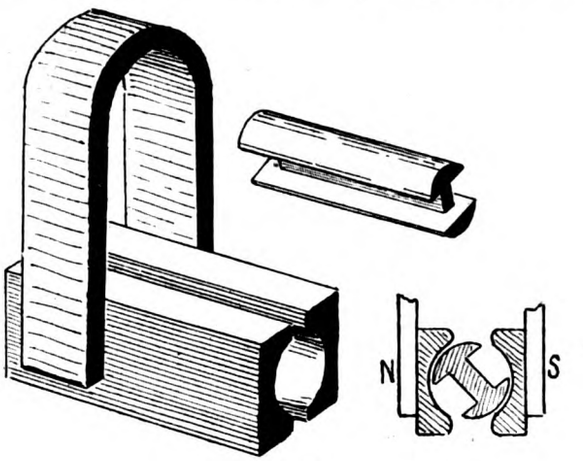

FIG. 2.

wire than through the short. In text book language we say that the "resistance" of the short wire is less than that of the long. We speak of the metals as good conductors; this means that their resistance is very low. Also of silk, gutta percha, &c., as good insulators: in other words their resistance is exceedingly high.

Magneto-Electricity.—We have seen that magnetism can be produced by electricity—by passing an electric current through a coil of wire wound over a soft iron bar. The converse is also true, that electricity can be produced by means of magnets. Imagine a horseshoe permanent magnet, with its keeper or armature lying across the poles. The lines-of-force of the magnet pass from one pole to the other through the mass of the keeper. If we pull the keeper off, the lines have to pass through the air in the journey from pole to pole. In taking off the keeper and putting it on we cause a rearrangement, a fresh distribution of the lines, and this rearrangement, under suitable conditions, will set up short, momentary currents. Imagine a coil of fine insulated wire to be wound over each of the poles and connected up to a suitable galvanometer, as in Fig. 1. If the keeper be wrenched off quickly—the sharper the better—the lines-of-force, in rearranging themselves, "cut" the wires of the coils and a momentary "flick" of current passes through the circuit thus set up. On sharply replacing the keeper, the lines are again disturbed, and another flick of current traverses the circuit in the opposite direction to the first, as will be seen by the deflection of the galvanometer. In small "medical" machines an armature is revolved across the pole pieces of a permanent magnet thus furnished with coils and this sets up a stream of momentary currents in alternate directions.

The principle, thus illustrated, of magneto-electricity, or the production of electricity by means of magnets, is of great importance.

Digitized by Google

The generator, so universally employed in "ringing up" is based on this principle, as indicated in Fig. 2. Two long pole-pieces of soft iron form a kind of tunnel and on their outer surfaces several

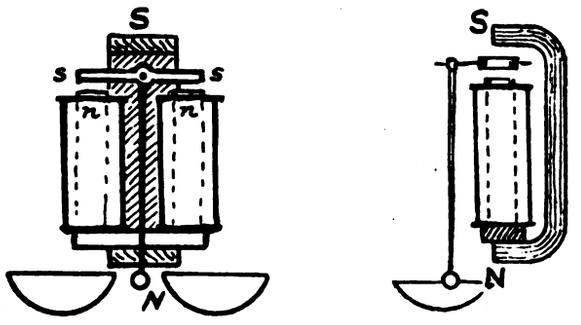

FIG. 3.

permanent magnets are fixed (one only of which is shown) so that between the inner faces of the incomplete tunnel there is a strong magnetic field. Running in this is the well-known shuttle armature, which would be a solid cylinder but for the deep channel cut quite round it. In this channel the wire is wound and the ends brought out by suitable means. When the armature is lying across the field —the position it naturally takes up when left to itself—it may be regarded as equivalent to a magnet with keeper *on*; when at right angles to this, as having the keeper *off*. Any change results in a redistribution of the lines of force and the generation of a momentary current or impulse.

The bell rung by these alternating currents is a polarised one, its general arrangement being as shown in Fig. 3. A permanent magnet is so placed that one pole is fastened to the yoke of the electro-magnet, thus making both poles of the latter N poles. The other end is near the centre of the armature thus inducing S polarity in both its ends. When a pulsation of current in one direction passes through the coils the existing polarity of one pole of the electro-magnet is increased in strength while the other is diminished or reversed and the armature moves in one direction. The next impulse being in the opposite direction, opposite polarity is produced and the movement of the armature is reversed. The trembler bell previously referred to is a non-polarised instrument, it being quite immaterial what polarity is developed by the current. Any reversal of the latter results in the attraction of the armature as before.

(To be continued.)

PROGRESS OF THE TELEPHONE AND TELEGRAPH SYSTEMS.

TELEPHONES.

THE number of telephone stations, exchange and private, on the Post Office system at July 31, 1922, was 994,103 (these figures, of course, exclude the 19,000 telephones transferred to the Irish Free State), the number of stations added during July being 3,362 (net). These stations were connected with 3,083 exchanges and there were in addition 30 purely Trunk Exchanges. The number of public call offices in use at the end of July was 15,667, the rate of growth being nearly 100 a month. Considerable progress is being made with the construction of street kiosks, the total number now installed being 317 as compared with 227 in March last year. The use of rural party lines is extending rapidly, the total number of subscribers at the end of July being 4,671 or nearly double the number connected a year ago.

The local traffic (calling rate) during the first four months of the current financial year has been practically the same as during the corresponding period of last year, and the latest returns show no sign of an immediate improvement. The London figures by themselves show a slight increase and the Provinces a decrease.

The use of the Trunk system steadily but slowly increased between December and May last when the number of calls made reached high-water mark since the new charges came into force. Since then the traffic has fallen off slightly. The reduced charges for afternoon calls which came into operation on July 1 do not appear to have affected the number of calls made or the incidence of the traffic to any appreciable extent at present.

Since April 1 of this year considerable progress has been made in development of the local exchange system. Among the more important new exchanges opened are the following:—

London Area.—Maryland (Stratford), Tottenham, Sidcup, Wembley, Barnet, Maida Vale (Kilburn).

Provinces.—Giffnock (Glasgow), Falkirk, Cambuslang, Canterbury, Fleetwood (Automatic), Dunfermline.

The following important exchanges have been extended:—

London Area.—Streatham, Bromley, East Ham, Walthamstow, East, Richmond, Romford, Hop, Ilford.

Provinces.—Glasgow Central, Blackpool, Stockport, Nottingham, Birmingham, Victoria.

Considerable additions to the main underground Trunk system have been completed and brought into use as follows:—

Underground cable between London and Manchester.
" " " Cardiff and Port Talbot.
" " " Widnes and Runcorn.
" " " Preston and Blackpool.
" " " Paisley and Greenock.
" " " Hunton Bridge and Berkhamsted.
" " " London and Watford.
" " " London, Colchester and Ipswich.
" " " London, Hatfield and Welwyn.

Submarine cable between England and Holland, affording communication between London, The Hague, Amsterdam, and Rotterdam.

In addition to the foregoing, 41 new overhead Trunk circuits have been completed and brought into use during the current financial year.

TELEGRAPHS.

The telegraph traffic during the three months ended June 30 last amounted to 18,733,000 messages as compared with 18,837,000 messages during the corresponding period last year. Last year's figures, however, include the traffic in that part of Ireland which has since become the Irish Free State. No particulars are available to show the precise amount of this traffic, but, if reasonable allowance is made for it, there is evidence of a satisfactory increase in the traffic in Great Britain and Northern Ireland as compared with last year.

Noteworthy progress has been made recently with "Baudot" working, the following inland circuits having been equipped for Baudot working since January, 1922:—

Circuits.

1. London to Southend.
2. Liverpool to Blackpool.
3. Liverpool to Belfast.
4. London to Bradford (shortly to be extended to Newcastle-on-Tyne).
5. Liverpool to Douglas (Isle of Man).
6. Hastings—London—Tunbridge Wells.
7. Glasgow to Belfast.
8. London to Eastbourne.
9. London—Exeter—Plymouth.

Prior to the Hastings—London—Tunbridge Wells installation (item 6) the Manchester—Leeds—Newcastle-on-Tyne route was the only route equipped for "divided" Baudot working. Considerable development is anticipated in this method of working.

There are now 49 Inland Baudot circuits and 40 of these have been installed since August 1917.

The
Telegraph and Telephone Journal.

PUBLISHED MONTHLY IN THE INTERESTS OF THE TELEGRAPH AND TELEPHONE SERVICE, UNDER THE PATRONAGE OF THE POSTMASTER-GENERAL.

Editing and Organising Committee - - - J. STUART JONES. JOHN LEE. J. J. TYRRELL. W. A. VALENTINE. J. W. WISSENDEN.

Managing Editor - - W. H. GUNSTON.

NOTICES.

As the object of the JOURNAL *is the interchange of information on all subjects affecting the Telegraph and Telephone Service, the Managing Editor will be glad to consider contributions, and all communications together with photographs, diagrams, or other illustrations, should be addressed to him at G.P.O. North, London, E.C.*1. *The Managing Editor will not be responsible for any manuscripts which he finds himself unable to use, but he will take the utmost care to return such manuscripts as promptly as possible. Photographs illustrating accepted articles will be returned if desired.*

VOL. IX. OCTOBER, 1922. No. 91.

THE TELEGRAPH ZONE SYSTEM.

AN agricultural expert asked by the United States Government to give a report on the harvest in Eastern Europe has declared that owing to the break up of the large estates into small farms there has been a notable decline in the use of agricultural machinery. This has affected the efficiency of the harvest as a whole, but it is to be remembered, says the expert, that the remunerative use of costly machinery cannot be secured on a small scale. We are reminded of this report by reading Mr. Skinner's admirable article which appears in this issue. We do not set out to controvert that article, but there are some points which we can put in rather a different light. At the outset the whole telegraph position in this country is changed by the fact that eight channels, and in some cases ten and even twelve channels, each of them much more productive than the simple single Morse channel, can be equipped on one wire. In earlier days with uniform Morse working it always seemed to be sound to perform transmissions at the smallest offices possible. The Morse operation at the small office corresponded closely to the Morse operation at the large office, and as the various costs were less it was more economic to have many cross-country wires and to perform the act of transmission at the smaller office. With the newer machines the whole outlook has changed. The transmission of telegrams at intermediate points, so far as plant is concerned, becomes a by-product and it fits in with the traffic strictly appropriate to a heavy route, in itself insufficient to fill one of these great multiplexes. Thus as regards plant at any rate the advantage is obvious. As regards the labour of transmission, without going into very precise figures, it is equally obvious that the output is so much more than Morse that the cost of individual transmission is very perceptibly reduced. It is on this basis that the zone system finds its place. There is less necessity for many routes; there is less necessity for cross-country routes. Wires which in themselves carry less than the potential load of a full Multiplex are difficult to justify.

And then there is the question of London. It should always be remembered that London is the capital of this country in an inclusive sense which applies to no other capital. It is the legal, the legislative, the shipping, the engineering, the commercial, the financial, the social, the literary and the artistic capital of the whole country. If there are large Multiplexes anywhere they will have to be to London. Whether we like it or not, of its essence the telegraph system will be a radial system having London as its centre. Other countries have attempted by strictly legal means to prevent this state of affairs from happening. Washington was founded with the direct object of preventing the financial capital from also being the legislative capital; we apprehend that Boston would regard itself as the literary and artistic capital; that Chicago would pride itself on being the food-stuff capital; that Detroit has its own claims as regards motor cars. The centralisation of Paris, just as we write, is the subject of grave concern to some economic writers in France who are urging that a deliberate policy should be adopted under a guise of local government to encourage Marseilles on the one hand, and Lille on the other hand, to have local powers for the development of their predominant characteristics. The arguments as regards a capital for Australia will be fresh in all people's minds. Coming back to London we are face to face with an accomplished fact. Having in mind the narrower realm of telegraphs let us say that the amount of transmitted traffic in London after all is but a small proportion of the traffic which is to and from London itself. As far as we are aware, therefore, there is no intention whatever of inflating the Central Telegraph Office. Mr. Skinner is unnecessarily anxious and he must not think for a moment that his criticism is resented. He does well in urging arguments from his own point of view, for it is only by that means that ultimate wisdom can be assured.

Someday the inter-connexion of channels of multiplexes to provide direct transit will change the problem again. When that day comes it must find us all equally as open-minded to change, for it will resolve itself into an issue between the extension of multiplex channels, with the consequent narrowing of the range of the remaining multiplex channels on the one hand and transmission at a distant point on the other hand, and it may be that present policies will be modified. There is always a subtle misunderstanding ready to assail us. It is to mistake improvement for finality. The truth is that we have to make the very best of the possibilities of science as they have been given to us, always keeping ourselves ready for still further advances. A no-delay service is a healthy ideal, but some of us, while yielding to no one in a desire for promptness, are not disposed to forget that if we can do something to make the telegraph service in the eyes of England more nearly remunerative we are conferring the best of all favours on the telegraph service of the present and future.

HIC ET UBIQUE.

THE total number of telephones in the British Isles is at present (July 31) 1,029,500. At the beginning of this year the United States had 13,975,000 telephones, Germany 1,948,624, and Great Britain and Ireland 997,805. Canada would come next on the list, but figures are not yet available, followed by France with 488,818 and Sweden with 387,337. These are the six largest telephone systems in the world. Amongst cities, New York had 979,534 telephones, Chicago 605,495, Greater Berlin 347,735, the London Telephone area 345,797, Boston 313,295, Philadelphia 233,122 (Bell system only), and Paris 173,000; then follow San Francisco, Los Angeles, Detroit and Cleveland each with over 150,000 telephones.

IN May last Lady Ozanne opened a new switchboard at St. Sampsons, Guernsey, the second largest exchange in the island. At that time the States system comprised 2,816 telephones or one to every 13.2 people, and to every 6.4 males. It is hoped to reach a figure of 3,000 stations by the end of the year.

THE Exchange Telegraph states that the telephone tariff in Copenhagen is being reduced by about 10 per cent., from 150 kroner to 136 kroner per annum for 1,000 calls, and 300 kroner to 270 kroner for the unlimited service. In the provincial towns of Zealand the charge is reduced from 100 kroner to 90, and in rural areas from 90 to 70 kroner. Distance charges are also reduced proportionately. We presume that by "unlimited service" is intended the rate including 5,500 free outward calls.

WE have received the report of the Posts and Telegraphs Department of the Federated Malay States for 1921, showing that there were 2,389 miles of telegraph and telephone line at that date, and 16,369 miles of wire. There were 2,898 telephones, including extensions.

FROM an American journal:

"As a result of caring for the 500,000 pound 40-year bond issue of the Jutland Telephone Co., English interests are slated to get the first crack at the equipment needs of the Jutland company, for which the bond money is to be spent."

We don't care for the English of the above, but if any reader gets first crack at an accurate translation, we shan't slate him.

THE TELEPHONE AND TELEGRAPH SOCIETY OF LONDON.

PROGRAMME, 1922-23.

THE meetings will be held at the Institute of Electrical Engineers, Victoria Embankment, and the following papers will be read:—

Date.	*Subject.*
Oct. 16, 1922.—	"Some Remarks on Technique," by Sir Henry Bunbury, K.C.B.
Nov. 20, 1922.—	"Whitleyism and Control," by Mr. J. W. Bowen.
Dec. 18, 1922.—	"The Anglo-Continental Telegraph Service since the War," by Mr. J. J. Tyrrell.
Jan. 15, 1923.—	"Some Aspects of the Communication Act," by Mr. F. Gill.
Feb. 19, 1923.—	"The Great Slump in Prices: its causes, its course and its limits," by Mr. G. F. Mansbridge.
Mar. 19, 1923.—	"Studies in Financial Administration," by Mr. F. C. Cook.
April 16, 1923.—	"Progress in Wireless," by Mr. S. E. J. Burrow.

The meetings commence at 5.30 p.m.

TELEGRAPHIC MEMORABILIA.

THE C.T.O. has again been favoured with a visit from yet another foreign delegation in the persons of the highly-placed body appointed by the Italian Telegraph Administration to examine the various wireless and submarine cable systems as mentioned in this column last month. The delegation was headed by *Direttore* Angelini and was represented by both administrative and technical experts. All were much interested in the many evidences of good orgnisation and the desire to test-out the most modern telegraph inventions available. One is so used to the constant adverse criticism of our compatriots, who fear to flatter lest we should slacken in endeavour, that it comes as a refresher to listen to the kindly comments of distinguished colleagues from abroad who visit us from time to time. Making due allowance for the usual international courtesies on such occasions, it is gratifying to find that there is still a genuine admiration of the British telegraph system. The writer has recently had the good fortune to come into very close contact with expert representatives from three continental countries. The members of all three spontaneously expressed the freedom with which every item that could possibly help or instruct was laid before them, and the pains taken to give exact data. Two of these delegations specially remarked on the "magnificent organisation," both used the same term, and both emphasised the impression which a prolonged stay in the C.T.O. had made upon them, that, "everything moves and works smoothly without excitement!"

Coming on top of these tributes has recently arrived the crowning glory in a most generous appreciation of the work of the C.T.O., and Leafield Wireless by certain American newspaper proprietors, who, through their secretary, have brought blushes to the cheeks of all concerned by their praise of the C.T.O.—Leafield—Halifax radio service. We cannot, however, accept the whole of this welcome appreciation without reverting to the excellent co-operation received from the Canadian side day after day, without which our utmost efforts would be of no avail.

It appears that I have omitted to make any mention of the establishment, some time ago of the wireless communication between Norway and the United States. The radio post in the former country is at Stavanger and that in the latter is situated near New York. Both posts have been erected by the Radio Corporation of New York.

The same Corporation has also received the contract from the Swedish Telegraph Board for the delivery of wireless equipment for a large station to be erected on the West Coast of Sweden. The *Daily Telegraph* adds to the above information, furnished by Reuter's agency, the interesting detail that one transmitting and one receiving station is to be erected, the former at some point between Varberg and Falkenberg and the latter near Kungsbacka. They are to be finished during next year. It is apparently expected that the rates will be considerably lower than the present charges *via* Norway.

According to the *Financial Times* the Portuguese Government has or is about to sign a contract with the Marconi Company for the exclusive right to establish wireless stations in Lisbon, Madeira, the Portuguese African Colonies and the Azores for a period of 40 years.

The following paragraph lifted in its entirety from the *Electrical Review* on "International Progress in *Wireless Telegraphy*" signalises the wireless international developments of the last thirteen years:—

> "The progress of international wireless telegraphy is shown by the fact that, since June, 1908, the date of the formation of the Union Radiotélégraphique, the number of shore stations has risen from 76 to 977, and other stations from 246 to 12,622. All the countries of the world are now signatories of the Union Convention save Argentina, Persia, and Turkey. Among the signatories are Czecho-Slovakia and Venezuela (in 1920), Serbia, Croatia and Slovakia (in 1919), the Republics of Ecuador and China (in 1920), and Poland and Dantzig (in 1921). Albania has this year announced its adherence."

On the recent occasion when at a joint meeting of the Institute of Radio Engineers and the New York section of the A.I.E.E., Senatore Marconi was presented with the Medal of Honour of the first-named society as "a pioneer of pre-eminent standing in the radio field," the well-known inventor gave a paper on "Radio Telegraphy," from which the following is culled from among many other interesting items and will doubtless interest many of our readers. The results obtained at receiving observation points situated in various parts of the world far distant show that it has been ascertained that "radio signals arriving from high-power stations situated at or near the antipodes of the observation stations, reach the receivers by various ways around the earth, not always following the shortest great circle route, and also that at such places the electric waves coming round by different ways do in certain cases increase this effect on the receivers whilst in others interfere with each other. Apparently transmission is easier from west to east than from east to west, and it may be necessary to modify somewhat the transmission formula for long distances. It has also been ascertained that the most troublesome atmospheric disturbances or static usually come from the continents, and not from the oceans."

Direct wireless communication between France and New York was established at midnight on Aug. 6 by means of the wireless station at Saint-Assise. The new station is situated near Melun, not far from the Forest of Fontainebleau. The installation is 50 per cent. more powerful than that of Bordeaux. Three new sets of apparatus are shortly to be erected at

Digitized by Google

the Saint-Assise station, which will then be four times more powerful than the Bordeaux station and 35 times more powerful than the Eiffel Tower station. This station will in future carry on all wireless communication between France and America, and is worked from Paris by means of the long-distance control system. Direct communication has already been established with Argentina and China. Another development of wireless telegraphy in France is the inauguration of direct communication between Bordeaux and Saigon, with a tariff over 2 fr. a word cheaper than the ordinary cable rates. The next step is to be the equipment of six colonial stations for transmission, which at present can only *receive* messages, at Martinique, Guinea, Rufisque, in West Africa, Djibouti, in East Africa, Brazzaville, in Equatorial Africa, and Tananarivo, in Meridional Africa. This work completed, it is proposed to construct, probably in 1926, two stations in the Pacific, which will complete the chain of communication linking up France and her colonies.

The *Shanghai British Chamber of Commerce Journal* states that the new wireless station at Liushutun (across the bay to the north of Dairen), the construction of which was commenced last year, was to be opened for public use last month. The total cost has been about £30,000. The installation consists of three steel masts, each 300 feet high. The method of transmission adopted is that of the Tokio Teishinsho (Department of Communications) and consists of a quenched-spark converter of 7 kilowatts, and an arc converter of 35 kilowatts. By using the latter it is stated that it will be possible to converse direct with Europe and the United States. The power is to be supplied by the new South Manchuria Railway Co.'s power house near Dairen, but as this is not quite ready some of the power is being obtained from Chinchow for the time being.

The steam trials of the New German cable steamer *Norderney* were carried out during the month of August at Wilhelmshaven and according to the *Taegliche Rundschau* were quite successful. Her displacement is 2,000 tons, speed 10 knots and her cable-carrying capacity about 1,000 tons. She is of course fitted with wireless apparatus and also apparatus for submarine signalling, and was built to replace one of the cable steamers surrendered to the Allies. It will be seen that the *Norderney* is considerably smaller than the *Stephan*, the German cable ship which laid the Mundesley-Norderney cable in 1913, which was with the exception of the British C.S. *Faraday*, the largest cable steamer in the world. The *Stephan*, named after the first Postmaster-General of Germany, could carry in her four cable-tanks no less than 5,000 tons of submarine cable.

During the month of August an event occurred in the telegraph world which appears to have failed to strike the imagination of Fleet Street reporters. Who would have imagined in 1903 the establishment of telegraphic communication between "The Forbidden City" and India? An ever watchful correspondent of mine *à propos* of the opening of the Lhassa-Simla telegraph circuit reminds us of the message of the Dalai Lama of Tibet to the Younghusband Mission in that year, "We cannot accept letters; we cannot write letters; we cannot let you into our zone." Contrast with this the message of greeting and thanks which the present Lama signalled over this line at its inauguration. The construction was carried out by the staff of the Indian Post Office, the whole distance between Gyangste and Lhassa being completed under two months.

The forecast that the Miami cable dispute showed signs of coming to a satisfactory termination has proved correct. Following on the signing of a decree by President Harding authorising the Western Union Telegraph Co. to operate the Miami-Bahamas cable, which will thus give direct connexion between the Western Telegraph line with the United States, the Western Telegraph Co. on the seventh of last month opened a new direct cable route between Brazil and the U.S.A.

A recapitulation of the history of this two years' controversy may not be out of place. In as condensed a form as possible it is that the Western Telegraph Co, a British company, not to be confused with the Western Union Telegraph Co., held a monopoly of inter-port telegraph communication in Brazil and preferential rights in the Argentine. The all-America Cables, Incorporated, had a monopoly of privileges on the west coast of South America. In 1921 the U.S. Government refused to allow the Western Union Telegraph Co., to land a cable at Miami, Florida, from the Bahamas, on the ground that cable traffic from the United States could be sent by way of the Bahamas and Barbados over the British monopoly cable to South America.

The State Department at Washington then proposed that the monopolies held by the British and American companies on the east and west coasts of South America respectively should be waived, on condition that acquiescence of the South American Governments concerned should be obtained. This was agreed to some time during the month of August, and with commendable promptitude presidential action set its seal thereto.

The Spanish Government have recently laid the following new cables to the Balearic Islands:—

(1) Single conductor, 10 nauts from Punta Salinas, Mallorca, to Cala Gandus, Cabrera Is.

(2) Single conductor, 34 nauts from Plana de Salinas, Ibiza Is., to Playa de la Sabina, Formentera.

The Western Telegraph Co. announces the laying and re-allocation of cables as follows:—

New cables.—Single conductor, 1,792 km. Pernambuco to Maranham. Single conductor, 326 km. Pernambuco to Maceio and a third cable of 377 km. between Santos and Rio de Janeiro.

Re-allocations.—The two old direct cables between Bahia and Rio de Janeiro have been divided, and the four ends landed at Victoria (Brazil), forming Bahia-Victoria (Nos. 1 and 2) and Rio de Janeiro-Victoria (Nos. 1 and 2), giving average lengths on the two respective sections of 946 and 351 kilometres.

As showing the world-wide activities of submarine cable developments, one need only add the following few items to complete this month's story. The Eastern Telegraph Co. proposes to lay submarine cables between Aden and Seychelles Islands and between the Seychelles and Colombo, continuing the connexion by another section from Colombo to Singapore. A sixth cable will also be laid very shortly between Malta and Alexandria and an additional Red Sea cable between Suez-Port Sudan and Aden.

As programmed the All-America Cables has opened a new cable for public traffic between Colon and Port Limon, and the Commercial Cable Co. has acquired the cable between Canso, Nova Scotia, and Port-aux-Basques, Newfoundland.

Hearty congratulations to Mr. Offord upon his appointment as Assistant Controller, C.T.O., and to the various other gentlemen, whose names appeared in the recent C.T.O. lists (Inland and Foreign) under their respective headings of Superintendents (H. and L.), Assistant Superintendents and Overseers.

The New Series of the *Cable Room Monthly* is keeping up the high standard promised in No. 1, and even apart from matters of purely local interest is well worth the money. The historic article, "Lead on Signals!" deserves a wider audience than the C.R.M. could possibly be expected to give.

It is reported that the following worthy pensioners have been seen in or near G.P.O. West, anyway within 12 miles of Charing Cross, and that quite recently, and all looked wonderfully well.

Sir William Slingo, Sir Alexander King, Mr. A. Tapley, Mr. H. Vandermeulen, Mr. McEwan, and Mr. Harry Crofts.

We regret to note that Mr. West, late Superintendent of the Cable Room, passed away about the middle of August after a short illness. It seems only a short time ago that he quitted the Service on pension apparently with every prospect of a lengthy retirement. He will best be remembered by his wonderful vivacity and his keen sense of the humorous. R.I.P.

Although it is something like fifteen years since Mr. H. Blandford, Assistant Superintendent, retired from the Foreign Telegraphs, his many friends will learn with the keenest sympathy for those whom he has left behind, that he too has passed over. Few probably even of those who were intimately acquainted with "Harry," were aware of the stormy and stressful periods of his life, so well did he hide his troubles behind a cheerful disposition. A devoted husband, father and friend, bereavement, sickness and finally, the war wore down even his buoyant nature.

A personal word of regret is due from the writer for failure to detect a misprint in the reproduction of the article on the North Walsham Repeater Office last month where the name of the officer in charge there appeared as Farrow instead of Farrar. Mr. Farrar's name is so well known that there is really no excuse which could legitimately be submitted in my defence.

At the end of July a letter was received from a correspondent in the C.T.O. and has only quite recently been placed in my hands. The signature is not easily decipherable, and is apparently written by a lady. It is in bantering tone but with not the slightest trace of bitterness or unkindliness. Its theme is a comparison of telephone supervisors with telegraph supervisors, and if only for its happy manner of voicing a grievance we should much have liked to publish it *in extenso*, but find that the subject is scarcely within the scope of this JOURNAL'S mission. In these days of journalistic specialisation it is found that trespasses into other preserves are by no means appreciated.

Colour and the Artist.—The finer the eye for colour the less it will require to gratify it intensely. But that little must be supremely good and pure as the finest notes of a great singer which are so near to silence. And a great colourist will make even the absence of colour lovely, as the fading of the perfect voice makes silence sacred.—*Ruskin.*

J. J. T.

ROCHDALE TELEPHONE DISTRICT.

A TENNIS and a bowling tournament for prizes offered by the District Manager, Mr. J. T. Whitelaw, was concluded on Sept. 8, when the District Manager, before a gathering of the whole of the staffs, presented the prizes to the successful competitors.

The tennis tournament was confined to the lady members of the staffs and was won by Miss E. M. Collins of the Trunk Fees Section, her opponent in the final being Miss J. E. Eckersley of the same department. Mr. S. P. Wilson, Contract Office, was successful in the bowling handicap, defeating Mr. R. Cleland of the Accounting Section. The prizes were much appreciated by the recipients and in the course of the proceedings, Mr. Audsley, Traffic Superintendent, spoke of the beneficial results accruing to the staff by this friendly rivalry in games.

LONDON ENGINEERING DISTRICT NOTES.

New Cable to Watford.

THE completion has just been effected of a new cable connecting Watford to the Toll and Trunk Exchanges. The cable contains 160 pairs of wires, each wire weighing 40 lbs. per mile. The cable has loading coils inserted at intervals of 1.6 miles, the added inductance amounting to 175 millihenries per mile. Every pair of wires has been carefully balanced for electro-static capacity against other pairs, and there should be a minimum of cross-talk on the physical and superposed circuits The whole of the work of cabling, jointing and balancing and testing was carried out by the London District staff.

Barnet New Exchange.

On Aug. 31 a new exchange of the C.B. No. 1 type was opened at Barnet in replacement of a board of the No. 9 type which existed on the same site. In order to accommodate the new exchange it was necessary to enlarge the building. The new exchange has a multiple capacity of 1,700, and is equipped for 1,600 lines.

At the transfer the number of working subscribers' lines was 798 and the junctions numbered 118.

New Wembley Exchange.

The new Wembley Exchange was opened on Aug. 16, with 285 lines and 95 junctions. The exchange is situated in a new building which has been specially constructed for the purpose in the telephone centre of Wembley. Before the opening of the new exchange the subscribers had been accommodated on a suite of sections in the Willesden Exchange, and the cable plant, which had been provided between Wembley and Willesden was used to its full capacity for the purpose of giving service to subscribers. As this plant was required to provide junctions for the new exchange, considerable ingenuity and careful arrangement was required on the part of the external and internal engineers to ensure that a continuous service should be provided during the period of transfer.

The equipment consists of :—

7 "A" positions.
3 jack-ended junction positions.
3 plug-ended junction positions.
1 testing operator's position.
1,200 multipled jacks.
1,100 local jacks.

together with the usual accessories.

The exchange was opened quite free from faults.

Maida Vale Exchange.

This exchange which was opened early in September has been provided primarily in order to give much needed relief to the Hampstead Exchange. It is of the No. 10 type and is situated in a building which was originally the Kilburn Fire Brigade Station. All the installation work has been carried out by the Sectional Engineer with his own staff and the workmanship will compare favourably with that in any other London Exchange. The installation was effected under many difficulties, owing to the occurrence of strikes at manufacturers' works which caused delay in the supply of material, but nevertheless by making suitable arrangements it was possible to keep to the time table. The total number of subscribers transferred from other exchanges is 846, and the number of junctions provided is 162. The nominal capacity of the exchange is for 2,000 subscribers. Sufficient space is available at the rear of the existing building to enable a larger exchange to be erected in due course.

Toll Exchange.

The radius served by the Toll Exchange has been increased and 97 circuits serving towns as far away as Brighton, Chelmsford, Guildford, Tunbridge Wells, &c., are now being diverted to this exchange. This has involved the provision of an additional junction cable to Gerrard, which is now proceeding.

Lighting of Post Office Buildings.

Some interesting experiments are being carried out by the National Physical Laboratory Committee on the lighting of public buildings. An experimental building has been erected at Teddington and will be used for investigating the various problems in connexion with the lighting of public offices including Post Offices. The Post Office Engineering Department is represented on this Committee.

Telegraph Improvements.

It is the writer's privilege from time to time to meet, on the bowling greens around London, certain hale and hearty veterans of the C.T.O., who were giants in the days when practically all telegraph messages were signalled in Morse characters by hand, with occasional resort to Wheatstone working. If any of these gentlemen ever visit the scenes of their former labours, they must feel some astonishment at the rapidity with which changes are being effected. For instance, during the last financial year two Morse keyboard perforators of the Gell type, each capable of producing four slips simultaneously were installed. A newly-designed electrically-driven Creed set was placed on trial, the chief advantage of the new set being the replacement of pneumatic by electric power.

Considerable extensions have been made in the use of Baudot sets. Quadruplex duplex sets were fitted on circuits to important provincial towns, and the total number of circuits of this type was thus brought up to 61, giving 432 channels. A number of triplex duplex and double duplex sets were fitted on foreign circuits working to Amsterdam, Marseilles, Berlin, Hamburg, Frankfurt, Rotterdam and Brussels.

A few of the other innovations to be found working are the Baudot keyboard perforators of the Booth-Willmot pattern ; the Baudot re-transmitters ; a device for printing automatically a heading to the messages received on the Western Electric Multiplex ; the addition of Western Electric keyboard perforators and transmitters to the Murray duplex multiplex apparatus, thus making uniform the method of transmission ; the replacement of Baudot receivers by Kleinschmit printers, thus giving page form reception ; the addition of devices to the Siemens high-speed apparatus which has increased the rate of working by 50 per cent. ; the Morkrum Teletype, described by our American friends as the "Ford" of machine telegraphs, and the extended use of vibrating relays.

New devices have also been applied to the Imperial Cable with a consequent increase in the speed of working, and means have been found for converting the syphon recorder signals into printed characters. The list might be extended, but sufficient indication has been given of the advances that are being made.

A close examination of the improvements just referred to shows a marvellous adaptation of the most recent discoveries in science. For instance, the three-electrode valve had hardly emerged from the laboratory before it was seized upon by the telegraph engineer as a possible means of reinforcing the weak signals received over a long cable. One is tempted to enthuse over the subject, but is sobered by the reflection that Miss Dorothy Turner and her friends will point the finger of scorn at this column and say "Those technical fiends just drive us crazy." Well, we will refrain, but we should like to assure them that those who write notes on technical subjects are not altogether as dry as dust. We have other moods when we enjoy the things that they enjoy, and therefore we are looking forward with great pleasure to the notes that the Editress supplies each month. We hope Miss Turner's colleagues will respond to her appeal and give us dainty fare.

Amateur Wireless.

The tide of enthusiasm among the London Engineering District staff is still rising and is now getting beyond a joke. There was a time when it was possible to get away from technical matters for half an hour, and to talk about ordinary daily affairs during the luncheon interval. Now, however, the conversation is monopolised by the wireless terror who describes in detail the apparatus made out of a clothes-post, fencing wire, seven hairpins, a garter, a bell coil and a Brasso tin. Mouthfuls of food are impatiently bolted in order to tell a bigger one about the message received from Paris, or the heavenly music heard on the preceding evening. In many instances, the only justification for the use of the word "heavenly" is that the noise is certainly unearthly. Serious consideration is being given to a suggestion that in addition to a tax for the benefit of the broadcasting firms, the Postmaster-General shall be asked to put a tax on wireless gossip, the proceeds to be given to the Children's Country Holiday Fund.

It is noted with regret that the series of articles on Wireless Telegraphy has now come to an end. The thanks of readers are due to Mr. Addey for employing his valuable time in setting out so clearly the principles and practice relating to this fascinating subject. Mr. Addey will be glad to know that his articles have been eagerly read by many members of the London Engineering District staff.

Age Ripeneth Experience.

The late Engineer-in-Chief on several occasions expressed the view that in the early years of his career, an engineer should have a high percentage of technical knowledge and that as he progressed in years and position other qualifications would, of necessity, rank first in importance. In light of Sir W. Noble's expression of opinion, the following extract from Rose Macauley's book, *Dangerous Ages*, is interesting :—

> "If you have broken off your studies at the age of 21, and resume them at 43, you will find them a considerable tougher job than you found them 22 years before. Youth is the time to read for examinations; youth is used to such foolishness and takes it lightly in its stride. At 30, you may be and probably are much cleverer than you were at 20; you will have more ideas and better ones and infinitely more power of original and creative thought, but you will not probably find it easy to grip and retain knowledge out of books and reproduce it to order. So the world has ordained that youth shall spend laborious days in doing this and that middle age shall, in the main, put away these childish things and act and work on, or in spite of, the information thus acquired."

The winter session will begin shortly at the London Polytechnics and the younger members of the staff are reminded of the advantages to be gained by making use of the facilities afforded for gaining technical knowledge which is bound to stand them in good stead in their official lives.

Telephone Engineers to the Fore.

Attention has already been drawn to the election of Mr. Frank Gill as President of the Institution of Electrical Engineers, and now comes the news that Mr. Frank B. Jewett, one of the leading telephone men in the States

Digitized by Google

has been appointed President of the American Institute of Electrical Engineers. It is fitting that men connected with one of the most active branches of Electrical Engineering should control, for a time, the destinies of the two sister Institutions.

More Uses for the Telephone.

Many are the uses to which the telephone is now being put, and some of these have been chronicled in these notes. One of the latest suggestions is to use the telephone circuit as a silent burglar alarm. The inventor claims that when his apparatus is used the entry of a burglar into a house will give a distinctive signal at the exchange without apprising the visitor that the signal has been given. The first intimation received by the burglar will be the descent of a policeman's truncheon upon his cranium. If the midnight visitor happens to be a telephone officer "who has been detained late on business" and has forgotten his key this new system may not become very popular.

CABLE BALANCING STAFF OUTING.

On July 1 the members of the London Cable Balancing staff who have been engaged on the London-Watford cable went to Burnham-on-Crouch by char-a-banc for a day's outing. The party which numbered twenty-five included four friends. After a delightful ride through pretty country scenery, dinner was partaken of at the White Hart Hotel. The inner man having been refreshed, adjournment was made to the cricket field where the long outstanding challenge of the Jointing staff to the Testing staff was fought out. Who won is a secret! There may be reprisals. After the match and a visit to the chemist for sundry repairs, a walk was taken along the river bank. A photo of the group was then taken. Tea was followed by a few songs at the piano and the return journey commenced at 7 o'clock. Everyone arrived home feeling better and happier for the day's outing. The event marked the approach of the successful completion of the work on which all have worked well and in perfect harmony. The outing was initiated by the men who invited the "others" to join them. Messrs. F. J. Langford and W. G. Boultwood organised the trip and carried out everything according to plan—a very commendable performance, for which they were thanked.

PHOTOGRAPHS OF THE CENTRAL TELEGRAPH OFFICE.

IN connexion with the bazaar which is being held in November, arrangements have been made for a very complete photograph album of the different Galleries of the Central Telegraph Office to be produced. The proofs of the album have been seen, and it may be said that the photographs are wonderfully clear, and show the size of the Galleries and the different types of apparatus installed there. Care also has been taken that that portion of the Galleries where the larger provincial centres are connected has been put well in the foreground in its own particular photograph. It seems to be quite modest to describe the album as a true example of the photographers' art and at the same time a useful link between widely sundered bodies of men and women. Specimens will be sent to the larger offices as soon as they are available. If it should happen that any officer in the provinces would care to have copies, they may be obtained for 2*s*. 6*d*. post free by applying to Mr. C. P. Burch, "F," Division, Central Telegraph Office, London, E.C.1.

EXTENSION OF THE LONDON TOLL AREA.

THE London Toll Exchange has been working for just over a year and the experience which has been gained has shown that the toll system is an economical and expeditious method of handling the shorter distance trunk traffic. Approximately 95 per cent. of the traffic which has been received during the 24 hours of the day has been dealt with on demand, while even during the busy hour itself 85 per cent. has been disposed of at once.

The traffic has increased steadily since the opening of the exchange, and the present figures show an increase of 30 per cent. on those for the corresponding period last year. During the month of June the daily traffic increased to a figure practically double that of the previous September. It was, however, disposed of without difficulty and the only delays which approximated to half an hour were experienced on routes known to be short of lines, viz., Dorking, Leatherhead and Gravesend. It is expected that the cables to each of these towns will be completed before next summer.

The capacity of the London Toll Exchange will permit of an increase in traffic without prejudicing future development and on Sept. 30 next the area served by the exchange will be extended to include the places at present obtained over the trunk routes between London and the following towns :—

Brighton, Chelmsford, Crawley, East Grinstead, Guildford, Leighton Buzzard, Tonbridge, Tunbridge Wells.

These number 62 exchanges and 27 rural call offices. It is expected that the extension will result in a 20 per cent. increase in traffic.

The number of trunk lines serving the towns involved in the extension amounts to 97, of which 40 are outgoing from, and 57 incoming to London.

In deciding upon the towns to be included in the extension of the area, regard has been paid to community of interest with London, to the adequacy of the lines to carry the traffic on a no-delay basis and to the possibility of increasing the number of lines in the near future.

THE INSTITUTE OF PUBLIC ADMINISTRATION.

THE Institute of Public Administration which has just been founded on the initiative of the Society of Civil Servants, is the outcome of a movement amongst those engaged in the public services, national or local, to secure a fuller recognition by the public and by the services themselves of their status as a professional body with great ideals and traditions and with the common purpose of studying and improving the mechanism of administration. Of the need for such an institution there can be no doubt, that it has awakened the closest interest in all those interested in the corporate life of the service is proved by the fact that men like Mr. Stuart Bunning, Mr. J. W. Bowen, Mr. Levi Hill (of N.A.L.G.O.), Mr. Shayler, Mr. W. G. Boys and Mr. Alefounder sit on the interim council side by side with such well-known Civil Service and local government officials as Sir Stanley Leathes, Sir Cecil Harcourt Smith, Sir Henry Bunbury, Sir Homewood Crawford, Sir Robert Fox, Mr. E. F. Wise, Mr. John Lee and Mr. Montagu Cox and such administrative experts as Sir William Beveridge and Mr. Harold Laski. Lord Haldane has consented to become the first President and Sir James Bird the Clerk to the London County Council, one of the vice-presidents.

The promoters have set forth an ambitious programme of aims and objects amongst which the most prominent seems to be the study of (i) the vocational or professional practice of public administration ; (ii) the machinery necessary for the efficient day-by-day practice of public administration ; and (iii) the principles of historical, economic and political science with special reference to public administration. The Institute will encourage the comparative study of administration in this and other countries, promote good relations and social intercourse between the different branches of the public service and publish a quarterly journal, the first number of which will be ready in January. This journal will contain authoritative articles from the pens of leading administrators and will be issued free to all members and associates. Lectures and discussions will take a prominent place in the programme, and amongst those who have already promised to read papers during the coming session are Sir Oswyn Murray of the Admiralty, Sir W. H. Clarke of the Department of Overseas Trade, Sir John Pedder of the Home Office, Sir Sidney Olivier, Sir Josiah Stamp, Mr. S. P. Vivian, and representatives of the French and Dutch Civil Services.

The Institute will not concern itself with "trade union" questions, neither will it express or discuss political opinions. Its business will be to perfect the machinery set up to administer the laws, and its motto will be those wise words of the "most rational and keen-sighted of old Englishmen of the world"—

For forms of government let fools contest ;
Whate'er is best administered is best.

No movement could be of greater interest and importance to those readers of this JOURNAL who, in however humble a capacity, are assisting in the work of administering the telegraph and telephone services at present so much in the limelight. All are invited to associate themselves with it, those engaged in an administrative or executive capacity as members, others as associates. The subscription for members will be £2 2*s*. 0*d*. ; for associates 10*s*. 6*d*. Fuller particulars and forms of application can be obtained from the Honorary Secretary, Mr. H. G. Corner, 17, Russell Square, W.C.1.

"TALK OF MANY THINGS."

The all-absorbing topic this month is the Competition, to which we made preliminary reference in our last issue. We hope those allusions have piqued our readers' curiosity to such an extent that they are eager for details and will hasten to take part in it.

It is very simple. Almost every telephonist has encountered some extremely amusing happening in the course of her work. Let us all enjoy the laugh together! We want our readers to write the story of the really most humorous incident which has happened in the course of a telephone career. Literary ability does not count so much—the funniest and most original stories will be awarded the prizes. Yes, indeed, there *are* prizes. Quite piquant ones too, which, we hope, will prove a great incentive. Here they are:—

1*st Prize.*—A really serviceable, self-contained black "switching" apron.

2*nd Prize.*—A year's copies of the Telegraph and Telephone Journal *free.*

3*rd Prize.*—A neat little mirror to hang inside the locker door.

The story must not be longer than 500 words, written on one side of the paper only. Competitors may send as many contributions as they wish.

Most cordially we invite efforts from our Provincial colleagues.

Contributions should be posted to the address given at the end of this column and marked "Competition."

Details as to closing date, &c., will be given in the Journal next month.

Telephonists will want to thank Mr. Niblock for the decoration which adds so much to the attraction of our column. He has certainly represented us as beings of great loveliness, and the scroll of powder puffs and hairpins leaves no doubt as to the feminine nature of matters thereunder.

To-Day's Great Thought.

Shakespeare—like Sir James *Cantlie.*

Oh, what men can do! What men *may* do. What men daily do, *not knowing what they do*!

Parlez-vous Francais?

Verily pride goeth before a fall. One day the chief sent for me to come to her desk as she wanted to speak to me. I endured the usual conscience prickings and fearful anticipations *en route*, "I want you to be the holiday relief at the Pall Mall Hotel," she said. "I have chosen you, because I understand that you speak French a little, and this hotel is so cosmopolitan, you are likely to find your knowledge of French very useful."

I felt distinctly "bucked"—there is no other word to describe it. Had I not passed a fairly difficult exam. with honours in French? Never before had I been able to properly air my learning, and I was truly elated at the prospect of being able to speak with visitors from the Continent. I was immediately despatched to the P.B.X. in question, in order to "listen in" and get some ground work of local knowledge.

Being strange to the ways of hotels, I had no idea that employees were expected to enter by a dark little doorway in a side street, so I made my entrance through the princely and imposing front doors which were reserved for guests and visitors. I found myself in a vast, richly carpeted, much be-palmed lounge, and instantly felt most hatefully small and insignificant. I was miserably aware that my hat had seen more than two previous summers and that my blue serge skirt was reflecting the brass fern pots and gleaming stair rods in the surface of its shining seat!

However, gathering the remnants of my dignity to me, I looked around for a minion that I might haughtily demand the whereabouts of the telephone room. A little way from me was a youth in well-worn tweeds and a general air of disreputableness. I said, "Could you direct me to the switchroom, please?" He gazed at me vacantly, slowly produced a monocle, fixed it, regarded me again, and finally drawled, "My dear old thing, I haven't the foggiest."

"Bad shot," I reflected, as I bowed and turned away. An immaculate personage, who could have passed for Beau Brummel of to-day (and whom I afterwards discovered was a reception clerk) contemptuously waved me to a wide stairway opposite and murmured something about the switchroom being in the basement.

I descended the stairs and found myself in a labyrinth of pillars and doorways. A tall, smart-looking lady in black was crossing the open space in front of me, so I approached and said, "Could you please tell me where is the telephone room?" She beamed upon me in a friendly fashion, and said something which I understood to be, "Je ne comprends pas!" A spasm of joy seized me! Already had the opportunity arrived when I could converse with a native. Beaming, I returned, "Pardon, Madame, mais voulez-vous me dire où est le ——" and then I stopped short. For the life of me I could not think what in all the world was French for "telephone room!" I racked my brains whilst the smart-looking lady regarded me expectantly. Finally, giving it up in despair, I resorted to the much-tried, universal language of gesture. Placing one hand to my ear, as if I was holding a receiver, I held the other to my lips and went through the pantomime of speaking on the telephone.

A light broke over the countenance of the lady in black. "Ah, oui!" she exclaimed, in ecstatic comprehension. "Manger!" she added to my surprise, and taking me by the arm, she propelled me in front of her, and opening a door marked "Courier" she pushed me in the room. I turned to discover myself in the presence of many people very busily eating. Truly this was not the proper place for me. I hastily opened the door and stepped outside. There was the lady in black waiting by the door and beaming benevolently upon me. Red in the face, I again went through the performance of speaking on the telephone. Before I was aware of her intention she again seized my arm and pushed me into the room marked "Courier." This time, the occupants of the room left their lunch to look interestly at the disturbers of their peace, wondering what could be happening.

I waited for a moment, then cautiously wriggling round the door, endeavoured to escape from the lady in black and take my chances. With the most benevolent intentions she was still waiting for me and as I saw her move to grasp my arm again, I ejaculated in desperate despair, "Non, non manger," and relapsing into my mother tongue in my extremity, I said, "I don't want anything to eat, thank you, I only want to speak on the telephone." To my utter surprise, the tall distinguished foreign lady said in perfect English, "Oh, you want the telephone, I'll show you where it is!"

Thankfully slinking into the sanctuary of the switchroom, I hid my diminished head beneath the yoke of my instrument and said not a word of my downfall to my colleagues.

Yes, verily pride goeth before a fall!

Dorothy Turner.

* * * *

Several contributions to this column have been received during the absence of the Editress on leave. They are held over for future issues.

Contributions to this column should be addressed: The Editress, "Talk of Many Things," Telegraph & Telephone Journal, Secretary's Office, G.P.O. (North), London, E.C.

PRESENTATION, ST. ALBANS.

On Friday, Aug. 11, a presentation was made to Mr. E. J. Thompson Assistant Traffic Superintendent, St. Albans, on the occasion of his transfer to the Hull Trunk Exchange.

Mr. J. H. Wilson, District Manager, in a short speech referred to Mr. Thompson's good work in the St. Albans district, and said that the district was losing a conscientious officer, who, in his 14 years' service, had an excellent knowledge of the district, so essential to Traffic work. It was with feelings of regret that he saw him leave, and he wished him success, on behalf of the staff, in his new sphere. Mr. Wilson then called upon Capt. H. E. Parry, Traffic Superintendent, to make the presentation, which consisted of an aneroid barometer, pipe and tobacco pouch, and an illuminated address (with over 100 names thereon). Capt. Parry in a few well-chosen words, spoke highly of Mr. Thompson's work in the Traffic Department, and also of his friendship with him. It was with feelings of regret that he saw him go. That he would meet with success in his new venture was certain. Mr. Collins, Chief Clerk, also spoke, and referred to Mr. Thompson's good work, and wished him every success. Miss Whitmore spoke on behalf of the ladies.

Mr. Thompson, in a neat speech, suitably replied.

ANOTHER BRAIN WAVE.

WE quote the following extract from the *Sheffield Telegraph* of Sept. 12 about a discourse on wireless telephony before the Sheffield Rotary Club on the preceding day:—

"Mr. Lloyd, turning to another phase of the subject, said that he thought the greatest benefit that wireless would bring to mankind was that it would endow us with the ability to read thought. He thought everyone had had personal experience of some degree of telepathy. The essentials for the occurrence of this phenomenon were that action (thought) in the brain of one person should produce re-action (similar thought) in the brain of another at some distance away. Sir William Crookes recognised this force and rightly described it as a form of wave motion, at that time undetectable by any existing instruments, but closely akin to that form of wave motion they knew as wireless waves. He submitted that the next step was inevitable, and it would be the detection of those waves of thought. If this came about, the human race would benefit by the ability to read thought, for it would be necessary for all to discipline their thoughts, an exercise that would surely reduce crime. He felt it would also be useful in adjusting the difficulties and differences between capital and labour, by permitting each side to read the thoughts of the other, and so to realise that their intentions were honest."

Can you imagine anything more horrible? Not content in recent years with the discomfiture of our corporeal bodies by flame throwers, thermite, poison gases, and such abominations, our scientists propose to add yet another tragedy to existence by exposing our innermost thoughts to the public gaze. We wonder if there be a man or woman alive—even a scientist—who can contemplate such a possibility with equanimity. Carlyle in that ponderous satire of his "Sartor Resartus" draws a vivid picture of the social collapse which would follow the loss of our clothes. But the new theory would have for its object the complete dissection of the individual body and soul, an object which would not only destroy the social fabric as we now know it, but would make it practically impossible to build up another based on mutual liking and trust.

But no poison is discovered without its antidote so that we may be sure that another inventor would be prepared with a thought-proof screen for those who could afford such a luxury. Business men and women would then go forth to their accustomed battle of wits fully equipped like knights of old with armour for the fray. Civil Servants would not of course require such appliances, as the critics say they never have any brain waves.

"IF——"

A PARODY.

To MISS X (*Telephonist*).

(*With profound apologies to* Mr. RUDYARD KIPLING.)

If you can keep your head when subs about you
Are losing their's and blaming it on you;
If you can trust yourself when supers doubt you,
But make allowance for their doubting too;
If you can "call" and not be tired by "calling,"
Or being lied about, don't deal in lies;
Or being bawled at, don't give way to bawling;
And yet don't look too good nor talk too wise.

If you can have a friend and still expect her,
After a row, to treat you just the same;
If you can meet with super and inspector,
And treat those two impostors both the same;
If you can bear to read the *truth* you've spoken,
Twisted by scribes to make a trap for fools;
Or watch the things you gave your life to broken;
Or spend your days in learning worn-out rules.

If you can make one list of all your rises
And write them down upon a penny stamp,
And smile: yet "Be Prepared" for all surprises,
And journey on towards the supers' camp;
If you can force your heart, and voice, and sinew
To "call up" subs. long after they have gone,
And so keep working when there's nothing in you
Except the voice which says to them "Hold on!"

If you can talk with traffic superintendent
Or walk with Kings—nor lose the common touch;
If you can call yourself an "independent,"
Yet all men stay with you, but none too much;
If you can fill that final half-a-minute
With thirty seconds' worth of honest toil,
Yours is the earth and everything that's in it,
And—which is more—you'll be *a Super-Girl.*

C. V. LONG (*Gerrard Exchange*).

TRIAL BY JURY.

OR A MUCH-NEEDED ASPECT OF THE TELEPHONE SERVICE.

Scene: *A Court Room.*

Characters:—A Prisoner at the Bar.
A Judge.
Prosecuting Counsel.
Counsel for the Defence.
Witnesses.
Jury of 12 Operators.
Supervisors.
Usher.

JUDGE (*addressing the prisoner*):
The Court is met to-day, you know,
For each to have his say, you know,
Before this Jury good and true,
To see what shall be done with you;
And if your guilt is proved, d'you see,
Our mind shall not be moved, d'you see,
From stern resolve, at this grave time,
To make the punishment fit the crime.

JURY: His stern resolve at this grave time,
Is to make the punishment fit the crime.

JUDGE (*resuming*):
So when the charge is read to you,
Just listen what is said to you.
And if the charge you can refute,
I prithee do not stand there mute.
But if no refutation can
Put forward be by any man;
Why, then, 'twill be my task sublime,
To make the punishment fit the crime.

JURY: This, then, will be his task sublime,
To make the punishment fit the crime.

JUDGE: Let no more be said,
Till the charge is read.

JURY: He says that we must say no more,
Until the charge is pondered o'er.

WITNESS FOR THE PROSECUTION (*starting up*):
Many doleful crimes and deeds he has done
And of more to sow the seeds has begun,
He's committed sins in plenty.
Fourteen, sixteen, eighteen, twenty;
One by one.
And the Prosecution thought
It was right,
That a Jury should be sought—
Unbiassed quite!
So that Prisoner for the deeds,
That he sows as thick as weeds,
They can sentence with unparalleled delight.

JURY (*singing to tune of "Twelfth Night"—or "What you will"*):
He's for ever sowing troubles,
Sowing troubles all the way,
Telling the Press,
Fibs more or less,
Giving them "copy" from day to day,
Now we're going to try him,
See his guilty air,
He's for ever sowing troubles,
Sowing troubles, everywhere.

JUDGE (*to Jury*):
Silence, my gentle Jury,
Restrain awhile your fury.

JURY: He says we must our wrath subdue,
I think he's rather sweet, don't you.

JUDGE: Now, prisoner, hist, while Counsel reads
A list of your dark and daring deeds,
A list of the scurvy, stealthy tricks,
That you have done if your guilt we fix.
And if you can't your guile retain,
This Jury good and true
Will sentence you—that's plain.

JURY: And if his guile he can't retain,
This Jury good and true,
Will sentence him—that's plain.

JUDGE: Now, Prisoner, hush, the while the facts
Are told of your grim and guilty acts.
Oh, hist! once more, though Counsel shirks
To read the whole of your woeful works.
And if you're wise, you'll humbly own
That you have spoken Treason of the Telephone.

Digitized by Google

JURY: And if he's wise, he'll humbly own,
That he has spoken Treason of the Telephone.

JUDGE: Proceed, proceed,
With each murky deed.

COUNSEL FOR THE PROSECUTION:
The prisoner, I must relate,
Though much indebted to the State,
Has railed against his lawful rate,
Demanded, too, a large rebate,
Or else an advance of his rental date.
He's tried to hold, in long debate,
The girls whose most unhappy fate,
It is upon his calls to wait.
And next to pressmen, small or great,
Included them in each day's "hate,"
And then with treachery innate,
His own misdeeds he'd adumbrate.

JURY: And then, with treachery innate,
His own misdeeds he'd adumbrate.

PROSECUTING COUNSEL:
The second charge reads thus, in *re*
The prisoner we all can see,
The allegation is that he
Refuses to consult the free
Fair preface to Directory.
His "five" and "nine" he doth decree,
Mistaken each for each shall be,
Nor will he use a rising key
Nor listen to one earnest plea
To clear connexions rapidly;
And graver still, let all agree
He *will* not roll the "r" in three.

JURY: Oh, graver still, we all agree,
This failure to roll "r" in three.

JUDGE: Now, call the witness for defence,
For, hush, the silence is intense.

WITNESS: May I address my words so few
To *one* of the jury good and true.

JUDGE: You may, you may;
Start straight away.

WITNESS (*singing*):
A little telephonist sat on a chair,
Singing "Number, please, number, please" daily,
So I said, "Oh, Telephonist, what do you there
Singing 'Number, please, number, please' daily,
Do you do it because it's a marvellous feat,
Or because the subscribers are pleasant and sweet,
Oh, I wish I knew why you so often repeat
That 'Number, please, number, please' daily."

TELEPHONIST:
She said, "I'm off duty, and so I can stop
Singing, 'Number, please, number, please' daily,
And I'll tell you at once, e'er my headgear I drop
Why I *love* to sing 'Number, please,' daily,
Though sometimes subscribers are rather irate,
And sometimes we're tired, and the calls will not wait,
We do not mind that, for we're serving the State,
Singing, 'Number, please, number, please,'" daily."

WITNESS (*with emotion*):
Of the prisoner's guilt I am assured,
In a deep, dark cell he should be immured.

JUDGE (*to Witness*):
We did not ask you here, young man,
For your powers of elocution.
You must not interfere, young man,
With the rights of the Prosecution.

WITNESS: Very true,
I'm with you,
In your view.
But for hopes he has marred,
He deserves ten years' hard.
Or a fine of five thousand in lieu.

JUDGE (*to Witness*):
Silence, knave.
Desist, behave!

(*to Prisoner*):
Now, prisoner at the Bar, expound.
For hark, the silence is profound.

PRISONER: The long indictment I have heard
Is, let me say it, too absurd,
And I can prove it, in a word
To each's one satisfaction.
One charge that you have read to me
Can very soon refuted be,
I *cannot* roll the "r" in three—
I'm not of Scotch extraction.

JURY: The long indictment he has heard,
Is, let us say it, *not* absurd;
And we can prove it in a word
To each one's satisfaction.
One charge that he has made, d'you see,
Can very soon refuted be,
We each can roll the "r" in thrrreee
Though *not* of Scotch extraction.

JUDGE: Jury, good and true, your verdict tell to me.
(Oh, but they're wrathful, sing Willow, Waley.)

JURY: As your Lordship knows, cut off the man should be.
(Sing Willow, Waley, Oh!)
So our hearts we'll harden
Till he asks our pardon,
(Sing Willow, Waley, Oh!)

JURY (*addressing Prisoner*):
Prisoner at the Bar, oh, have you aught to say?
(Oh, but he's doleful, sing Willow, Waley).

PRISONER: Nothing, Ladies twelve, oh, sentence me I pray.
(Sing Willow, Waley, Oh!)

JURY: When your crimes displeased us,
You should not have teased us.
(Sing Willow, Waley, Oh!)

PRISONER: Jurywomen, twelve, your pardon sweet I crave.
(Oh, they're relenting, sing Willow, Waley.)

JURY: Do you then repent the trouble that you gave.
(Sing Willow, Waley, Oh!)

PRISONER: Oh, I do regret it,
Won't you please forget it.
(Sing Willow, Waley, Oh!)

JURY: Prisoner at the Bar, will you in future strive.
(Oh, but he's doleful, sing Willow, Waley.)

PRISONER: I will do my best to—roll the "r" in five.
(Sing Willow, Waley, Oh!)

JURY: See his sad condition.
This is true contrition.
(Sing Willow, Waley, Oh!)
[*Three Supervisors enter.*]

JUDGE (*waving to them*):
There you are, then;
There you are.

USHER: H'sh, M'Lud,
You go too far.

SUPERVISORS (*timidly*):
Oh, will you please excuse us,
We hope you won't refuse us,
But may we say
Our business, eh?
For sternly the prisoner views us.

JUDGE: There you are, then,
There you are.
Eloquence your
Guilding star.
But lest tears my joy should mar,
Tell us, tell us, who you are.

JURY: But lest tears our joy should mar,
Tell us, tell us, who you are.

SUPERVISORS:
Three little Supervisors walking,
Heard in this Court loud voices talking,
So to the door like mice came stalking,
Finding it left ajar.
Then to our ears came prisoner's moaning,
As at the Bar he wilted, groaning,
None could resist such sad intoning.

JUDGE (*delighted*):
Really! So, *there* you are.

USHER: M'Lud, enough.
This is sorry stuff.

JUDGE (*wrathful*):
I'll clear the Court
Of you, Old Sport.

Digitized by Google

JURY (*to Supervisors*):
We welcome you.
We welcome you.

SUPERVISORS:
We know it's true.
We know it's true.

JUDGE (*to Supervisors*):
Although your entrance was in perfect taste,
The time of the Court you must not waste,
So I'll ask you to listen to a verse or so
Before I tell the prisoner he may go.
So listen, please, while I relate
The reason I became a famous Advocate.

USHER: A Magistrate ?

JUDGE: *NO* ! An Advocate.

JUDGE: When I was a lad of twenty-one,
I used to leave ere my work was done,
And make my way to Carter Lane,
Where every girl has teeth of pearl
—And none are plain.
And while for Her I used to wait,
I planned how I'd become a famous Advocate.

JURY: And while for *me* he used to wait,
He planned how he'd become a famous Advocate.

USHER: The story you're telling the Court, M'Lud,
Has nothing to do with the case,
It's wasting our time, and in short, M'Lud,
It's nothing to do with the case.
I'll be hanged, I expect, for a sheep or a lamb,
But I'm hoping to capture a twopenny tram;
If I miss it, the Jury will hear a loud—slam !
Which has nothing to do with the case.

JURY: If you miss it, we'll hear a word rhyming with tram,
Which has nothing to do with the case.

JUDGE: Prisoner, you may go,
But don't ingratitude show
By any disaffection.
And, whether soon or late,
Always co-operate.
(*Plus* a rising inflection).
And if you cannot capture,
That first fine careless rapture,
Of "r's" rolled roguishly,
The Court will make an order
To take you o'er the Border,
Where many "r's" there be.

PRISONER: Some major irregularities
I know I have committed.
Oh, never before this day was I
To be a subscriber fitted.

JURY: Hear ! hear !
We cheer
And a tear let drop.

JUDGE: And I,
A sigh.
What next, old top ?

USHER (*gloomily*):
All hope is o'er
It's five to four.

JUDGE: Usher, clear the Court,
And catch forsooth your tram.
(Oh, but he's speedy, sing Willow, Waley).

PRISONER: Let me say, M'Lud, it's grateful that I am.
(Sing Willow, Waley, Oh !)

JURY: He has bent the knee then.

JUDGE: Will you dine with me, then ?

ALL: (Sing Willow, Waley, Oh !)

J. M. McMILLAN.

TELEPHONE PROGRESS IN INDIA.

WE learn from the daily press that the Indian Government proposes to establish a telephone service between Calcutta and Bombay this year and automatic exchanges at Lyallpur, Amritsar, Lahore, Cawnpore, and Allahabad. Delhi is the centre of the northern system now approaching completion. Eventually Rangoon will be linked to Calcutta.

LONDON TELEPHONE SERVICE NOTES.

Re-organisation of Clerical Staff.

THE Controller's Office and the outlying Contract Offices have been excited and very much interested in the recent announcement in connexion with appointments arising out of the re-organisation.

The following have been appointed to higher executive posts:—

Messrs. R. Bryson, J. Leslie, C. W. Muirhead, M. Larkins, E. H. Barnes, G. E. Nicholls, J. R. Salter, J. F. Page, J. Hinshelwood and L. J. Lee.

There are many appointments to higher clerical or executive posts. Space does not permit the full list being given.

L.T.S. Success at P.O. Fete.

The ladies' team representing the L.T.S.S.A. in the Championship of the Post Office, were successful in gaining the honour, winning comfortably by about 20 yards. The race was over a distance of 240 yards, teams of six competing. The members of the team were:—

Misses Amos, Phipps and Williams (Regent), Amos and Fenn (Victoria), and McBinney (Western). The winning smile is much in evidence in the photograph reproduced on this page.

Miss Williams was also successful in winning the Individual Championship for ladies of the Post Office.

L.T.S. SWIMMING ASSOCIATION TEAM.
Winners of P.O. Championship.
Miss McBIRNEY. Miss PHIPPS, Miss WILLIAMS,
Miss AMOS (VI), Miss FENN, Miss AMOS (RE.)

London Telephonists' Society.

It is hoped that there will be a good attendance at the Y.M.C.A. Lecture Hall, 186, Aldersgate Street, E.C.4, on Friday, Oct. 13, when Mr. G. Buckeridge will read his Presidential address. The title of the address, "Where are we going ?" sounds quite intriguing, and those who wish to know the answer to the question must put in an appearance at 6.30 p.m. on the day and at the place mentioned above.

L.T.S. Swimming Association.

The first of the two galas arranged for this season took place on Friday, Sept. 15, at the Pitfield Street Baths, Hoxton. The affair was extremely well organised, the time table being followed very closely. The M.C. was Mr. E. A. Pounds and the various officials were representatives from the Southern Counties A.S.A.

The principal results were:—

LEARNERS' RACE (1 width).

Miss Riches (Trunk)	1
Miss Aylett (Hammersmith)	2
Miss Hodder (Paddington)	3

CHAMPIONSHIP OF L.T.S. (100 yards).

Miss Williams (Regent)	1
Miss Fenn (Victoria)	2
Miss Amos (Victoria)	3

There were three heats and the final, all of which were strenuously contested.

INTER-BRANCH TEAM RACE (men) (120 yards).

Traffic Branch (Messrs. Gregory, North, Pettigrew and Beck) ...	1
Accounts Branch (Messrs. Smith, Thompson, Teed and Frier) ...	2
Contracts Branch (Messrs. Skelton, Davey, King and Jenkins) ...	3

This was the first contest for the Lotos Challenge Shield presented by the Lotos Swimming Club for competition between the branches of the Controller's Office.

SUPERVISORS' RACE (33 yards).

Miss Birchenough (Mayfair)	1
Miss J. Davies (Trunk)	2

NOVELTY PUNT RACE.

Winners—Messrs. J. D. Pettigrew and T. A. Beck.

The competitors in addition to propelling punts for a length of the bath had to engage in combat with mops. The event provided a lot of fun.

Principles of Wireless Telegraphy

By GEORGE W. PIERCE, A.M., Ph.D.,
Assistant Professor of Physics, Harvard University.
350 pages, 6×9, 235 illustrations.
Price 18/- net.

A sound treatise on theory, application and construction. Prof. Pierce has taken a leading part in both the practical and theoretical development of wireless. His book is not mathematical. It is regarded as a standard authority.

CONTENTS.—I.—Introduction. II.—Theories as to the Nature of Electricity. III.—Relation between Electricity and Magnetism. IV.—Resemblance of Self-Induction to Mechanical Inertia. V.—Electrostatic Capacity. VI.—Discharge of a Condenser Through an Inductance and Resistance. VII.—Maxwell's Theory, Electric Waves. Electromagnetic Theory of Light. VIII.—Experiments of Hertz. IX.—Experiments on the Identity of Electric Waves and Light. X.—Propagation of Electric Waves on Wires. XI.—Wireless Telegraphy before Hertz. XII.—Wireless Telegraphy by Hertzian Waves. Marconi, 1896-1898. XIII.—Electric Wave Telegraphy by Resonant Circuits. XIV.—Nature of the Oscillation The Grounding of Circuits. XV.—Propagation Over the Earth. XVI.—Detectors. XVII and XVIII.—Crystal Rectifiers. XIX.—Electrolytic Detector and Vacuum Detectors. XX.—Electrical Resonance. Wave Meters. Resonance in Simple Condenser Circuits. XXI.—Electrical Oscillations of Connected Systems of Condenser Circuits. XXII.—Tuning the Sending Station. XXIII.—Some Recent Methods of Exciting Electric Waves. The Singing Arc, the Singing Spark, and the Quenched Spark. XXIV.—Resonance of Receiving Circuits. The Possibility of Preventng Interference. XXV.—Directed Wireless Telegraphy. XXVI.—Wireless Telephony. XXVII.—Some Details of Construction of Wireless Telegraphic Apparatus. XXVIII.—Conclusion. APPENDIX I.—Elementary facts about Electricity and Definitions of Units. APPENDIX II.—Concerning the Calculation of Resistance, Self-Inductance and Capacity.

LADIES' HANDICAP (33 yards).

Miss Malyon (New Cross)	1
Miss McMillan (Minories)	2
Miss Willmott (Avenue)	3

INVITATION TEAM RACE (Ladies).

Money Order Dept. (Naiad S.C.)	1
Post Office Savings Bank (Isis S.C.)	2
Central Telegraph (Centels S.C.)	3

The teams were of six members each, the winners getting home comfortably due to some fine "crawl" swimming.

GRACEFUL SWIMMIMG.

Miss Stansfield (Avenue)	1
Miss Curnow (Holborn)	2
Miss H. Davies (Gerrard)	3

The standard was very high and the ladies who were placed swam beautifully.

In addition to the items mentioned above there was a very fine display of high and fancy diving by three ladies from the Amateur Diving Association and a water-polo match between the Polytechnic and the Star Athletic, the event being the semi-final of the Junior Water Polo Competition of London.

The second gala will take place on Oct. 6 at the same baths.

Culled from the Exchanges.

Gerrard Exchange.

On Sept. 9, the Gerrard staff again entertained the patients at Sidcup Hospital. The men (about 400) were supplied with a high tea and a whist drive and dance. Later in the evening ices and lemonade were served, when our friends contributed some excellent music. We were very pleased to see the Colonel back again and we were warmly welcomed by the new Matron, the Chaplain and Mr. Baker, the sports master. If any of our colleagues at other exchanges would care to visit Frognal with us we shall be very glad to welcome them in the New Year. Many of the men are terrible sufferers and one feels it to be a great privilege to brighten their lives by anything that kindly interest can do. It might be mentioned that the Gerrard staff has raised nearly £300 for this hospital alone during the past three years.

Park Exchange.

On Saturday, July 22, a char-a-banc ride to Dorking was arranged by the staff of Park Exchange.

Punctually at 2 p.m. a very merry party started on what proved to be a really delightful excursion. The sun was surprisingly brilliant and the ride down fulfilled all previous expectations. Tea served in the garden of a Dorking hotel awaited the party, and needless to remark was much appreciated. Following tea someone made the happy suggestion of music and dancing, which was eagerly accepted by all. Later the party dissolved itself into various groups—some for a ramble into the woods, others to see the view from Deepdene, while a few preferred to remain in the garden. It was arranged for all to meet again in the garden at 7.30 p.m., where refreshments were served before the return journey home.

Snapshots obtained by several members of the party are souvenirs to remind us always of a most enjoyable day.

Regent Exchange (during August).

The month has had its ups and downs,
With Fortune's meed of smiles and frowns;
When something bad has come our way,
There's something good another day.

We've been on leave and had our fling
Of bathing, dancing, laughtering;
And now we view as in a dream
Those days, so far away they seem.

Our wages are reduced again;
Our anguished protests are in vain;
So now we exercise the mind,
Some new economies to find.

The sausage, succulent and cheap,
(Long bags of mystery dark and deep)
Must form the mainstay of our lunch;
For tea, a "roll and pat" we munch.

Yet we can e'en forget this woe,
To sit upon the fence and crow;
(O pardon us, we beg in haste,
Indeed, we know 'tis shocking taste!)

But then, we can't help being proud,
We feel we must cry out aloud
To laud each modest heroine
Of matters sporting and marine.

'Tis not the girls themselves who cry,
But we who chair them shoulder high
In grateful triumph. On our lips
The names of Amos, Williams, Phipps.*

DOROTHY TURNER.

* The success of these ladies at the P.O. Fete is remarked upon earlier in these notes.

PERSONALIA.

LONDON TRAFFIC STAFF.

Resignations due to approaching marriage :—

Assistant Supervisors, Class II.

Miss M. A. KILBURN, London Wall School.
Miss E. E. L. GARDNER, Trunk.
Miss E. M. HALLETT, Western.
Miss L. G. JACKSON, Victoria.
Miss H. LISSENDEN, Victoria.

Miss E. VINER, Trunk.
Miss G. E. SMITH, Trunk.
Miss P. J. GREENGRASS, Toll.
Miss E. C. MURDOCK, Toll.
Miss M. I. LANE, Victoria.
Miss A. M. PARTRIDGE, Victoria.
Miss J. C. MURPHY, Woolwich.
Miss W. G. WIGNALL, Woolwich.

ST. ALBANS.

Mr. E. J. THOMPSON, Assistant Traffic Superintendent, St. Albans, to be Assistant Traffic Superintendent, Hull Trunk Exchange.

Mr. H. R. JONES, S.C. & T. (T.), Cardiff, to be Assistant Traffic Superintendent, St. Albans.

MANCHESTER.

Miss B. WEBSTER, Assistant Supervisor, Class II, Eccles Exchange, resigned on her approaching marriage.

The following Writing Assistants resigned on account of their approaching marriage :—

Miss M. WATERHOUSE.
Miss A. C. F. COLQUHOUN.
Miss F. L. MASSEY.
Miss E. D. DOWNES.
Miss E. CHIPPERFIELD.

A varied and choice assortment of gifts were subscribed for each officer prior to her leaving the Service.

LAWN TENNIS.

CIVIL SERVICE CHAMPIONSHIPS.

THESE were played at the Army Sports Ground, Leyton, on Sept. 6.

The Doubles were won by A. C. Belgrave and T. E. Hanson (Secretary's Office, G.P.O.) beating A. D. Stocks and E. B. Shine (Ministry of Agriculture) 6—4, 9—7, 6—4.

The Singles (English Championship) were won by A. C. Belgrave (Secretary's Office, G.P.O.) beating W. J. Whittaker (Royal Mint) 7—5, 6—4, 4—6, 6—4.

Mr. Belgrave subsequently beat the Scots champion, R. Kenyon-Letts (Inland Revenue), 7—5, 6—4, 1—6, 6—0, for the championship of the whole Service.

THE BUSINESS MAN AND THE CIVIL SERVANT.

BY EUSTACE HARE.

(*Continued from page* 3.)

I can claim to speak with some knowledge of my subject, because in the progress of forty-two years it has been my fortune to pass from a private business to a company's ramifications and thence to the service of the State; and for ease and freedom from worry give me the company first and the private concern next.

It would be an absurd affectation to suggest that service in the National Telephone Company or in the United Telephone Company which preceded it, was a bed of roses. Every one in this country or any other who has knowledge of telephone administration and organisation would laugh at the idea; but of the United Company I could recount tales which would astonish its directorate of business men and shareholders, if any still survive—a happy band, who, in the last year of the company's separate existence, received a dividend of 15 per cent., and for each share in the "United" were allotted two and a half shares in the company which arose from its ashes. Not that this handsome return was undeserved, for the recipients were pioneers of a then uncertain enterprise in a conservative business world; and the missionary effort among the old-fashioned firms of the day was uphill work.

Nevertheless I can safely say this, that, speaking of the parent company, which I joined in 1883, success was not due to sound and competent management, but to the instrinsic value of the invention and to the possession of patent rights. The same acumen that moved the unbusiness-like Post Office to safeguard its monopoly on behalf of the taxpayer actuated the business-like "United" Company to exact royalty from selected subsidiary companies on behalf of its shareholders.

It was not until the year 1893, some thirteen years after the inauguration of the system, that real development and enlightened management on a scientific basis became the order of the day; and this was due to the introduction of a general manager who, at the outset, had no more knowledge of the intricacies of a telephone system than a post office man has of running a draper's shop. And what was he? Not a captain of industry nor what is commonly known as a business man, but a lawyer, a town clerk, with the lawyer's trained and reasoning mind. True he had escaped the blight of a Civil Service examination and, I believe, of a University course, but for all that, a course of legal study as of any study is not inimical to the attainment of a vigorous understanding and of lucidity of reasoning, and these qualities applied to any business are not without their uses.

But, strange to say, as the telephone developed under his auspices, the liveliness—for the service has ever been a topic for humour—began. Before his time the atmosphere at headquarters was comparatively a monastic calm; we were as a cloistered community—but ambling along in a fool's paradise, shortly to be ruffled by the march of events. The easy-going £20 a year for an unlimited service was a boon to the large user and the wealthy, and complaints were comparatively scarce. But there arose a clamour for cheapness; so, side by side with that subscription, the lower message rate was introduced; with the result that the large user clung to his flat rate and the small user claimed the lower charge. Highly unsatisfactory when a dividend had to be earned; and profits dwindled. What then? The next step was to inaugurate a measured rate for all comers, unoptional, except in London where the Post Office was in competition; and the Post

Digitized by Google

Office, mark you, not the Telephone Company, saved the situation for many years for the large user. And little thanks it got for it.

Those of us among the staff of the National Telephone Company who had come into contact with officials of the Post Office prior to the transfer of the undertaking to the State were under no delusion as to the business capabilities of our future masters and colleagues. From my earliest days in the company I was accustomed to hear of Post Office officials—some of whose names are now to be found only in dusty files—spoken of without rancour, as able men defending, not their own positions, but the broad interests of the State, honestly and squarely against what was, popularly, becoming to be regarded as the encroachments of a gigantic private monopoly. They may have been mistaken, but if so the public were with them—and by the public I mean chiefly the commercial world. If, as has been frequently asserted the Post Office was in the earlier days a stumbling-block to telephonic progress, it was ably supported by other public, local and private bodies who were in no haste to grant facilities for development except at their own price. To those who have memories, the conduct of the negotiation of the transfer of the business to the State before and during the final arbitration in 1912, bore ample testimony to the disinterestedness and untiring industry of the men of this particular branch of the Civil Service.

And when we, reputed men and pupils of business came over to the service of the State, what did we find ? In a word, that a far higher standard of work was expected of us for the same pay ! I am not exaggerating ; for, at all events among us on the clerical side, it was common talk. Our cares and responsibilities were multiplied, and we found ourselves side by side in competition with colleagues who, at the least, and at the outset, had given some indication of their general ability by the test of a stiff examination.

There were other differences, too, which made the parting of the ways a matter of some regret. For I had reached a stage where a daily free luncheon was, at once, a privilege and an obligation—a useful institution whereby the head official circle were enabled to exchange views and discuss subjects of general or high import. Another wistful memory is that of the recuperating week-end recess unknown to the Civil Servant in its full blessedness ; the arrangement being that my immediate chief and myself were free from official attendance every alternate Saturday ; no uncommon proceeding in the business world. Think of it ! A similar arrangement in the Post Office would mean a twenty-six day cut out of the annual leave ; to say nothing of other days off to bury relations or visit the dentist.

Again, " subsistence allowance " was a term unknown in those generous days. On one occasion I was sent to Stockholm on a commission of enquiry. Before leaving I hinted, delicately, at the question of expenses. With confidence in my rectitude the general manager dismissed the subject by opining that I should know how much money I set out with and how much I brought back, and that a calculation of the difference was not beyond my arithmetical powers. But I have no desire to lacerate the feelings of my present colleagues with further attractive samples of business management ; they are first-hand, however, and therefore reliable.

At a moment, I, on my entrance into the Post Office service, at all events, found myself in the public eye ; for within a week or so of my translation, I was confronted with the apparition of my name in full at the foot of an innocent letter in a column of a daily newspaper. Such a thing had never happened to me before, and my first feeling was one of dismay.

For, consider what this means. The ordinary business man may write or sign fifty letters a day in the sure confidence that, acceptable or not, they will be scanned by none but the intended recipients. Were it otherwise : did he imagine that any one of his letters might become public property, might even be the subject of a question in Parliament, with what care would he not only marshal his facts but express them, and how much the more would he be exacting in the selection of his staff ? This early incident of the published letter was both a warning and a lesson—a warning to exercise caution in all my doings and the lesson of the high grade of work the public demands, and demanding, gets. And if it does not get it : if, for example, among the half-million telephone accounts despatched quarterly a frail human is caught tripping, the chances are all in favour of his lapse being brought home to him in a way unknown in any private concern.

Complaint of the telephone service was not born in the Post Office ; it came into it full grown. For sixteen years it has been my province to investigate and explain and diagnose the ills to which the telephone user is heir ; some real, some imaginary, and some incurable—for, so long as human impatience endures it is destined to be provoked by a system which calls for individual effort every time it is put in motion. And to pretend that all was peace in this connexion in the days of the Telephone Company is ridiculous. Relatively, in proportion to numbers of subscribers, complaints of inefficiency were as frequent then as they are now : in fact the company was so unpopular that I have a distinct recollection of a shyness to identify myself with it, and yearned for the millennium which subscribers assured me seriously was due on Jan. 1, 1912.

Personal feeling was unknown to me in the company's service, but I have not been free from evidence of it in the Post Office, and I have even been threatened with a subpœna to answer for my misdeeds in a court of law—which to my disappointment never matured. In one or two instances letters have come to me addressed thus : " E. Hare, for the Secretary, General Post Office," but except for its originality the humour of this manner makes no impression. Forty years of telephones is a blunting experience and makes for philosophy ; and were it otherwise, the end necessarily for me is not many years ahead.

But there are others still in the stage and of the age of sensitiveness, and among them there stands out the vast army of telephone operators, or as they are now known, telephonists. They are ever in the first line of attack : from the coarse bully who overflows with abuse whenever he is checked in getting at once what he wants, to the titled personage who vents his or her displeasure in refined sarcasm or indignant remonstrance ; as, for example, a case I remember in which a subscriber complained that the telephonist refused to address her as " My Lady."

Telephone operators were as much targets for spleen from the individual and for ridicule in the comic press in the day of the National Telephone Company as they are now ; but what they endure is endured in sensible silence. Rest-rooms were not invented by the company merely as playgrounds for the relief of exuberant spirits, but mainly for the calming of nerves wrought to a pitch of uncontrollability by accumulated attacks from the irritated and ill-humoured. But those who succumb even temporarily are very few ; and this is only to be expected from the type of girl who, in War time, traversed the streets during air-raids to take her post at the switchboard, while men made bee-lines for dug-outs.

We are all blackened with the same brush ; indifference, indolence, incompetence, and (in the telephone service) even dishonesty ; inasmuch as I have more than once been moved to ask a libeller at whose instigation he supposed he was overcharged in his telephone account and did he suppose that our sense of duty to the taxpayer so obsessed us that we were not above collecting fictitious fees on their behalf ? And yet I am not conscious that any great change in character or temperament has worked within me since the day on which I left the service of a commercial company ; nor have I observed any marked metamorphosis in the virtues and faults of old colleagues. The twenty thousand or so of us who came over in company, are, generally, still responsible each in his or her degree for the well-being of the telephone service : and it is scarcely imaginable that this army of workers of varying types, the zealous, the luke-warm, the conscientious and the careless can have been so influenced by new surroundings as to change entirely their habits and outlook.

Digitized by Google

Moreover, as I came to know my new chiefs and colleagues, I could discover no great difference between us. Without disparagement of or disloyalty to the company the Civil Servant struck me in an average sense as taking his work a thought more seriously and earnestly than is the custom outside. That is to say, while in an ordinary business concern the higher the post the greater is the sense of duty and responsibility, expected and existent, this sense was noticeable to me as a newcomer to the Post Office in every grade from top to bottom—a higher level throughout, in fact. And I attributed it largely to the training and reasoning of the mind which the necessary preparation for examination incumbent on the Civil Servant involves.

And the common training and competitive system have another excellent result foreign to conditions under which entry into a business concern is effected by influence or haphazard introduction. It promotes an atmosphere of mutual confidence and equality—the main dividing factor being experience—it diminishes the formal distance between the chief and the capable subordinate, and encourages the expression of opinion, without timidity, in the certain knowledge that at least it will not be ignored. The method by which the veriest junior is able to append his initials to any document of which he is the originator is a distinct advantage to him if he is intelligent, and to the administration if he is not! It would have been far easier to suppress rising talent or to pick the brains of the reticent and self-diffident in the Telephone Company than it is in the Post Office.

The popular picture of a servant of the State lounging to his work at mid-day and leaving it in time for a stroll in the park, is as obsolete as any Victorian fashion plate. Fifty or sixty years ago when places could be bought or secured by favour there was doubtless some truth in this libel; otherwise the observant Dickens would not have exercised his humour upon it. Were Dickens alive to-day he would probably have striven to correct his impressions, as he did of the Americans on his second visit to the United States after a gap of many years. But Dickens is still read, and any tale, no matter how grotesque and exaggerated, penned by such a convincing genius, may survive the ages. Incidentally, Thackeray with his "Tape and Sealing Wax Office" toyed delightfully with the subject, but with a lighter touch; while with Balzac the French system was a minute study—tragedy and comedy alternating and commingling.

It was a new experience for me to hear of a man absent from work by reason of a nervous breakdown. I can remember no such case in all my years of service in the company. There were, of course, many enthusiastic men there who lived for their work and almost for that alone; but their way was comparatively smooth and their interest unenforced, and there were goals to be reached undreamt of in the Civil Service. The work of the telephonist in an exchange would seem to be typical of that of the earnest Civil Servant, a life of continual tension, strain and distraction, and unfortunately it is usually the best men who suffer most in this respect; for from nervous disorder the careless and the incompetent are happily immune.

There is no very high reward to be gained by this incessant and laborious grind at the official mill; there is no chance, for example, of buying a new motor-car on the proceeds of the satisfactory issue of a difficult and complicated piece of business; the Civil Servant can hope financially for no more than that he may live without undue anxiety, give his children an education at least equal to his own, and thus perpetuate a class which for high principles and unassailable integrity is unrivalled throughout the world. He is not called upon like the ordinary business man to drive bargains or to go on "Change" or to float companies, but to perform services for the public quietly, patiently and impartially, without fear or favour.

In writing this article for our JOURNAL—contemplated long before the Civil Service was the subject of widespread attention, and certainly with no reference thereto—I have had but one object in view; to indicate, however imperfectly some of the differences between and the similarities of State and private service, as they present themselves to me, and incidentally to take the opportunity of placing on record some acknowledgment and appreciation of the courteous and friendly welcome with which we of the National Telephone Company, an outside body, were received by our future colleagues (who had nothing to gain from our irruption) in the Post Office some ten years ago; of the easy assimilation which then took place and of the mutual good feeling which has since prevailed, I have left much unsaid, for the subject is exhaustless.

For what they are worth I have merely put on paper the outcome of my independent observations. I have no axe to grind and nothing to gain from doing so; for, as I have already hinted, my telephone career is drawing to its close and my part in the future development of the service must be a small and a short one.

But, after all, there may be much ado about nothing; for if we were all stripped, Civil Servant, business man, doctor or bishop, we should no doubt be found to be very much alike.

MR. MORTEN'S COLLECTION OF HISTORICAL POSTAL ITEMS.

MR. W. V. MORTEN, District Manager of Telephones at Nottingham, retires at the end of the year. As many of our readers are aware, he is the possessor of a unique collection of historical documents, pictures, seals, stamps, and other items illustrating the gradual development of the post and other modes of communication. An exhaustive article which he published under the title of "Communication" in the old *National Telephone Journal* will be still fresh in the minds of many subscribers to that journal who are also subscribers to this. It was a mine of curious and interesting information, much of it first hand and drawn from Mr. Morten's exclusive store of knowledge.

A bare recital of some of the principal treasures in the collection will give some idea of its valuable nature.

It comprises many early documents, for instance a list of fees paid by Lord Thurlow, who was a Postmaster-General, for his release from prison; the receipt for the repayment of the money borrowed by King Charles on the Crown Jewels from Philip Berlimachi. Berlimachi was given the Post Office as part remuneration. It comprises also the accounts of Queen Elizabeth's Sub-Postmaster for riding with her letters; and a cover of a letter from the Conway papers from Queen Elizabeth with her Tudor Rose seal unbroken.

On Postal agitation, Mr. Morten has numerous contemporary pamphlets, caricatures, broadsides and literature; the autographs and portraits of a great number of the earlier Postmaster-Generals from the 1600's; and a Royal Black Letter Proclamation "for quieting the Postmaster-General in his office," of which only three are known, Mr. Morten's copy being from the Earl of Crawford's collection.

Of road books and maps, the collection includes that issued by Cromwell for the use of his army; an earlier one which enables anyone to "coast all about England," and one for about every ten years to the present time, which in sequence illustrate the alterations of the routes and the roads throughout the British Isles.

The collection could illustrate with coloured prints, broadsides, &c., a journey from London to Paris, and through the Mt. Cenis tunnel to Brindisi, with various items—for instance, the original account book of the Dover Coach, showing the passengers and goods carried (in some cases of the former marked "ran away"). It contains the Visitors' Book of the Hotel de L'Europe, Abbeville, just after the Battle of Waterloo, with the signatures of the Duke of Wellington, Kings, Dukes, Isaac Disraeli, Mrs. Fitzherbert, and hundreds of other well-known people; a large volume of Mail Coach way bills written up by the Inspector, Thos. Hasker, for Lord Chichester, the Postmaster-General, with Hasker's autograph remarks on the working of the coaches; the Log of the Seagull Post Office Packet during the American War; and the original large oil painting by Samuel Drummond, A.R.A., of Capt. William Rogers fighting on board the Windsor Castle Post Office Packet

The items relating to each of the Post Office Departments are arranged together and in sequence. In most cases a *precis* has been written.

Mr. Morten also possesses lectures and numerous lantern slides, hundreds of other coloured prints, and blocks made ready to illustrate the various histories, which, without further labour, would fill a magazine for years.

Lastly, in Criminology, the collection is particularly strong.

The collection would form a very usual nucleus of a Post Office Museum, concerning which we have recently heard various suggestions.

HOW THE TELEPHONE WORKS.

By A. CROTCH.

II.

THE natural sequence of matters now brings us to the receiver. It is so well known that a description is almost superfluous. Briefly, it is a horse-shoe magnet with a pair of soft-iron pole-pieces, on each of which is wound a coil of insulated wire. It is directly comparable with the magnet shown in Fig. 1. The armature or keeper, however, consists of a diaphragm or thin disc of soft iron. Imagine the earcup to be removed: we can slide-off and replace this disc, and these movements are directly equivalent to the taking off and putting on of the more robust armature of Fig. 1. Further, with the coils joined up to a suitable galvanometer (the horizontal uni-pivot instrument used with the Wheatstone Bridge is highly suitable) we can repeat the experiment. If we slip-off the disc as sharply as possible, a momentary current will pass through the circuit and deflect the galvanometer needle to one side. If we put the disc *on*, again as sharply as possible, another flick of current, in the opposite direction, will be indicated by the galvanometer.

Further, without actually removing the disc, we can show that a to and fro movement of its central portion will result in pulsations of current. The disc is very near, but does not touch, the pole-pieces—touching would be fatal. It is subject to the powerful pull of the magnet but has sufficient room to move towards the magnet. If we give the disc a smart (but not ungentle) pressure with the end of the finger, the galvanometer needle is affected and in the same direction as that produced by the putting on of the disc. If now we allow it to move outward, a pulsation in the opposite direction will be generated. The currents due to these movements can just be detected by the instrument mentioned.

Now let us imagine our receiver to be firmly fixed and that in front of the disc a tuning fork is sounding. The movements of the latter consist in alternate approach of the prongs to each other and their receding apart. This means that when the prongs move outward, away from each other, the air particles in the vicinity receive a push or are jammed together—if one may speak thus of such a delicate movement. When the prongs approach each other this pressure is relieved and the air particles have a "little more room" than normal and move in the opposite sense. Thus, whenever a sound is being produced, a series of "condensations and rarefactions" is set up. Also, depending upon the pitch of the fork these vibrations will succeed each other at a definite rate. With a fork of low note the number of vibrations set up in a given time will be less than that set up by a fork of higher note.

These alternate pushes and recessions are communicated by the air to the disc and the latter is pushed in and out in obedience to them. That is, the disc moves in and out at a similar rate to that of the fork. In its movements it sets up a corresponding series of impulses in alternate directions. The rate, however, at which they succeed each other is much too high to allow the galvanometer needle to follow them.

But, instead of a galvanometer, imagine a second receiver to be placed in circuit, with the connecting wires long enough to allow it to be out of direct hearing—say in another room. If now we pull off the disc of the first, the pulsation of current set up in its coils will traverse the coils of the second receiver. Imagine the direction of this current to be such that it augments or strengthens (while it lasts) the magnet of the receiver: then the second disc will be drawn closer to its magnet, *i.e.*, it will move inwards, owing to the increased attraction, returning to normal as the impulse dies away. If the first disc be sharply replaced, a pulsation in the opposite direction will be set up and this will weaken the pull of the second receiver on its disc. The latter, by virtue of its own elasticity, will move outwards. It is easily seen that if the excited tuning fork be placed before the first disc, the currents set up and passing round the coils of the second will cause the latter to vibrate and to emit the same note. If a higher note be used, the rate of vibration will be increased, the number of pulsations generated will be increased, and finally, the rate of vibration of the second disc will be increased.

On a microscopic scale, then, the first receiver becomes a magneto-electric generator: we supply it with mechanical energy in the shape of sound, which energy the apparatus transforms into alternating currents of electricity. These currents passing through the second receiver are transformed into mechanical energy and given out in the form of sound. The second thus becomes, on the same delicate scale, an electric motor.

But the fork may be vibrating gently or violently, giving out a soft or a loud sound, but of the same pitch. This means that the first disc will vibrate with a certain moderate amplitude or with a more extended one. These differences will result in currents, of lesser or greater strength and these, in their turn, will cause the second disc to vibrate over a smaller or larger arc and thus give out a softer or louder note. The pitch, of course, remains the same with the same fork. Thus we see that sounds of different pitch and of different strength can be reproduced, and by apparatus so

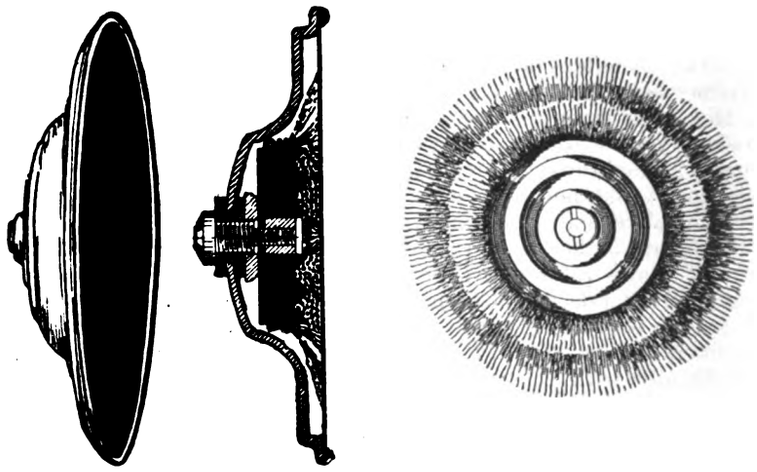

FIG. 4.

essentially simple. In the light of this, it will not appear much more wonderful that the delicate differences of the quality of sound should also be reproduced, and finally, human speech.

In these little experiments, the first "receiver" is of course acting as a sender or transmitter; the second is performing its usual function. But this is the order in which the successive discoveries were made.

Transmitter.—It will easily be seen that the energy given out by the sending disc, in the form of currents, is a fixed quantity and that very small. Hence as soon as the connecting wires become of any great length and the resistance of the circuit rises, the currents set up become too feeble to actuate the receiving disc. It is as if we were making some exquisite photographs on a very small scale, too small for the naked eye, so that a magnifying glass becomes necessary. The transmitter and its accompanying apparatus serve the purpose of this magnifying glass.

It is the peculiar property of carbon that its resistance varies with pressure. If two pieces of metal, say, are in contact with each other, the contact is either a good or a bad one. But with two pieces of carbon in contact, the resistance of that contact will vary between very wide limits as the pressure keeping them together is varied. The microphone of Professor Hughes is the classic example of this. A simple pencil of carbon bridged a pair of carbon blocks, the two ends lying loosely on the blocks. The whole was mounted

Digitized by Google

on a thin board or diaphragm and the slightest disturbance, due to a fly walking across the board, or to a sound uttered near it, was sufficient to cause an alteration in the resistance of the combination. This gave way to a number of pencils, offering a multiplicity of contacts and at the present time the pencils have been entirely replaced by a quantity of carbon granules offering an almost infinite number of contacts.

As the transmitter is a piece of apparatus not usually get-at-able, Figs. 4 and 5 illustrate the two principal forms in use.

Fig. 4 shows the form usually employed on primary or separate battery circuits. It is made up in this " capsule " form so as to be readily replaceable when faulty. A box of thin brass is shaped as shown and its front is formed by a thin disc of carbon secured into the box by being spun over. At the back, or deeper part of the box, a circular block of carbon with front shaped as shown, is fixed and provided with an insulated lead through the back to a kind of terminal button. Round the edges of the carbon block a fringe of woollen material is fixed and this forms the sides of an inner receptacle whose back is the carbon block and whose front is the carbon disc. Between the two latter a quantity of the carbon granules are placed. The complete capsule is placed so that the disc faces the speaker. Under a compression the disc moves inward

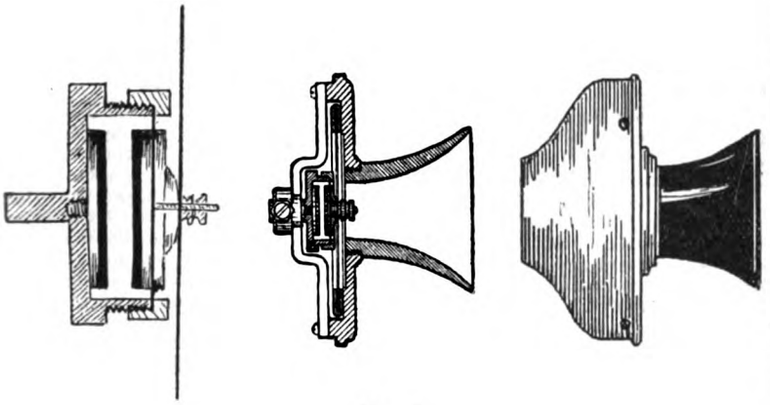

FIG. 5.

and sets up a tighter packing of the granules, thus lessening the resistance between disc and back block. The movement due to a rarefaction allows the disc to move outwards, thus lessening the pressure and causing the resistance to rise. These movements, of course, vary in their rate and amplitude of motion and also in their character.

The function, then, of the transmitter is to set up variations of resistance in a circuit. With a fixed EMF, as furnished by an ordinary battery, the current in such a circuit will vary inversely with the variations of resistance. These variations will have the greatest relative effect when the transmitter itself is the only resistance in circuit. Hence the resistance of the circuit in which it is placed is kept as low as possible, as we shall see.

The transmitter shown in Fig. 5 is that used for common battery working. The complete instrument with its mouthpiece is shown to the right, a section of the essential parts in the centre and on the left an enlarged view of the latter.

A circular brass box has for its cover a disc of mica, clamped in position by a ring. On each side of the mica a circular brass plate is securely fixed, the outer one terminating in a threaded pin. On the inner side the brass plate is faced with carbon and a similar plate, similarly faced, is screwed to the bottom of the box. These two carbon surfaces, highly polished, face each other and between them is a quantity of polished carbon granules. The circular sides of the box are covered with paper so that the electrical passage through the box is entirely from one plate to the other *via* the granules. By means of the threaded pin and a couple of tiny nuts the outer combination is secured to the front diaphragm. When the latter vibrates, the outer plate moves with it and thus takes up the maximum movement, *i.e.*, that at the centre of the diaphragm.

Induction Coil.—This is based on the same principle as the calling generator and the receiver, as will easily be seen. In Fig. 6

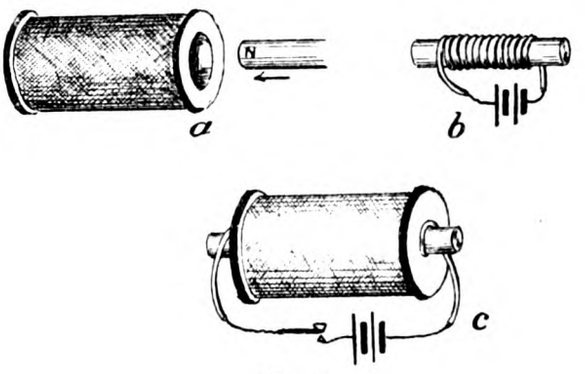

FIG. 6.

we have a large hollow coil of very fine insulated wire. If we thrust the permanent magnet sharply into the interior of the coil, its lines of force will " cut " the wires of the coil and induce a transient current therein, assuming that the coil is part of a closed circuit. The sharp withdrawal of the magnet will set up a reverse current.

Instead of using a permanent magnet we can use an electro-magnet, as at *b* in the same figure, and with the same results.

But imagine the electro-magnet to be permanently fixed inside the large coil, as at *c*, and a key placed in the former circuit so that we can make and break it at will. When the key is put down. the current flows and the core is magnetised. The magnetic lines in coming into existence cut the outer coil and set up a momentary current. It is indeed equivalent to thrusting in the magnet. Similarly the breaking of the circuit has the same effect as the withdrawal of the magnet: the lines collapse and cut the coil in an opposite sense and a reverse flick of current traverses the outer coil.

This is precisely the arrangement of the induction coil. The core is of fine iron wires, to facilitate changes of magnetism; over

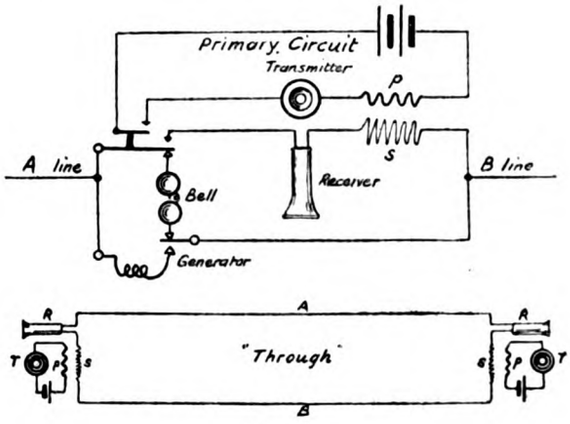

FIG. 7.

this is the first winding or primary, and over this in its turn, the secondary or outer winding is placed. As to the number of turns of the two windings, the ratio between these is of the greatest importance, and here is the true magnifying effect of which we have spoken. If both coils have an equal number of turns, the EMF induced in the secondary by a certain current in the primary, will have a certain value. If the secondary has double the turns of the primary, this EMF will be practically doubled; if it has ten

Digitized by Google

times the number the effect will be increased ten times, that is, speaking quite loosely and without taking into account certain modifying factors. This is the magnifying effect of the coil. In the coil commonly used, the primary and secondary have a resistance of 1" and 25" respectively, with a ratio of 1 : 3 in the turns.

The primary winding is connected with the speaking battery and the transmitter: this constitutes the primary circuit. The secondary is in series with the receiver (for reception) and the line. Normally, therefore, a steady current flows through the primary circuit, but the secondary is perfectly quiescent. When speech is uttered before the transmitter, the resistance of the latter is at once subject to variation and the primary current becomes a varying or undulatory one. Every variation sets up a change in the magnetic field and these variations are magnified by the secondary of the induction coil and pass over the line to the distant receiver, there to reproduce the original speech.

Fig. 7 shows the connecting-up of the different parts, and the lower portion of the figure shows two telephone stations "through" to each other.

(*To be continued*).

TELEGRAPHIC MEMORABILIA.

A C.T.O. enquirer asks for the origin of the indication "P.Q." given to the French Atlantic cable route. These letters stand for Pouyer Quertier an ex-French Minister of Finance, a successful dealer in cotton and a notable personage in Parisian financial circles, in the seventies of last century. He it was who, under the influence of a persuasive French ex-cavalry officer of Irish origin named Dillon, but one whose efficiency as an administrator and scientist was undeniable, financed the laying of a trans-atlantic cable from Brest to New York in 1877 or thereabouts. P.Q., however, nearly wrecked the scheme, despite his financial genius. There was a woman in the case! According to Mr. Roland Belfort it happened thus: P.Q., about this time was taking a very tender interest in a young comedienne who much wanted Quartier to quit Paris. Ignoring the fact, and against Dillon's advice, that that particular moment was one quite unfavourable to the flotation of the company from a Bourse point of view, he insisted on rushing the flotation through so that he might leave the French capital without further delay. The flotation was a failure and it was only by the superhuman efforts of Dillon that the scheme was re-organised and one cable laid and successfully worked in 1880.

During the month of September two delegates from the Czecho-Slovakian administration, M.M. Kucer and Strnad, paid official visits to the C.T.O. and various other departments of the British Post Office specially interesting to telegraph and telephone engineers and administrators.

The retirement of Mr. Hartwell, overseer, was made in particularly sad circumstances, and these lines are an attempt to collectively express to this worthy and much-respected member of the supervising staff the sincerest sympathy of his Cable Room colleagues of all ranks.

A congratulatory paragraph had been written on the recent visit of Mr. James Fraser, late Executive Engineer at Aberdeen, to the C.T.O., where a host of old friends felicitated him upon his twelve months of retirement from the service. Alas, within but a few days the note is changed to one of poignant grief, for the news reached us that our old friend passed away suddenly owing to heart failure, very soon after his return to his beloved Scotland. The printed word is but a cold medium in which to express one's appreciation of so kindly and so sterling a character. As an official technological examiner he performed that duty to the Department with a blunt honesty which all men appreciated, but certainly not without a touch of the milk of human kindness. Few however realised how keen and personal was the pain of another's defeat when that same duty demanded that he should be the one to write against a candidate's name "Not Qualified." To his wife and daughter and his brother Andrew, the C.T.O. tenders its respectful sympathy on the passing of one of God's good men.

It is noted that "A Constant Reader" and other correspondents in the daily press have lately been attempting to mould the English language to their will by suggestions for substituting one or two new words in connexion with radio telegraphy and telephony. Among the more or less beautiful productions are *airophone*, *airograph*, *earthophone*, *earthograph*, *etheraphone* and *etheragraph*! It seems rather late in the day to invent a new nomenclature when other words have had time to become well current in the common speech of the man in the street, but what do our readers think of the above?

Congratulations to Mr. A. E. Tanner, of the Cable Room, upon his appointment as an Assistant Traffic Inspector of Telephones in the Canterbury district. As local secretary of the U.P.W. Mr. Tanner has proved a specially tactful and helpful representative without yielding a single point on any principle which appeared vital.

The Engineer-in-Chief must have rubbed his eyes one evening in October upon reading the latest sheets from Fleet Street to learn that "The laying of a new cable from Eastbourne to Dieppe at present being carried out is an event that recalls . . ." As a matter of fact the work upon which the cable ship was at the time occupied was a simple diversion of submarine cables laid many years ago from their old cable hut at Birling Gap near East Dean to a new and more convenient landing place at Holywell, a spot well-known to most visitors to Eastbourne.

The hut at Birling Gap was in a very isolated spot, the overhead land lines from Polegate to the Gap were very exposed, and the new arrangement by which the London-Continental wires now pass through Eastbourne and thence by means of underground lines into the Holywell hut, where they are linked up with the respective French cable cores, is obviously a great improvement and should give additional stability to this route. It is somewhat of a miracle that the old Birling Gap shanty was not itself washed away long before this, and it is probable that had the war not intervened the much-needed removal would have been effected a year or two ago. It was no enviable post during the years of 1914-18 for the lonely watcher to sit in that tiny building on stormy nights, the waves washing away the beach steps, at its rear, while thundering on the roof and pouring down showers of salt spray and water in front of the only possible exit!

Perhaps we may encroach upon Telephone ground to congratulate our colleagues of the Anglo-Continental Telephone Service upon the steady progress made with the Anglo-Dutch trunk circuits. It is understood that Utrecht and Gouda are perfectly good extensions from The Hague and that Ymuiden and Bois-le-duc may follow shortly, probably *via* Amsterdam.

From information received from Germany and also through the medium of the columns of *Telegraphen und Fernsprech Technik* it is ascertained that something more than the mere nucleus of a large Transradio Central Office has been opened and is now in full swing in Berlin. Here the huge transmitting station of Nauen and the terminal reception station of Geltow are associated. The central control is lodged in Post Office 24, hard by, and is thus in close contact with the wireless section of the H.T.A. (the Berlin C.T.O.). As the principal wireless station, Königswusterhausen, and its receiving station, Zehlendorf, are also controlled by the H.T.A., Berlin, it will be seen that a co-ordination of the wireless services has thus been obtained by the opening of the Central Transradio office.

All radio telegrams are forwarded to this Government wireless centre, European wireless traffic being dealt with by Nauen as well as by Königswusterhausen. By means of the concentration of both wire and wireless services considerable acceleration of wireless traffic is anticipated. The arrangement, so it is gathered from the report, has so far developed that the wire and wireless systems are practically working side by wide, the Transradio Centre with its apparatus even "intruding" into the space normally allocated to wire telegraphy. This, however, concludes my informant, only means the closer co-operation of the wire and wireless systems. In this last observation undoubtedly lies the key to the future position of wireless, *i.e.*, a weaving into the extant land and subaqueous systems of all radio communications. One can see the beginning of the evolution already. Most of the wireless systems and station now in existence may best be considered as experiments, as first steps in the evolution of a new branch of the telegraphic art, the future of which none can foretell but the present tense of which is definitely expensive. At the moment most long-distance stations need the help of wire systems. The problem of the immediate future will therefore doubtless be as to where exactly radio circuits may prove the most useful adjuncts to land and submarine communications. No one has so far attempted to show that from a cost accountant's standard any present wireless circuit is a paying concern. That is to say, political considerations or national exigencies apart in no single journal in any part of the world has it been contended that this or that particular wireless station has proved anything other than a debit. MM. H. Abraham et R. Planiel in *Le Journal Telegraphique*, the official organ of *Le Bureau International de l'Union Telegraphique*, scientifically examining systems applicable to wireless telegraphy in order to increase output, declare that:—The future of long-distance wireless essentially depends upon the methods that may be discovered in order to increase the output of large wireless stations. *L'exploitation de ces grands postes restera en effet deficitaire tant que l'on n'aura pas trouve le moyen de leur faire debiter un trafic considerable*, the receipts of which will be able to exceed the enormous cost of power, of staff and capital charges necessary for the working of a high-power station.

It is to the interest of wire and wireless telegraphy alike that these means of obtaining increased output should be found if they are to be interlaced into the national and international telegraph systems of the world.

The same journal notifies the interesting fact that Palestine has affirmed adherence to the International Telegraph Convention.

A trial with the Siemens' Halske printing telegraph was made between Leipzig and New York during the latter half of September, by means of the high-power wireless station. The test it is understood, was made for the special benefit and education of the Natural Scientists Convention. The test only lasted fifteen minutes but a speed of nearly 800 letters per minute was successfully attained and worked.

It will interest all who are desirous of keeping *au courant* with the development of printing telegraphs to know that a short series of well-illustrated articles on The Teletype was commenced in our contemporary *Electricity* in the issue of Sept. 29.

The article on the North Walsham Repeater offices recently reproduced in these pages brought to our minds in London the fact of how little the work of a repeater officer is appreciated, especially by those who have never had to stand at a repeater for an hour on end trying to make a circuit "go."

Digitized by Google

It is a nerve-racking job at best and if one may say as much without offence to our foreign neighbours it is more especially so when the difficulties of international circuits are taken into consideration.

The adjustments at a repeater office of the standard and duties of North Walsham or Lowestoft, for example, are not a mere matter of "a little more marking" or a "little more spacing" and off we go! They are something much more tiresome, much more difficult and much more irritating than that! We shall therefore do well to give a kindly considerate thought sometimes to that other man's job away down in obscurity!

Via the South African Telegraph Service comes the following:—An Indian postal and telegraph exchange journal advertises a "charm" which is apparently guaranteed to cure "heart disease and double pneumonia." Other virtues it is stated to possess may be judged by the testimonial of an alleged purchaser who gratefully writes:—"I am pleased to say I have had promotion by wearing your Talisman!" Service papers, please copy!

From East of Suez we learn that Siam is up to date and uses electricity. The company supplying the necessary current provides the following printed notice, a sample of which may be seen in every room of a Bangkok hotel. It reads:—"Sir,—For the case that your electric light should fail, we beg to send you *enclosed* a post-card which please send us at once when you find your light out. The company will then send you another post-card."

Engineers of the earlier days of telegraphy and telegraphists of a like period will be pleased to read that Mr. Oliver Heaviside, F.R.S., was recently presented with the Faraday Medal of the I.E.E. Mr. J. S. Highfield, the President of the Institution, went down specially to Torquay to hand over the coveted honour.

The "understanding," "alliance," "agreement," or whatever it may be called, between the Postal Telegraph Company of the U.S.A. with the All-American Cables Corporation is probably the biggest telegraph combination of the present century. The total length of submarine cables involved is estimated to be between forty and fifty thousand miles. Until quite recently the "Postal Company," as it is locally termed, were conspicuous in America as having refused to adopt any system of high-speed type-printing telegraphy, relying upon the simple sounder to deal with all their traffic. It is understood from those who have visited the States recently that there has been a movement latterly in the direction of more modern appliances. The fact, however, remains that they have hitherto held their own with the more simple type of apparatus. This appears to be explained by the circumstance that the "Postal" company's system deals with a very different type of traffic from that of the Western Union who, as is well known, have made a fine art of the high-speed machine telegraphs.

From Helsingfors we learn that telegraphic communication between Norway and North Russia *via* Petsamo has been established. Also that a telephone circuit is in operation between Kirkenaes (Norway) *via* Petsamo to Vaida Guba in the Fiskar Peninsula. Petsamo is apparently the Finnish equivalent for Petchenja as is also Fiskar for Rabachi. Petchenja will probably be recalled as the ice-free port ceded to Finland, hence the importance of the communication.

Sixty Years Ago:—A new and important discovery in electricity!

"A wonderful discovery is reported to have been recently made in electricity as applicable to the purposes of the electric telegraph. Incredible as it may appear, it is said that experiments have established the fact that intelligible signals can be exchanged between distant stations without the intervention of any artificial conductor whatever, and that with equal success, whether the intervening space be wholly or partially land or water.

The *modus operandi* has not been disclosed, but the promoters of the new system believe it to be a reasonable expectation that this discovery may render unnecessary any future attempt to lay an Atlantic cable. Many years ago this achievement was regarded by some scientific men as a speculative possibility."—*Cassel's Illustrated Family Paper*, Dec. 13, 1862.

J. J. T.

CORRESPONDENCE.

RECORD TABLES.

TO THE EDITOR OF "THE TELEGRAPH AND TELEPHONE JOURNAL."

SIR,—In an article contributed to the September number of the JOURNAL on the subject of "The New Record Tables" at the London Trunk Exchange, Mr. Kennedy refers to the introduction of the arrow head ticket for use on the pneumatic tube system and adduces as the reason for adopting this design of ticket the fact that additional impetus is given to the ticket by the extra sail. Perhaps I may correct this misapprehension.

The tests made on the experimental tube were unsatisfactory, and as a consequence the Department was unable to proceed further with the installation of a new tube system. This incidentally arrested any progress in the preparations for the transference of the record work from the Trunk Exchange.

Investigations into the cause of the failures were pursued, and it was demonstrated that the stoppages usually occurred at the flat bends of the tube. The following explanation of the causes leading to the tickets being delayed in transit was then deduced.

On a ticket approaching a bend, the normal tendency is for it to travel in the line continuing the direction of its motion in the straight length of tube preceding the bend. The ticket consequently moves to the concave face of the bend on the inside of the tube. At this point the components of the air forces acting normally to the surface of the tube increase the tendency of the ticket to adhere to the tube. The surface of the ticket may lie as a chord to the arc of the bend, or its flexibility may be such as to allow it to conform completely to the inner surface of the tube at that point. The end of the ticket is depressed on the inner surface of the tube so that the flow of air between itself and the concave surface of the tube is prevented. If the single sail of the ticket is adjacent to the concave surface of the tube it becomes ineffective and the ticket may remain stationary for long periods while other tickets continue to traverse the full length of the tube. It may of course actually result in a complete blockage of the system by the accumulation and wedging of tickets at the bend.

The aim in modifying the design of the ticket was to ensure that whatever be the position of a ticket in the tube at any moment one or more driving surfaces upon which the air pressures would impinge should always be available to the driving air current.

It was for this reason that the arrow-head ticket was designed and introduced. The resulting reduction in the frictional losses which retard the rate of transit were incidental, though of importance on long tube systems with a considerable lift. The arrow-head ticket passes through the tube with only the edges of the flaps bearing against the surface of the tube, the main portion of the ticket being supported free from the surfaces of the tube. The use of a much cheaper class of paper is consequently possible with this modified pattern of ticket.—Yours faithfully,

H. P. BROWN.

Engineer-in-Chief's Office, Sept. 30.

THE FIVE-UNIT SYSTEM.

TO THE EDITOR OF "THE TELEGRAPH AND TELEPHONE JOURNAL."

DEAR SIR,—If Mr. Polley will read into my "startling statement" what it was intended to convey—and it appeared to be thoroughly understood by those attending the lecture—he will know that if a Wheatstone transmitter and a Baudot were sending out reversals at an equal rate, their relative speed of working would be as 82.5 is to 120 words per minute. A quadruple Baudot running at 180 revolutions per minute is working *at the rate* of 120 words per minute whether 1, 2, or more arms are used. After my explanation that "it is not claimed that 120 words per minute is obtained in actual working . . . with the 5-tapper keyboards and a distributor speed of 180 revolutions per minute."—Yours faithfully,

W. T. COUSINS.

C.T.O., Sept. 20, 1922.

ABOUT SUPERVISION.

BY H. MORGAN (*City District Contract Officer.*)

SUPERVISION is more than the art of getting things done. As wisdom is the ability to utilise knowledge, so supervision includes the adaptation of the knowledge of how things *should* be done, to the art of getting them done.

Supervision should be consultative rather than autocratic.
Sympathy is essential to successful supervising.
Dignity of control is not divorced from fraternal deportment.

The function of the supervising officer is to supervise, this fact is not infrequently overlooked.

Conscientious oversight ensures the forward flow and easy progress of the work carried out by the branch or section supervised.

Authoritative direction should characterise superintendence.
Chronology should be a strong point with the officer in charge.
When all men speak well of him the supervisor should go cautiously.

"Easy-going" is a label which should be a libel so far as he is concerned. It is indicative of laxity when applied to the overseer.

Conversely he's a bad boss of whom nobody says anything good.

True justice never adjudicates blindfolded. He who holds the supervisory balance between employer and employee needs incisive discernment.

The keystone of the arch of efficiency is supervisory reliability.
Supervision that counts is causal not casual.
It is not politic to "standardise" oversight.

Lack of initiative is closely related to irresponsibility. Resourcefulness and responsibility come of the same stock.

Decision should denote discerning decisiveness.
Conclusions clearly conceived carry conviction.
He who gives decisions is he who has decisions to give.

The pulse of the Department is its post-bag. Generally speaking, people put on paper opinions worth perusing when the subject is commercial in character.

The
Telegraph and Telephone Journal.

PUBLISHED MONTHLY IN THE INTERESTS OF THE TELEGRAPH AND TELEPHONE SERVICE, UNDER THE PATRONAGE OF THE POSTMASTER-GENERAL.

Editing and Organising Committee - - - J. STUART JONES. JOHN LEE. J. J. TYRRELL. W. A. VALENTINE. J. W. WISSENDEN.

Managing Editor - - W. H. GUNSTON.

NOTICES.

As the object of the JOURNAL *is the interchange of information on all subjects affecting the Telegraph and Telephone Service, the Managing Editor will be glad to consider contributions, and all communications together with photographs, diagrams, or other illustrations, should be addressed to him at G.P.O. North, London, E.C.1. The Managing Editor will not be responsible for any manuscripts which he finds himself unable to use, but he will take the utmost care to return such manuscripts as promptly as possible. Photographs illustrating accepted articles will be returned if desired.*

VOL. IX. NOVEMBER, 1922. No. 92.

ANGLO-CONTINENTAL TELEPHONE COMMUNICATIONS.

WE recently recorded the opening of a direct telephone circuit between England and the Netherlands, and during October a second line was brought into use. Communication is now obtainable with Amsterdam, Rotterdam, The Hague, Utrecht and Gouda, and will be extended to other Dutch towns. The first line was no sooner open for public service than it was filled up and, indeed, overloaded with traffic; the second circuit has effected considerable improvement is diminishing delay on calls, and when the third (superimposed) circuit is ready, as it will be shortly, a very good service should be given. Thus rapidly does demand always overtake supply in international telephony. Times are greatly changed since officials feared that the language difficulty would adversely affect the traffic with foreign countries. Five lines to Belgium barely suffice to carry the calls made to Brussels and Antwerp, and the twelve lines to Paris and three to Northern French towns are inadequate for the Anglo-French traffic. On the Continent a system of "urgent" trunk calls has long been in vogue by which those who care or can afford to pay triple fees obtain priority over the ordinary caller. In some cases at least this has had the simple effect of trebling trunk charges, as calls booked at the ordinary rate stood no chance of being completed within reasonable hours. The objection to a sort of call *de luxe* would not be so patent if other calls suffered no inordinate delay, but where the latter are reduced to futility by the urgent call it seems to us that there are the gravest objections to the "urgent" system.

The present paucity of long-distance facilities in Europe is one of the *sequelae* of the War. Negotiations for direct lines to Germany, which probably would have been working long ere this, were of course discontinued in 1914. The original Anglo-Dutch cable was ready for laying in 1915 but as our readers are aware was diverted for War purposes. There are, however, hopeful signs of improved conditions in the not far distant future. Proposals have been received from Germany for the provision of direct communication with that country by means of a cable constructed on the economical principle of the East Prussian and German-Swedish combined telephone and telegraph cables. This project is at present engaging the attention of the Engineer-in-Chief and, while it would be premature to say more, it may be said that it is full of interesting possibilities.

The French Administration, we believe, have under consideration far-reaching schemes of trunk line development, including the provision, with the co-operation of the British Post Office, of additional cables to this country, and when these are carried into effect it is hoped that it will be possible to afford communication between England and the countries adjoining France, such as Luxemburg, Italy, and even Spain. Moreover, a project is under consideration for the early provision of a direct line, at least in the evening, between London and Basle, pending the completion of arrangements for a more satisfactory scheme of general service with Switzerland than that given when the Paris lines can carry it. Again, negociations are in hand with Belgium for the provision of an additional cable to that country.

Everything points to a notable increase in the facilities for communication between this country and Europe in the coming years. Long-distance lines, especially where submarine cables are involved, require an enormous outlay of capital; but, once the lines are laid, the gain both material and moral is great. Poor countries compared with this are bestirring themselves to provide and improve communication with their neighbours, for the international telephone has not only become an economic necessity but also a sound investment. To carry out elaborate schemes such as those projected will of course require considerable time, but the Dutch service will serve as an earnest of what will follow and we have every hope that the addition to the Anglo-Continental services will be continuous as years go on.

PROGRESS OF THE TELEPHONE AND TELEGRAPH SYSTEMS.

TELEPHONES.

THE total number of stations in use in the Post Office system on Aug. 31 last was just short of a million, viz., 999,430. Of this total 358,663 stations were connected with exchanges in the London telephone area, and 640,767 with Provincial exchanges. The number of new orders received during August was well up to the average of recent months, the net number of stations added during the month being 5,327. Since July 1 last, when the lower tariff for residence connexions was introduced, nearly 30 per cent. of the new orders received have been for circuits to private houses. As

Digitized by Google

the proportion of residence rate subscribers in the whole service is only about 23 per cent. of the total there are thus indications that the reduced charges will assist materially the development of this branch of the service.

The number of public call offices in use at the end of August was 15,755, a net addition during the month of 88. A substantial addition to the number of rural party line stations was reported during August, the total number of subscribers at the end of the month being 4,894 as compared with 2,522 a year ago.

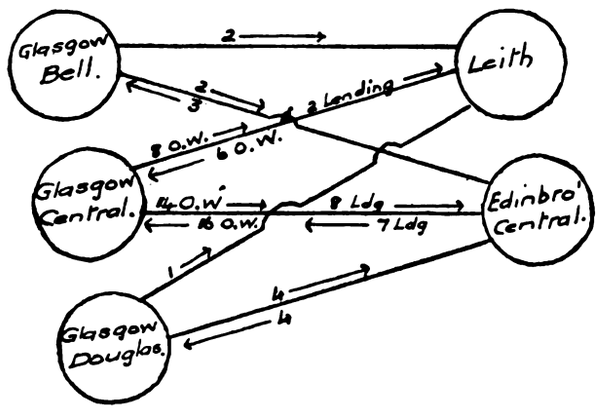
Further progress has been made with the development of the local exchange system. Among the more important new exchanges opened recently are the following :—

London area.—Wallington.

Provinces.—Penarth, Inverness, Aldershot, Weymouth, Ramsgate.

The main underground trunk system has been extended by the completion and bringing into use of a new cable between Glasgow and Paisley.

TELEGRAPHS.



A divided Baudot installation connecting Newcastle-on-Tyne, Edinburgh and Aberdeen commenced working on Oct. 16, each office having two duplexed arms to the other two offices.

"NO DELAY" TRUNK SERVICE.

BY D. HOWIESON (*Glasgow*).

A FEW years have now elapsed since a "no delay" service on certain short-distance trunk routes was inaugurated in Glasgow, and it may be of interest to readers of the JOURNAL to have some of the outstanding points gleaned from the experience of working this arrangement put before them. At present the Glasgow "no delay" trunk scheme embraces direct communication by means of 270 short-distance trunk lines between Glasgow local exchanges and 28 surrounding towns over which a full "no delay" trunk service is afforded. (These figures do not include late "junction fee" lines now trunk lines.) In addition to the full "no delay" trunk routes there are lines from twelve surrounding towns to the Glasgow Central Exchange over which a partial "no delay" trunk service is given for incoming work to and through the Central Exchange.

The largest and at the same time the furthest distant group of lines worked on a "no delay" basis in the Glasgow district is the Glasgow-Edinburgh-Leith group. Besides order wires there are 77 lines in this group ; the route mileage is about 50 miles and the charge for a three minutes' conversation between 7 a.m. and 2 p.m. is 1*s.* 6*d.* The following sketch shows the allocation of the lines :—

Other fair-sized groups are :

Greenock 25 lines, Coatbridge 21 lines, Hamilton 21 lines, Falkirk 19 lines, Kilmarnock 18 lines, Wishaw 15 lines, Dumbarton 12 lines, Airdrie 11 lines, and Helensburgh 10 lines. The remaining places have 8 lines or less in the group.

The foregoing rough outline of the Glasgow arrangements will be readily comprehended as the "no delay" trunk scheme has spread to most districts. It is given however as bearing on the further remarks of this paper which may be divided into two phases, viz. :—

1. The efficiency of the "no delay" service.
2. The effect on the local service.

1. *The efficiency of the "no delay" service.*

In the first place the general telephone public has appreciated the "no delay" trunk service especially on the larger and busier routes, and many unsolicited encomiums have been received. There is no doubt that this service is a great boon to the business man in providing a quick means of communication by cutting out the circumlocution of passing through a trunk exchange. A commercial traveller stated that the Glasgow-Edinburgh "no delay" service saved him two hours per day and was the means of increasing his business. This is typical of the commendations bestowed by the public. It has also been the means of settling some long-standing grievances and brought good relationship between some subscribers and the Department. There is no doubt therefore that from the point of view of the telephone-using public the system is a great success and is appreciated.

From an exchange standpoint the "no delay" service on the larger groups of cable lines has been an unqualified success. Before the present trade depression curtailed the traffic, an average paid time per line on the Edinburgh and Leith circuits of 35 minutes in the busy hour was obtained over a period. This compares very favourably with the paid time obtained on the average trunk lines worked on a delay basis. It was feared at one time that the timing of trunk calls in local exchanges would be somewhat lax and that there would be a large drop in the percentage of calls of over three minutes' duration. Despite the fact, however, that the clocks in the Glasgow Central Exchange pulsate only once per minute, a recent check on the Edinburgh and Leith traffic showed that the percentage of calls over three minutes paid duration was 13. The holding time of the line per call on the Edinburgh group generally ran about 3 minutes before the increase of the rates.

The great gains on this service are the decreased operating value of the call, saving of switching points, and the decreased holding time of the subscribers' lines. If the advantages of reducing the number of switchings, the corresponding reduction in the liability to error, the reduced holding time of the subscriber's circuit and the controlling operator being in close proximity to the calling subscriber's home position be considered, the points in favour of local exchange control are apparent. Of course the expense of additional lines where a no-delay service is worked has to be taken into account, but in these days of cable lines a few additional circuits are not of such moment as the provision of aerial lines. Reckoning has also to be taken of the increased value of the local operators' work and the effect on the switchboard equipment. When these points are considered, however, there still appears to be a considerable advantage on the side of local exchange control.

A feature of the "no-delay" trunk service has been the absence of complaints from subscribers with respect to such calls. The only cases coming under notice are disputed calls where the local operator has mistaken the calling subscriber's number. Such cases are infrequent and the careful recording does credit to the local operators, who are sometimes working under the disadvantages of indistinct figuring on the subscriber's number plates.

A certain amount of difficulty has been experienced with the smaller groups of "no-delay" trunk lines, principally due to stoppages. The smaller groups are generally aerial lines, and as such, are liable to interruption. Where a group of four lines serves for a no-delay service, the stoppage of one circuit means a loss of 25 per cent. and causes a certain dislocation of the traffic during the busier hours. In this connexion it is considered that small groups of lines for a no-delay service should be worked both-way in order that stoppages may be compensated as far as possible and erratic traffic met. When the lines were in good working order, however, the traffic on the small groups was satisfactorily dealt with, and the bringing of such circuits underground should largely do away with stoppages. Some slight holding up of the local operators is experienced at times on "through" calls and calls to smaller exchanges, but compared with the large amount of traffic where the calls go through quickly and smoothly, the percentage of such cases is small, and when spread over the operators the effect is almost negligible.

2. *The effect on the local service.*

The "no-delay" trunk service in local exchanges affects the loads equipment and service in varying degrees according to the percentage of trunk traffic. Up to a certain point there is considerable saving effected by local exchange control of short-distance trunk traffic. When the percentage of trunk traffic, however, is high, or where there is a number of large exchanges in a town each having a fair percentage of trunk traffic, the position calls for other measures. In the former case there would be a large wastage of valuable subscribers' multiple through having to use a much larger number of "A" positions than necessary, and in the latter case the undue splitting up of groups of trunk junctions might be wasteful. In such cases the question of a "Toll" exchange has to be considered. Glasgow is favourably placed in connection with the "no-delay" system of local exchange control in having a large percentage of the trunk users in one exchange. Practically all the short-distance trunk lines are in the Central Exchange, and the groups are therefore not split up, the only exceptions being a few lines between

Digitized by Google

Edinburgh, Leith and Greenock, and Glasgow-Douglas and Glasgow-Bell Exchanges.

The question of the effect on the actual service is a vital one. The desideratum in a local exchange in order to give an even and rapid service is to have the calls as simple as possible—all local calls would be an ideal state. When difficult junction and trunk calls are involved, the matter becomes more complicated, and the introduction of the no-delay service has added therefore a certain additional amount of complex working. It has been found, however, that in the cases of the larger groups of cable lines the calls are rapidly disposed of, in fact the actual operating is easier than on small groups of local junctions. It may be said that in the case of Glasgow-Edinburgh calls, with the exception of ticketing and timing, the operating of the calls is quite as expeditious as that on calls to the larger Glasgow local exchanges. The ticketing and timing are to some extent overlapping work. Such eminently satisfactory results, however, are not obtained on calls to small towns on direct or indirect routes. Of course it cannot be expected that small exchanges can always give the same prompt attention as the larger exchanges. There is sometimes a holding up of the "A" operators when dealing with trunk calls to small towns or through trunk calls involving three or four switchings. If such calls occur in any numbers and on adjacent positions, there is a tendency to make the local service erratic with occasional long answers. When, however, the daily average time of answer is taken, it is generally found satisfactory, and a few long times of answer are nullified to a large extent by the calls of average time. If the loading of the exchange is judiciously worked out, giving attention to the incidence of trunk traffic, the local operators dealing with trunk calls should not materially affect the service, and any slight erratic time of answer would be more than compensated by the privilege of the no-delay trunk service.

CONTRACT DEPARTMENT ORGANISATION.

BY F. W. GEORGE (*Contract Manager, Brighton.*)

THE return of normal conditions in telephone development gives a fresh impetus to the activities of the Contract Department and the time is opportune for a review of the essentials of efficient and successful contract work. The recent instructions determining the basis on which new exchanges can be established afford the greatest opportunity the Contract Section has ever had of securing a comprehensive development of the telephone service throughout the Kingdom and should result in the opening of not merely hundreds, but thousands of new exchanges, opening up entirely new territory and pushing out the tendrils of the telephone system into practically every village and hamlet in the Kingdom.

The base of operations is the Contract Office. Space will not permit of enumerating the whole of the duties in detail but they may be summarised under general headings of:—Correspondence; statistical; preparation and checking of contracts; cessations, &c., and card indexing; the number of staff engaged being proportionate to the size of the district. In a well-organised Contract Office the Contract Manager is relieved of all minor detail, concentrating his efforts on the general development of the telephone service, the retention of existing business and development studies. Correspondence should be courteous, concise and conciliatory in tone and convey to the public a sense of confidence and efficiency. Statistical work, including preparation of returns, should be so conducted as to enable the Contract Manager at any time to see at a glance the progress of the district.

Card index work follows the general lines, but it is necessary to emphasise that a comprehensive and accurate card index system is a vital necessity to the Contract Section.

The office staff should be of good address, conciliatory in manner and capable of interviewing callers or dealing with telephone enquiries. In brief, all should specialise on new business and be "rate perfect."

The success of a Contract Department is dependent on expert direction and organisation, combined with commercial vision. Although the duties of a Contract Manager have been generally defined in the service instructions, they are amplified in general practice. A Contract Manager who occupies himself in small detail generally fails, as he has no time for his primary duties—the adequate development of the territory under his control—the efficient training of staff and the important development studies which require to be undertaken. He should possess an intimate and first hand knowledge of the whole of his district in order that he may effectively realise the possibilities therein and direct and assess the work of the contract officers. In a provincial district, apart from the large cities, a Contract Manager must necessarily travel considerably to keep in touch with the contract officers and new development, but this knowledge is invaluable, enabling him to visualise the territory covered and so ensure the comprehensive development of the district with an effective and flexible disposition of the canvassing force. In this district there are, in addition to the base, seven sub-centres staffed by one or more contract officers and each provided with an office and telephone service. A framed diagram is kept at district headquarters showing the lay-out of the district and the exchanges allotted to each contract officer, the list of exchanges being in pencil so that any alteration in territory may be neatly recorded. A progress report, as shown below, is also kept for the 150 existing exchanges and the date each exchange is canvassed is recorded, enabling the Contract Manager to see that no part of the district is neglected or overlooked:—

EXCHANGE PROGRESS CHART.

Name of Exchange.	Dates visited.				
Buxted	26/6/22	5/7/22	12/8/22	25/8/22	5/9/22
Durrington ...	10/6/22	23/6/22	15/7/22	12/8/22	30/8/22
Eastergate	15/6/22	15/7/22	1/8/22	18/8/22	4/9/22
Hassocks	17/6/22	14/7/22	26/7/22	4/8/22	28/8/22
Hawkhurst ...	23/6/22	4/7/22	24/7/22	15/8/22	4/9/22
Holmwood	31/5/22	30/6/22	14/7/22	5/8/22	23/8/22

Each sub-centre is provided with a complete set of ordnance maps, and works in cordial co-operation with the local engineers.

In allocating territory to contract officers, consideration should be given to the potential possibilities of the respective sections, road and rail travelling facilities; not on the basis of an average number of telephone stations to each contract officer. Conditions vary and out-stationed contract officers in undeveloped areas with a comparatively small number of existing subscribers have equal opportunities with contract officers stationed in the populous centres where the service is more fully developed.

Coming to the contract officer. To be successful in the arduous quest of new business a contract officer should possess invincible optimism, planning his work with insight and method. His appearance, conversation and bearing should be such as to convey a favourable impression upon the potential subscriber. Slovenly deportment militates against business success. He must be "rate perfect" and trained with a general knowledge of the telephone service which will enable him to discuss it intelligently with existing and prospective subscribers. He must be an enthusiast with an objective: "the development of the telephone service." Without an objective, enthusiasm wanes. Resourceful and adaptable in argument, patient and tenacious, he knows that "the proper study of mankind is man." The "personal equation" is the great factor in contract work and may be briefly defined as the ability of the contract officer to adapt himself to the personality of the prospective subscriber that his proposition may be acceptable. A contract officer who does not combine the general qualities enumerated is hardly likely to achieve marked success and has mistaken his vocation. The paper work of contract officers should be reduced to a minimum and they should be relieved of simple removal and superseding work, which should be dealt with by the Contract office, leaving the contract officers free to concentrate on obtaining new business and retaining existing business. With organised contract work and the recording of calls on the cards provided, an efficient contract officer will in time be able to account for the majority of the potential subscribers in his district and keep in touch with changes of tenants and new arrivals. His records can be kept in such a way as to enable an alteration of territory to be made without adversely affecting the new business prospects.

The opening of new exchanges forms a highly important duty. A good basis for these canvasses is to consider the possibility of converting each rural call office into an exchange which, in addition to meeting the requirements of residents and traders situated within 2 or 3 miles therefrom, enables rural party line services to be extended to the more remote and scattered territory. There is no doubt that the effect of past economic conditions as regards the provision of new exchanges has resulted in rural party line services being provided in localities which could be more adequately served by a local exchange and has prevented the development of these services in the more remote villages they were primarily designed to serve. The new conditions enable the new business net to be cast still further.

Writing with a long and successful experience in opening new exchanges, I have always found it good policy to secure the influential support at the outset of the canvass and have invariably made the first call on the local vicar; not that he is usually a likely subscriber as he probably finds the cost of living percentage bears no closer relation to his expenses than it does to those of the Civil servant; but he will be interested in the progress of his parish and often furnish much useful information about his parishioners. In turn, the influential subscribers will often volunteer assistance in securing the support, either by introduction to their friends or by personal activity, which materially aids the success of the canvass.

Development studies have been dealt with by able and qualified writers in the TELEGRAPH AND TELEPHONE JOURNAL but it is perhaps permissible to express the view that the only study of real value is the block development study. Consideration of past growth is of small utility, owing to restricted conditions during the expiring years of the National Telephone Company's licence, the incidence of the war and later economic conditions. When one considers the development of the telephone service within the past 20 years, in spite of prejudice and various retarding factors, one can only realise the vast possibilities of the future, with the number of telephones likely to be doubled within a comparatively short period and quadrupled at no far distant date. Effective contract work combined with prompt completion of orders and efficient service will enable the vision to be realised.

The development of Call Offices has not received the attention it deserves, and one may visit many towns where the number of signs advertising Call Office facilities is lamentably small. The educational value of Call Office

Digitized by Google

service is too well known to need further emphasis but the old slogan "a Call Office in every block" in the populous thoroughfares needs reviving.

The compiling by the exchanges of lists of people called for who are not connected is of considerable canvassing value. These lists are dealt with in the ordinary way of business and not by a selective canvass, the method being quite as effective and less costly.

It should be realised that the Contract Department is not merely an enquiry bureau but a "live" business department. I have heard it remarked that, in a Government Department with a telephone monopoly, people needing the service should come along and ask for it. This contention, which shows lack of vision, is fortunately rare. Telephone development is good for the State, in the sense that commercial lines of communication will ultimately reach the remotest villages; good for the subscribers, who receive an enhanced value for their subscriptions by reason of the accession of large numbers of new subscribers; good for the Department, who benefit by the cumulative revenue; and for the further reason that active telephone progress will absorb a large and increasing amount of labour.

The Contract Department will take its great part in telephone progress, facing the future with unconquerable optimism, having as it motto "FORWARD!"

A UNIVERSAL FIVE-UNIT CODE FOR PRINTING TELEGRAPHS.

BY A. E. THOMPSON,
(International Western Electric Company).

As it is now generally recognised that the 5-unit code is best suited for Printing Telegraphs, the time is perhaps opportune to agree upon a universal method of using the code. This would facilitate the operating of International circuits by Printer Systems, and would make for more efficient handling of messages in all European languages.

The purpose of this memoradum is to point out the merits of the Western Electric, or Murray code over the original Baudot code. Fundamentally, of course, these are the same, the difference being in the association of the signal combinations with the letters of the alphabet, figures and other symbols.

The modified Baudot code was first proposed and used by Mr. Donald Murray in his high-speed automatic printing telegraph system. One purpose of the modifications made by Mr. Murray was to reduce the amount of wear on the various machine units, primarily on the perforator, so as to minimise the cost of maintenance. This is achieved by using only one impulse for such letters as E. and T., which recur most frequently in the English language, two impulses for such letters as A I R N O, &c., which recur next most frequently, and so on.

Although the changes were based upon the letter frequencies in the English language, it will be seen from the appendix that they are advantageous also in the following languages:—French, Italian, Spanish and Swedish. No study has been made of German, Norwegian or Danish. Opposite each letter is shown the number of punches which would be actuated per letter (1) with the Baudot code (2) with the modified Baudot.

It will be seen that when the frequency with which the letters recur is taken into consideration the original Baudot code involves more perforations than the modified Baudot code as shown below:—

	Modified Baudot.	Baudot.
English	100	124.2
French	100	116
Spanish	100	130
Italian	100	124.8
Swedish	100	119.3

The advantage to be derived from these changes, such as the less frequent sharpening of perforator punches, are not of great importance, but if a serious effort is to be made to produce an ideal telegraph system it can only be evolved by taking into consideration all such minor features.

Correction of Errors in a Page-Printing System.

If it is to be used for a page-printing system the Baudot code requires to be modified so as to provide means for the elimination of detected errors at the sending end. This can be accomplished by using the signal combination **1 2 3 4 5** (letter P in the Baudot Code) as the "letter shift" combination, and providing means on the keyboard perforator for back-spacing the perforator tape, letter by letter.

For example, if the word PARIS is punched PAIRS, the tape is back-spaced three times, Fig. 1.

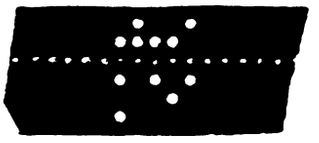


FIG. 1.

and the "letter shift" key depressed three times, followed by RIS. On the tape the word appears as in Fig. 2.

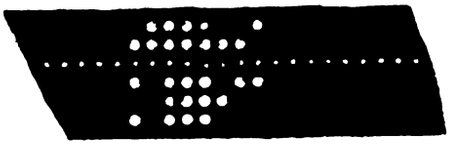

FIG. 2.

With a printer which does not space forward when the "letter shift" signal combination is received, the word will be printed PARIS. That is, the error has been corrected without mutilation.

If an error be made in a group of figures the series of "letter shift" signals must be followed by the "figure shift" signal to restore the printer to the "figure shift" position." Consequently, it is essential that neither the "letter shift" or "figure shift" signals shall produce a spacing movement on the printer.

Automatic Control.

Another device used in the Western Electric multiplex system the practicability of which necessitates the non-spacing of the printer with certain signal combinations, is that known as the Automatic Control. By its means it is possible to interrupt automatically the transmission of a message, send signals wihch will cause a bell at the printer at the distant station to be rung from one to five times, without producing any mutilation of the message in course of transmission. This is achieved by inter-connecting a switching mechanism termed the auto-control between the transmitter and the sending segments of the distributor. The auto control comprises a group of permutated cams which cause the following signals to be transmitted:—

"Fig. Shift,"
"J"
"Letter Shift,"

meanwhile stopping the transmission of the message.

In the upper case position for letter J the circuit of a bell on the printer is closed and the bell rings once. Therefore, if these signal combinations are repeated one or more times, the bell will ring a corresponding number of times.

By arranging a code of signals for these bell rings, it is possible for a printer operator to transmit to the distant station such requests as "Stop," "Start," "Re-run," "Re-punch," without calling upon the perforating operator.

If the automatic control is to be used at all times, it is necessary that the "figure shift," "bell signal," and "letter shift" signals shall cause no spacing movement on the printer, otherwise the message would be mutilated.

Group Combinations.

When the "figure shift" and "letter shift" combinations do not produce a spacing movement on the printer, it is possible to reproduce such combinations as 1st, 2nd, 3rd, 2 LG 5 exactly as set down on the original message form. Such combinations appear as 1st, 2nd, 3rd, 2 LG 5, on the Baudot printer.

Handling Messages in Foreign Languages.

In order to be able to transmit messages in such languages as Swedish, Danish, Norwegian, French and Spanish, the following extra letters are necessary, ö, œ, é, æ, ä. By having these letters as "upper case" characters, and using a printer which does not space forward when the "figure shift"

Digitized by Google

and "letter shift" signals are received, it is possible to print words composed of letters in both the lower and upper case. Here again is shown the advantage of the non-spacing arrangement as used in the Western Electric systems.

Position of Letters and Figures on Keyboard.

The position of the letters on the Western Electric keyboard, and in fact on all 5-unit code keyboard machines, except the Carpentier, is in accordance with standard typewriter practice in America and England, except that only three rows of keys are provided instead of four. As it is not essential in a printing telegraph system to make provision for two series of letters (small and capital), as is done in the case of typewriters, the "upper case" characters differ from those in typewriter practice.

Position of Figures in Upper Case.

The numerals appear in proper sequence as "upper case" characters on the top row of keys instead of having a separate key row for themselves. This is a distinct advantage from an operating point of view.

Experience has shown that faster and more accurate work can be done with fewer keys, using shift keys, and practically all typewriters now have but four rows of keys, whereas at one time 6 and 8 rows of keys were commonly used. Some manufacturers have gone further in this direction, in providing two shift keys, using only three rows of keys as in the printing telegraph keyboard perforator machines. Further, a machine with but three rows of keys is cheaper than one with four, and is less costly to maintain.

Perforator for Baudot Code.

If a keyboard perforator be used for preparing messages in the Baudot code, the figures will be scattered throughout all three rows of keys. From an operating standpoint this is a disadvantage, but it may possibly be considered that the resulting loss of speed would be partly compensated by a higher standard of efficiency in the transmission of figures. The scattered lay-out can be avoided by using some complicated change-over device in the perforator, but this would involve increased maintenance, and probably impair the "touch" of the keys.

Conclusions.

To adapt the Baudot code to page-printing and automatic transmission, the following modifications would be required:—

1. Provide a space signal.
2. Change combination for letter P.
3. Letter shift signal should be the old P signal combination (12345).

APPENDIX.

NOTE.—For the purpose of this study and the production of the tabulated results, the leading article of a newspaper printed in the respective countries was used.

Column 2 shows the total number of letters appearing in the article.

The totals under columns 5 and 6 indicate the actual number of punch operations that would be involved in preparing the newspaper article for telegraph transmission:—

1. By a standard Western Electric perforator.
2. By a perforator adapted to the Baudot code.

To use Western Electric or Murray keyboard perforators on existing Baudot circuits it would be required either to—

1. Change the printing wheels on traducteurs to accord with the modified code; or
2. Change the permutations on the key levers to accord with Baudot code. With this arrangement numerals will appear scattered throughout the keyboard; or
3. Embody a mechanical code change-over device in the perforator to avoid the disadvantage indicated under 2.

If it is the intention to change over to page-printing at some future date, it would seem worth while at this time to adopt the code and letter positioning as used on the Western Electric system. Provision of new type-wheels is less expensive than altering the keyboard permutations, and by having two sets of type-wheels, a Baudot set can be made available for reception either from a standard 5-key keyboard, or from a typewriter keyboard perforator and automatic transmitter, in a few minutes.

The time is opportune for deciding upon a five-unit code by means of which messages in such languages as English, French, Swedish, Norwegian, Danish, German, Italian and Spanish can be accurately handled.

The modified Baudot code with minor changes in the upper case characters, used in conjunction with a printer which does not space with the "letter" and "figure shift" signal combinations will meet all requirements in this direction.

The rapid development of wireless telegraphy is due partly to the adoption of a universal code, and if the Baudot principles of telegraphy are to become universal, it will be necessary that steps be taken to secure like uniformity of code in all countries.

CENTRAL TELEGRAPH OFFICE BAZAAR.

THE preparations for the Central Telegraph Office Bazaar in aid of St. Bartholomew's and other hospitals, are reaching the final stage. It may seem to be a little unfortunate that the General Election Polling Day coincides with the first day of the Bazaar, but those responsible for the Bazaar are hoping that the effect will not be serious and are re-doubling their efforts to ensure success. Her Majesty the Queen has graciously sent a number of beautiful presents including a wonderful doll's house and a number of pictures and porcelain of various kinds. A large number of contributions in kind have been received and attention is now directed to the proper advertisement of the Bazaar in order that a sufficiency of purchasers may come. The various Divisions have contributed a rich variety of gifts and some of them have specialised in particular directions, for example, one Division has provided sweets and another Division has provided dolls and another Division a large amount of knitted costumes. There will be a large number of concerts in the way of side shows.

Provincial friends will be glad to know that an album of photographs of the different Galleries is still on sale, and Mr. C. P. Burch of the "F" Division will be glad to receive applications.

EDINBURGH RADIO AND TELEGRAPH AND TELEPHONE SOCIETIES JOINT MEETING.

A LARGE audience under the auspices of the above Society assembled to hear Major Jayne, Controller of Telegraphs, lecture on "Modern Telegraphy" at the Society of Arts Hall, on Oct. 4, with Sir Alfred Ewing, K.C.B., Principal of Edinburgh University, presiding.

The lecturer, by means of lantern slides, explained quite briefly the progress of telegraphy up to the present time. He dealt at some length with machine telegraphy, particularly the multiplex and the 5-unit code system. At the present time he said multiplex telegraphy held the field, and there were almost as many advocates of different systems as there were systems. Enthusiasm varied in relation to the extent the advocate was a specialist in one or other of them. He begged the audience not to shut their eyes to the developments and possibilities of other types of apparatus than the ones they had made their specialities; and to keep their minds open to the rapid advance that was being made, not only in the wireless world, but in the telephone world, and endeavour to be impartial in all matters of scientific progress. He thought the time was near when start-stop type-printing apparatus would be generally adopted for all lightly loaded circuits.

Major Jayne laid emphasis on the need for as much research on the operating side as on the purely scientific side and attached great importance to close collaboration between these sides before any fresh apparatus was installed for working trials, either in a telegraph room, a telephone room, or a wireless station.

Excellent slides were shown to illustrate points in the lecture, and those portraying the interior of the Central Telegraph Office, London, Edinburgh Telegraph Office, and various wireless stations, created a good deal of interest, particularly those tracing out the distant control system from beginning to end of the London-Stonehaven Wireless Traffic Channel. In addition to scientific or technical progress, it was, he said, of vital importance from all points of view that the question of office organisation should receive adequate attention.

Some very interesting information to the public was given in the section devoted to the Imperial Cable.

FLEETWOOD AUTOMATIC EXCHANGE.

FLEETWOOD Exchange has been equipped with the Relay Automatic System and is unique in that it is the first of its kind opened for public as distinct from private service. All modern telephone systems, whether manual or automatic, utilise small electro-magnetic "relays" to a very large extent for controlling the various electrical circuits, but the system installed at Fleetwood is remarkable for the fact that it performs the whole of the work of establishing and controlling subscribers' connexions entirely by means of such "relays," without the intervention of mechanical switches or continuously rotating shafting employed in other automatic exchanges. The system has been aptly termed the Relay System; it might also be characterised as the silent and motionless system, for the moving parts are so light and their travel so minute that it is difficult to detect any movement when the apparatus is in operation. The exchange has an ultimate capacity for 920 subscribers.

The requirements of any telephone service are exacting and complex, and particularly is this true of a public exchange such as Fleetwood. The new automatic installation, however, experiences no difficulty in meeting the many and varied demands of the service with far greater precision and speed than could be attained by human agency.

"TALK OF MANY THINGS."

THE closing date for entries for the "Amusing Incident" competition is Nov. 30, so that those whose comic muse has not up to the present time manifested itself, will have time to think again.

The competition has been criticised by some as not affording enough scope, the allegation being that there is nothing superlatively amusing in the atmosphere of an exchange. Well, of course, it all depends on the point of view. Let us take, say, your first day in the exchange. Looking back at it, and at what you were then, is there not something that makes you smile—some misapprehension you were under in your unfledged state, some amusing error you made? We remember on our own first day at school, at the early age of five, being asked by the headmistress, "Can you draw?" and our eager "Yes." Her amused: "*What* can you draw?" and our reply, in lamentable English, "Old mans;" which called forth the stern rejoinder: "Oh, but you mustn't draw 'old mans' here!"

And official first days—and even many succeeding days—must contain many a *faux pas* of a humorous nature—even if not apparent to the victim at the time. We hope to receive many more entries before the closing date.

We are glad to say that we have had several contributions from our Provincial colleagues, and we hope to publish some of them next month. We shall be glad to receive others from the Provinces, and also from London, especially prose (not prosy) articles, rhymed entries being rather a glut upon the market at present.

At the first meeting this session of the London Telephone Society (commented on more fully in another column), Miss James, of Gerrard, referring to the title of the paper "Where are we going?" said that so far as the women are concerned, as the men are in power, she supposed they would go just as far as the men would allow them! This remark seems to fit naturally under the heading, "Things that might have been expressed differently." The fervid proposal of Mr. Dive (always our champion): "I move that women be allowed to go the whole hog," had no seconder, so that's that!

Seasonable Thought.

"Rainy days will surely come,
Take your friend's umbrella home."

Swimming.

S is for Swimming, so dear to our heart,
W Women—with fervour take part,
I the Instruction, all learners should heed
M Many hours spent on getting up speed,
M for the Men who are like us in zest,
I the Intention of doing our best
N Never flinch in the face of bad luck,
G Gala Night to exhibit our pluck.

L. A. FISHER.

Courtesy in the Provinces.

OPERATOR: "Your time is up. Will you have another call?"
OBLIGING SUBSCRIBER: "No, thank you; the same one will do."

(*Llandudno*).

Miss E. A. WILLIAMS, Regent Exchange.

Ladies' 120 yards Championship of the Post Office.

We print some impassioned outburst from Miss Gertrude M. Turner. Her percentage of "unoccupied time" will indeed be low if she carried out one tithe (or perhaps we should say 0.1) of the somewhat ambitious scheme outlined in verse 3.

A Soliloquy.

After reading some advice from Miss Dorothy Turner.

Three months ago I scanned these pages,
And read advice from many sages.
Then in our column I did note,
"We really do not want a vote,"
My name is "Gertrude" I'm called "Gerty,"
I want a vote, though I'm *not* thirty.

Shy as a child: when I was older
I made a dash—and then grew bolder.
Knowledge and wisdom oft I sought,
With thinking people, then I thought,
In wisdom's ways I'm yet a learner,
And still I'm only plain "Miss Turner."

'Tis not for fame my heart is yearning,
My soul to higher things is turning.
I'll take my place in life's affairs,
Bearing all other people's cares.
Women of any rank or station,
Can help to guide and rule a nation.

They say we're as a nation slacking,
In great ideals we now are lacking.
I ask you, "Is this really true?"
The future lies with me, with you,
That in the end we may have striven,
To honour God by gifts He's given.

Why cannot we all take our places?
Staunch in this life's stern hard-won races.
Strong women with the head and heart,
In every age have borne a part.
Sisters! the "Age of Peace" is dawning,
Be *ours* the glory of the morning.

G. M. TURNER.

LONDON ENGINEERING DISTRICT NOTES.

Nights Out.

THE Telephone Society is to be congratulated on securing such a fine set of papers this year. The authors of the papers are all men who are worth listening to at any time, and the range of subjects is so wide as to negative any suggestion of monotony.

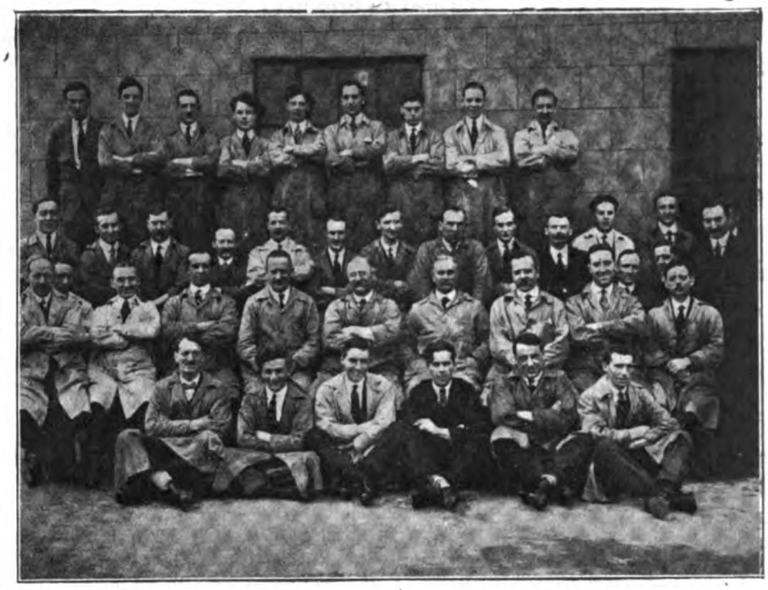
The Institute of Post Office Electrical Engineers opened its Winter Session on Oct. 10 with a paper by Mr. J. S. Elston, on "Applied Telephone Transmission." The programme of this Institution is not completed, but papers have been promised on "Wireless Telegraphy" by Mr. Shaughnessy for November, and on "Electrolysis" by Mr. Bartholomew for December. Other meetings will be announced later.

The several series of lectures to be given by the Institution of Electrical Engineers, the Wireless Society, the Society of Civil Servants, the Institute of Public Administration, and the Institution of Professional Civil Servants, must of course be attended by those who wish to keep abreast of the times. The one or two nights off will no doubt be spent in the bosom of one's family if one or other of the societies mentioned has not ear-marked them for public dinners.

Transmission.

The proper study of mankind is man, and the proper study of Telephone Administration is Transmission. Towards the latter end of the late National Telephone Company's licence a great deal of attention was given to this subject, and certain standards were agreed upon jointly by the Post Office and the National Telephone Company. The Company issued some very explicit technical instructions on the subject.

Since 1911 the study of transmission has been pursued in conjunction with the study of traffic routing. From time to time instructions dealing with various phases of the subject have been issued from headquarters. On Oct. 10 Mr. Elston summarised the present position of this important branch of the Department's work in an admirable manner, in a paper read at a meeting of the Institution of Post Office Electrical Engineers. Listening to the paper one might have been led to believe that the matter is a very simple one, but the subsequent discussion brought out a number of points that indicated that there is more in it than meets the eye. The present position, briefly, is that the United Kingdom has been divided into some 13 zones, and in each zone are one or more group centres with dependent exchanges linked to them. All trunk traffic passes *via* one or more zone centre, and an extreme connexion may involve switching at two zone centres, two group centres and two dependent exchanges, with the use of five links. Transmission allowances have been fixed for each class of link, for the losses at the intermediate exchanges and for the subscribers' loops. The total allowance in the worst possible case is limited to 35 miles standard cable, zero loop basis, which is taken to be the limit of commercial speech. The apportioning of the permissible allowances has of course been considered from an economic standpoint, as an alteration in the allowance of one section of the system naturally affects the allowances in all the other sections. A little thought will make it apparent that the economic proportioning of costs must have involved some extensive and careful calculations.



The allowances having been fixed it is the engineer's duty to design his plant so as not to exceed them, and of course to keep his costs to a minimum. Unfortunately, line plant cannot be moved or altered in constitution to suit changing incidences of traffic without heavy expenditure.

Expectations in regard to inter-zone circuits are that by the use of telephone repeaters the standard mile equivalent will be reduced at the same time as the weight of the copper required, although some hints were given in the discussion that there are some flies to be extracted from the amber before its full value can be realised.

Technical Classes.

In the August 1921 issue a paragraph appeared under the above heading setting forth some of the particulars of the classes held under the aegis of the P.O. Engineering Department at various Technical Institutes in and around London.

The 1922/23 Session has now commenced and the many members of the staff are taking advantage of the facilities afforded, but the entries are not so numerous as last year. This is partly accounted for by the fact that very few additions are being made to the staff. If the staff were to remain at a fixed number for a few years the tendency would naturally be for all those capable of obtaining certificates to do so and for the number of students to diminish year by year.

THE MECHANICAL STAFF RESPONSIBLE FOR THE MAINTENANCE OF THE MACHINE TELEGRAPHS AT THE C.T.O.

The staff of the district at the present moment hold some 1,000 certificates for P.O. Classes, while there are over 400 in receipt of technical allowances in virtue of holding City and Guilds Certificates.

There is bound to be always a fair number of men who on account of age, domestic reasons, and so forth, do not take up the classes. Very great care is exercised by both the Institute Authorities and the Department to make the clases of real value, and anyone who is eligible and fails to avail himself of the opportunities afforded is acting in a very short-sighted manner. It is not wise for those who aspire to gain promotion in the career they have chosen to give all their attention to technical studies, and in this connexion it may not be out of place to give the following extract from an address given by Mr. Highfield before the Institution of Electrical Engineers on taking up his office as President of that body in 1921:—

"I use the term education to include all upbringing, the formation of character, the means of health of both body and mind, the Christian virtues, the love of work, the need of service and the sacrifice for duty that alone should win us rights. Every skilled trade is in its nature an art, just as music, painting and sculpture are arts, and all arts must be practised at an early age. Education besides assisting in the perfecting of art must be directed mainly in the formation of character, and continuity of education should be insisted on so that no student leaves school or college with any other idea except that he leaves with a mental equipment designed for the acquisition of further knowledge."

Wireless.

By the time these notes are in print the broadcasting system should be in operation in London. The promoters have a great opportunity for creating liveliness in the electrical supplies industry and it is hoped that they will rise to the occasion. The difficulty will be to cater for all classes and tastes. Generally, when one sets out to amuse or interest oneself there is a large field of choice: one is not bound to see the same play or read the same book as everyone else, but "listeners-in" will have to take what is given or nothing at all. Unless the taste of all classes is satisfied there will soon be a large number of second-hand sets to be picked up at low cost. Demands for licenses from members of the staff continue to pour in. At the outset the neophyte is content with the simple crystal set, but soon the desire to extend the area of search sets in and more and more money is spent in elaborating the receiving apparatus. Back gardens are rapidly being disfigured by aerials. It is to be hoped that in the interests of suburban amenities that indoor aerials will soon be generally adopted. It would be helpful to many members of the staff if the editor would prevail upon Mr. Addey or some other expert to write an article for the JOURNAL giving detailed instructions for the construction of simple home-made listening-in sets.

New Tube to Liverpool Street Station.

A new 2¼-inch pneumatic tube has just been completed between the C.T.O. and the railway company's telegraph office in the Great Eastern terminus. The usual lead street tube is continued inside the station by means of a brass tube suspended from the foot-bridges across the station. In front of the main booking hall, however, the company.s own brass tube under the metals was utilised. This section of tube had been down about 40 years and had been derelict for many years past. It was in an excellent state of preservation, but it was found necessary to remove two faults which had developed during the idle period. This was done by the Post Office staff, who indeed carried out the whole of the construction work.

Internal Construction.

The transfer of a further batch of 226 Hampstead subscribers to the new Maida Vale Exchange was effected on Sept. 23, thereby affording additional relief to the Hampstead Exchange. It is satisfactory to note that this transfer was carried out without a single fault arising.

On Oct. 2, 1,260 lines were added to the Clerkenwell Exchange. These lines were transferred from Central, City, London Wall, Bank, Holborn and North.

Alterations and additions have been completed at Gerrard, East, Ilford, Hop and Palmers Green.

An extension of the Park equipment is in progress. This involves the provision of 12 A and 13 B additional positions and will increase the local line equipment by 1,460.

The work of constructing the new Operators' School in the Clerkenwell Exchange building is nearing completion; 24 A and 9 B positions have been installed. The school will replace those at London Wall and G.P.O. South.

An addition to the Bartholomew House Exchange is in hand, and on completion it will be possible to meet the requirements of a number of prospective subscribers who, it is understood, are desirous of obtaining service—a fact which is some indication of an improving condition in the world of finance.

Presentation of Imperial Service Medals.

An interesting occasion was that on Oct. 2, when the Superintending Engineer, Mr. McIlroy, presented on behalf of His Majesty the King the Imperial Service Medal to Messrs. F. J. Skinner, inspector, and G. Jones, skilled workman, for long and unblemished service with the State. Reference was made to the long and intimate connexion that Mr. Skinner had had with the C.T.O., and to the many epoch making changes that had taken place during his 45 years of service in that office. Representatives from the Controller's staff were present to wish their old colleague a long and happy life in his retirement. Mr. Jones who had been on the C.T.O. clock staff saw service originally with H.M. Office of Works, and when the clocks in Post Office buildings were transferred to the care of the P.O. Engineering Department in 1913, Mr. Jones came with them.

Relay Automatic System.

Through the courtesy of the Relay Automatic Company many members of the Institution of Post Office Electrical Engineers visited Marconi House during the second week in October, and had the system explained to them from a theoretical standpoint with the aid of some very clear lantern slides by the company's Chief Engineer, Mr. Bryant. Afterwards a demonstration with working apparatus was given by Messrs. Johnson and Hollings. So much trouble was taken to make the subject clear and the demonstrators were so entirely masters of their subject that no single visitor could have left without having gained a good grasp of the subject.

The writer of this note has always had a strong belief in the future of this system, partly because of its obvious merits and partly because of the fact that the Company's Engineers and senior officers are nearly all old National Telephone Company's men, who during many years' practical experience have gained that telephone sense which can only be acquired by those who love their work sufficiently to make it their hobby.

The relay is so familiar a piece of telephone apparatus and plays such a large part in every telephone exchange system, whether manual or automatic, that its possibilities and performance are well understood. Despite the fact that all the requirements of a large public telephone exchange have been met with the relay system no mechanical aids have had to be adopted. The type of relay used is so reliable that maintenance troubles are negligible even when no special precautions are taken to exclude dust from the plant. By careful circuit design the number of relays per line has been kept at quite a low figure even in the largest installations. The firm has plants in all parts of the globe, which are giving entire satisfaction.

There is little doubt that there is a bright future in store for the system in the public exchange field. The Department's Fleetwood Exchange was supplied and equipped by the Relay Automatic Company, and is, it is understood, giving complete satisfaction.

Everyone who had the privilege of being one of the party of visitors regretted the enforced absence, due to indisposition, of the Managing Director, Mr. C. B. Clay (late Metropolitan Superintendent, N.T.Co.). Mr. Morley Ward, the Manager, acted as host in Mr. Clay's absence. Thanks are due to all the officers of the Company who took such pains to make the visit instructive and agreeable.

LONDON TELEPHONE SERVICE NOTES.

The Telephonists' Society.

THE first meeting of the Session was held on Friday, Oct. 13, to hear Mr. G. Buckeridge read his Presidential address. There was a good attendance, and the new meeting place, the Y.M.C.A. Hall, Aldersgate Street, proved to be an improvement on former places.

The title of the address, "Where are we going?" had created a good deal of curiosity, but Mr. Buckeridge left us to find our own answer. He pointed out that never before had the telephone world such a wealth of knowledge founded on experience, and that the wielders of the economy axe should pause and reflect awhile before attacking such a healthy tree. The immediate past was reviewed and the effects of various circumstances and conditions upon telephone progress commented upon. Amongst these were the after effects of the War, the trade boom and the subsequent slump and the later tendency for trade to revive. It was remarked how the slumbering giant of progress was stirring himself and schemes for further development were taking shape. The progress made in automatics in the Provinces was mentioned, and also the great possibilities of wireless telephony.

Mr. Buckeridge said that superficially, and so far as the outsider could see, we had stood still for the last eight years, but in fact much had been done in preparation for the future.

Some interesting figures were given illustrating the importance of London in the country's telephone service. London has 31 per cent. of the total number of subscribers' lines in the Kingdom; 50 per cent. of the Department's telephonists are busy in London and of the 33,600 or so P.B.X. switchboards, 12,900 are in the Metropolis.

The opening of the Toll Exchange and the recent extension of its scope was mentioned as one of the outstanding features of recent times, and the handling of calls to more distant places than Brighton was confidently looked forward to.

Attention was drawn to items which constitute a drag on the operating staff and possible remedies were suggested. The collection of fees through coin boxes, the offer to complete ineffective calls and the resulting increase in ticket work, some drawbacks in the enquiry system, and the high percentage of junction traffic with the inevitable troubles were among the matters mentioned. A strong point was made of the big influence on the service of the great number of B.P.X. telephonists employed by subscribers, and the need for the closer co-ordination with the Department's methods was emphasised.

Mr. Buckeridge's provocative title "Where are we going?" gave rise to a lively discussion.

Mr. Corner mentioned that now "familiar friend," whom most of us have met on many occasions recently—in print—who it appears is again in Petrograd making calls from public call offices, and who is still being told, "Please put 30,000 roubles in, and turn the handle after each."

Mr. Stirling told us that he knew where *he* was going, as he had been told by preachers many times his destination if he did not reform; but he was still far from clear where *we* were going, as Mr. Buckeridge had omitted to answer his own question.

Mr. Dive told us one of his happy and apt stories, proving that although we may *think* we know, some influence beyond our control might lead us quite otherwise. Mr. Stirling must have been greatly cheered by this thought. Mr. Dive added parodying Kingley's note on "Tobacco." "The telephone is for the tired man rest, for the hungry man food, for the sad man cordial, for the lonely man company; there is nothing like it under the canopy of heaven!"

Miss James then rose and said that she thought it was time that a woman spoke. It was! Her fervent little speech brought a generous assent from Mr. Dive.

Miss Heap, whom we are all very glad to welcome as an honorary member of the Society, told us how, at the age of sixteen, somewhere in the "eighties," she sat upon a coalbox, and, to the unfeigned admiration of the Superintending Engineer, read Shakespeare between the calls! (We hope there were no pressmen present on Friday.)

Miss Cox said that, according to experts, there would be no need of telephones in the future, because each person will know what every other person is thinking.

This chastening thought brought the Chairman, Mr. Pink, to his feet. He refused to dwell on that aspect of the future, but let us instead glance at some of his visions, a very brief glimpse, perhaps, but one which stirred the imagination of us all.

Mr. Buckeridge then replied to the questions which had been raised; and the first meeting of the Session came to a highly successful finish. We congratulate Mr. Buckeridge on his maiden Presidential speech.

Owing to an unfortunate clashing of dates with other fixtures, the next meeting of the Society has been postponed to Wednesday, Nov. 8, when Mr. H. L. Pountney will discourse upon "The Opening of New Exchanges."

London Telephone Service Swimming Association.

The London Telephone Service Swimming Association held its second Gala of the season at Pitfield Street Baths on Friday, Oct. 6. Excellent as the first Gala was, the second was even better, and the well-appointed Baths was packed. The evening commenced on a top note, the first item being the heats for the much-coveted "Pounds" Challenge Cup, competed for by teams of four from the different exchanges. There were eighteen entries so that three heats had to be decided before the final. The holders of the cup were Gerrard Exchange. Gerrard, Central, Trunks, Hammersmith, Regent and Victoria contested the final, which was won by Regent after a magnificent struggle, the holders being second. A sealed handicap in connexion with the event resulted in Central being the winners, Regent and Gerrard following.

WHERE TO STAY.

The attention of our Readers is directed to the following list of Boarding and Apartment Houses.

BOURNEMOUTH.—"Glen Cora" Boarding House, Hawkwood Road, Boscombe. Superior and Comfortable "home from home." Central and few minutes from sea. Liberal table. Highly recommended. Stamp for tariff. Mr. and Mrs. Halliday.

BRIGHTON.—Rusthall Boarding Establishment, 11-12, Cannon Place Central. One minute West Pier. From 2 guineas weekly.

Digitized by Google

A little later the men had a look in, the "Prossor Cup" being the coveted trophy. The cup is competed for annually by teams from the Traffic Districts and Headquarters Sections. Five teams entered, the holders, the Service Section, being again successful. Last year's runners-up, the North-West District, maintained their position.

There were three handicap events, one confined to Supervisors, another to the West and North-West Districts, and the third the Lotos Club Handicap.

The London Telephone Service Diving Championship was won by Miss H. Davis, of Gerrard, the judges placing her half a point in front of Miss E. Williams of Regent.

Results :—

"POUNDS" CHALLENGE CUP. (Team Race 133 yards.)

Regent (Misses Amos, Broomsgrove, Williams and Phipps), 1; Gerrard (Misses Davis, Wilson, Burt and Smith), 2; Central (Misses Sowden, Izzard, Knight and Millbank), 3.

SUPERVISORS' HANDICAP (33 yards).

Miss Birchenough (Mayfair), scratch, 1; Miss L. T. Davies (Trunks), 1 second, 2; Miss McNee (Central), 2 seconds, 3.

"PROSSOR" CUP (Team Race, 133 yards).

Service Section (Messrs. Prossor, North, Beck and Pettigrew), 1; N.W. District (Messrs. Townsend, Higham, Reece and Mason), 2; Equipment Section (Messrs. McCrimmon, Hack, Gillett and Gregory), 3.

HANDICAP (N.W. and W. DISTRICTS, 33 yards.)

Miss Phipps (Regent), scratch, 1; Miss Hawkins (Park), 8 seconds, 2; Miss McBirney (Western) 4 seconds, 3.

LOTOS CLUB HANDICAP (66 yards).

Mr. Teed, 7 seconds, 1; Mr. Thompson, 11 seconds, 2; Mr. Frier, scratch, 3.

NOVELTY COSTUME RACE.

Winners—

Miss O. M. Jones (Central). Miss Cole (Regent). Miss Emery (Victoria).

L.T.S. DIVING CHAMPIONSHIP.

Miss Davis (Gerrard), 84½ points, 1; Miss E. Williams (Regent), 84 points, 2; Miss Phipps (Regent), 25 points, 3.

The London Telephone Service Challenge Shield awarded for the highest aggregate of points gained in selected events was won by Regent with 35 points, Gerrard being the runners-up with 21 points.

The Association is indebted to Miss Dorris Sutton (Plaistow Swimming Club) for giving an exhibition of swimming strokes, to Messrs. A. G. Griffiths and G. A. Wilkinson of the Otter Swimming Club for their splendid display of ornamental swimming, and also to Messrs. D. H. Fairman, W. G. Reid and A. S. Coombs for a thrilling exhibition of high diving.

The evening, which went with the usual swing where the London Telephone Service Swimming Association is concerned, ended with a polo match, Essex County beating the Civil Service by 7 goals to 3.

Langham Choral Society.

The first concert of the season is arranged for Wednesday, Nov. 22, at Queen's Hall. The chief item in the programme is Coleridge Taylor's "Tale of Old Japan," excerpts from Berlioz's "Faust" will also be given. The principal soloists are Miss Olive Sturgess, Wilfred Temple, and Peter Dawson. The last named is seldom heard in London, and the Society is fortunate indeed to have secured his services. Last season ended in such good style that it is confidently expected that the new season will have a good send off.

Readers of these notes who have enjoyed the Society's concerts in the past will doubtless make a point of attending on this occasion. Tickets, posters and handbills can be obtained from the Hon. Secretary, Mr. W. R. Child, of the Contract Branch, 102, Dean Street, W.1.

Gerrard.

Culled from the Exchanges.

Although the "Pounds" Cup has found a new home for the time being, a measure of consolation is vouchsafed to us through the successful efforts of Miss H. M. Davis, in the London Business Houses Diving Championship.

Regent.

Owing to the many Swimming Galas which have been taking place throughout the Telephone Service recently, the London Notes are sure to be of an aquatic nature. We may as well join the general dampness, so are including a few hitherto unpublished details concerning the Gala which took place on Oct. 6 at the Pitfield Street Baths. The cold tabulation of results in no wise serves to satisfy the detail-loving feminine soul, and leaves to the imagination the hopes and fears, the efforts and heart throbs always attendant upon such an important occasion. There are weeks of preparation and determination in which all competitors vow themselves to do their uttermost, and when, and when at long last the great day arrives, everybody anxiously scans everybody else, to ascertain if they are feeling really fit and ready. At lunch time there was a great demand for boiled fish and milk pudding, whilst the more toothsome and indigestible dishes were bravely forsworn.

In Regent there was a certain amount of anxiety because Miss Williams—whose photograph will be found in the "Telephonists' Column"—had been the victim of a 'bus accident a fortnight previous to the Gala, and it was not known until the last moment, whether she would be sufficiently recovered to take part in it. However, to their relief—and to the help of their ultimate success—she entered with a damaged hand and nerves which could not possibly be quite up to the mark.

At the baths the atmosphere was one of tense excitement. All the competing exchanges were well represented and everyone had come prepared to cheer their own particular champion to the last echo. The programme showed a list of names which proved that each exchange had sent their best—Central, Trunks, Victoria, Western, Gerrard and Regent. The result could not be anticipated. Everybody was wondering, wondering—for indeed, it is not wise to under-rate one's opponents. Mr. Pounds presided and was certainly in his element. Of course the event of the evening was the race for the "Pounds Cup" which had been in the possession of the Gerrard Exchange for two years running. Its owners were determined to fight hard for it, and those who desired it for themselves were equally determined. During the heats the spectators watched breathlessly and gave tremendous vent as each result became known. There was much discussion and conjecture during the events which separated the heats from the final. Towards the approach of the latter, there was a general air of uneasiness and apprehension. It was a matter of vital importance to each exchange that they should become the owners of the Pounds Cup and the thoughts of possible failure made them on edge. Girls refused chocolates, saying, "No thank you, not yet." Somebody said "Polly, lend me your smelling salts." Somebody else vowed she couldn't watch the progress of the swimmers—it was too much of a strain, so she proceeded to read the *Daily Sketch* upside down. There was a great outburst when the competitors entered the water and it continued—a vast column of concentrated noise which rose to the roof and if one stopped to listen, one was aware that it was made up of girls' voices hoarsely shouting, Ethel, Phippie, Gerrard, Regent! go it, Oh! one girl clutched her escort and implored him: "Say something, oh, say something quick! Shout *Regent*!" She felt her own vocal powers were worn out—he obediently yelled "Regent" and just then Regent won! It was great for Regentites. Everybody was asking everybody else if it was really true, although they had seen it with their own eyes. One of the nicest things about the victory was the sincere congratulations of Gerrard's captain—it is a great thing to be a good loser and in no wise of less account than the actual winner. Gerrard turned the tables on Regent by wresting from them the Diving Championship which they held last year—Miss Davies' diving feats were beautiful to witness. One cannot help appreciating the difficulties of the situation when one considers the position of the Traffic Superintendent who controls the two exchanges. It was necessary for him to look glad down one side of his face, and properly consolatory down the other side. The race for the men—as far as we are concerned—was chiefly delightful because it gave us an opportunity of seeing Traffic Superintendents and other dignitaries with their hair ruffled. This touch of human nature gave us a new and added respect for them. And they *can* swim too! The Novelty race was highly amusing. The girls emerged from the water in their draggled finery with great and ludicrous dignity—we enjoyed it immensely.

The whole event served to show the high standard of enthusiasm and endeavour which prevails and the grace and prowess of the swimmers were worthy of the highest priase. It might be well to note that the girls who refused the chocolate before the *Pounds* Cup Final, made up for it afterwards.

HOW THE TELEPHONE WORKS.

BY A. CROTCH.

III.

The Telephone Exchange.—We have seen how two "stations" or "subscribers" are enabled to have speech with each other. The next problem is to set up the telephone exchange or centre to which all the subscribers' lines are brought and where are provided the means by which any member can be put in communication with any other member.

The main element of such an exchange consists of a tablet or board on which are mounted a quantity of switchsprings or jacks and annunciators or indicators. Every line is brought to one of these jacks whose springs are in series with the indicator—a simple electro-magnet provided with a shutter. The first current of a series from a calling generator liberates the shutter and attracts the operator's attention. The latter is provided with a number of pairs of "plugs and cords," that is, a cord consisting of two or three flexible conductors, on each end of which a plug is connected. One of these pairs is inserted in the jacks of the calling and wanted subscribers and the two lines are thus put in connexion with each other. The insertion of a plug to a jack breaks certain contacts, cutting off the calling indicator and substituting the other subscriber's line. The act of putting them through also brings in a third piece of apparatus, the "ring-off" indicator, in bridge between the lines (at the exchange). This indicator is of high impedance so that the speaking currents, with their high frequency, will not traverse it, but the ringing current will. The dropping of this shutter is the signal for the operator to sever the connexion.

Multipling.—With an increasing number of subscribers, larger switchboards are required and more operators. With the increased size of the board it becomes very difficult for a single operator to reach the full extent of the board. Hence the plan was evolved of "multipling" the subscribers' jacks—that is, of repeating them on a second space so that all the operators have an equal chance of reaching them. This "multiple" can, of course, be repeated as many times as is necessary and the result is that every operator, in any position, has before her the full range of the entire exchange. This plan, however, at once demands that an operator, before plugging into a wanted subscriber's jack, shall be assured that that subscriber is not already engaged, that is, that no connection has already been made on another section of the multiple, out of sight of this particular operator. This is the function of the third conductor on the plug and cord. Before inserting a plug in the jack required, the operator touches the "bush" of that jack with the tip of her plug. If a connexion already exists, a current will pass to the operator's receiver giving a "click" therein. If no sound is heard, it indicates that this line is clear; the plug can then be pushed home.

By the plan just indicated, it was necessary for a subscriber to "ring up" the exchange by means of his own generator. The latter is got rid of and the calling rendered automatic by the following plan. At the exchange a battery, in series with the calling indicator, is connected to the two lines of each loop. At the subscriber's end, however, one of these lines is left disconnected. When the receiver is lifted, the circuit of the loop is established, and a path is open to the battery current, which then actuates the indicator. By this plan, therefore, to get the operator, it is necessary simply to lift the receiver from its hook. The replacing of the receiver breaks the circuit and restores the indicator to normal.

C. B. Working.—To-day, with an exchange of any considerable size, the common or central battery plan is adopted. By this,

Digitized by Google

all batteries are removed from the subscriber's premises and the current for the whole is obtained from a single battery of great capacity situated at the exchange. This battery also serves for the signalling, which is automatic. Several advantages of the plan are obvious. The placing of an enormous number of small sets of cells in all conceivable positions in a town, and the necessary maintenance visits, are saved, and the single battery is situated where it can have constant attention.

The relation between the subscriber's apparatus and the exchange is indicated in Fig. 8. The common battery is normally connected to both lines through the calling indicator, but at the subscriber's end the circuit is broken by a condenser which is in

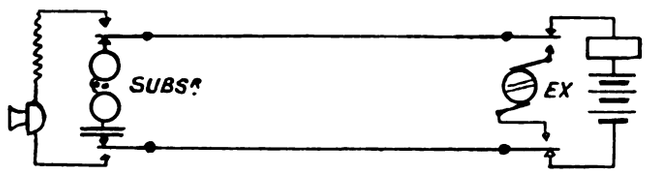

FIG. 8.

series with a magneto bell. When the exchange calls, the generator is applied to the loop and the bell is rung through the condenser. when the subscriber requires the exchange, he lifts his receiver and this brings one winding of his induction coil and his transmitter across the lines, thus opening a path for the current from the exchange which actuates the calling indicator.

Fig. 9 shows the connexions of the subscriber's set. It is actually a wall set, but a table instrument obviously consists of the same essentials, differently arranged. On the right of this figure the skeleton of the connexions is shown.

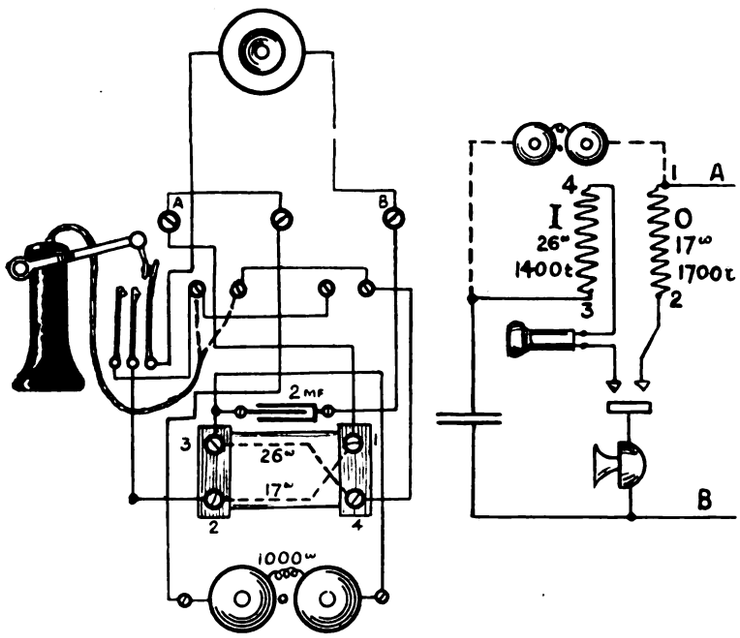

FIG. 9.

The transmitter is the " solid back " of Fig. 5. The induction coil is considerably larger than the one used for magneto working and the ratio between primary and secondary winding is considerably different. This will be understood when it is remembered that this induction coil has to serve in the reception of speech as well as in its sending out. Its first winding is of 1,400 turns, of 26 ohms., and its second of 1,700 turns of a larger wire, giving a resistance of some 17 ohms.

The subscriber's connexions at the exchange are shown in Fig. 10—that is, the essentials. In every section of the exchange the subscriber has a jack : this is shown at the top of the figure. In addition, he has an " answering " jack on one particular section only. That is, his calls are received on one position only, but he can be *called* on any section. All these jacks are in parallel with each other and all their bushes are connected together. CO is the " cut-off " relay : through its contacts one wire of the loop

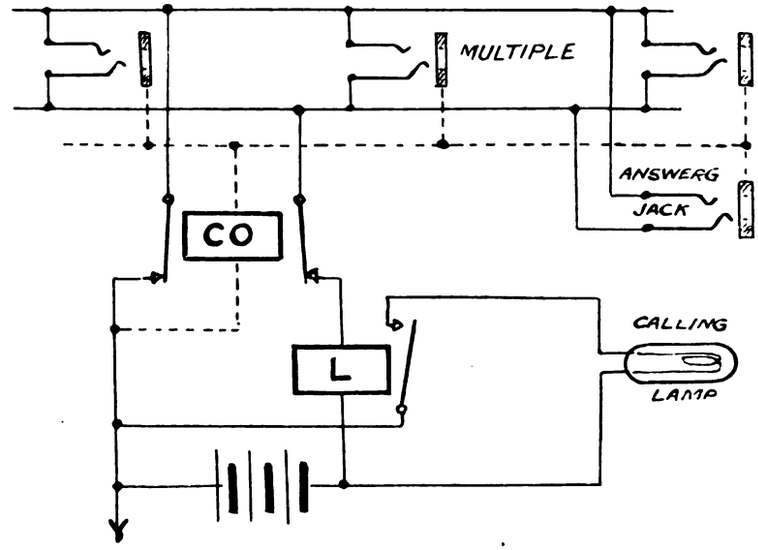

FIG. 10.

is taken through the line relay L to one pole of the common battery. and the other line to the other pole. When the subscriber lifts his receiver he opens a path between his two lines, the current flows and actuates the line relay. Its armature closes the circuit of the calling lamp and gives the signal to the operator that he requires attention.

The line and cut-off relays are generally mounted in pairs and are indicated in Fig. 11. The first is a simple electro-magnet with return pole-piece on which the armature plays on its lower edge. The other is somewhat different in its arrangements. When it is energised, the armature rises and an ebonite stud passing through the lower spring pushes the upper one away, thus breaking the contact. There are two sets of these springs mounted side by side.

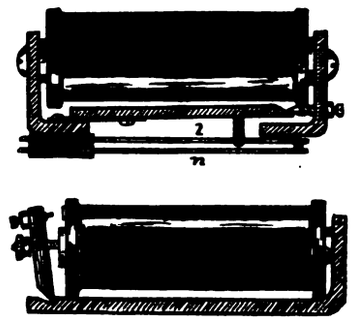

FIG. 11.

The essentials of the cord circuit are shown in Fig. 12. In the centre is the " repeating coil," an induction coil of equal windings each of which has to serve as primary or secondary as speech is uttered at one end of the circuit or the other. It really consists of two coils, but each is divided in two so that the battery may be inserted in the middle. From the upper end of each coil a connexion goes to the " supervisory " relay and thence to the tip of the plug. The lower end of each winding is taken to the ring whilst the shank is connected to one side of the supervisory lamp, the other

Digitized by Google

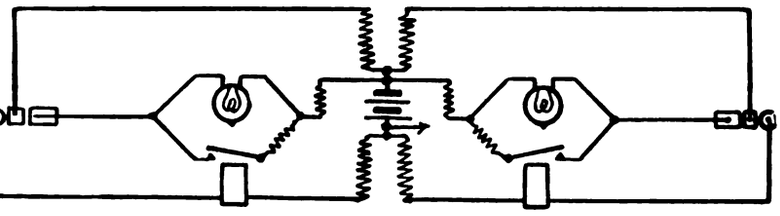

FIG. 12.

side going, *via* a resistance coil, to the negative pole of the battery. The armature of the relay, when attracted, puts a shunt across the lamp and thus extinguishes it. On the calling plug side a speaking and ringing key is inserted (not shown) by which the operator can come in circuit and by which she can ring up the required subscriber.

(*To be continued*).

DEWSBURY NEW EXCHANGE.

AN interesting event, reminiscent of pre-transfer days, took place at Dewsbury on Saturday, Oct. 28, being the occasion of the opening (involving the transfer of some 1,000 circuits) of a new C.B. (No. 1) Exchange.

Invitations to the function had been sent out in the name of "The West Yorkshire Telephone and North-Eastern Engineering Districts Headquarters' Staffs" to the Mayor, Mayoress and a number of prominent local officials and their wives. The Mayoral party, accompanied by the mace-bearer, reached the building at 2.45 p.m., in time for the opening at 3 o'clock. They were met at the entrance and conducted to the very commodious Switchroom where the assembly was held. The visitors were formally welcomed by the Surveyor and District Manager. The Mayoress, after opening the exchange and making the first call was presented by the Supervisor with a bouquet provided by the local telephone staff.

After the visitors had been "shown round" by officers of the Engineering and Traffic staff detailed for the duty, a short meeting was held in the retiring room—to give the opportunity for a few speeches—at which the Mayor presided. Afternoon tea, to which Yorkshire hospitality adds a ham sandwich and sausage roll, followed. After the visitors had left, further celebrations of the event took place in the shape of a second tea arranged by the local telephone staff for themselves and friends.

The new building was very handsomely decorated through the generosity of Mr. W. Ballance (florist), a Dewsbury subscriber, who "as a citizen"—to use his own expression—desired to provide the many beautiful ferns and palms which were so much admired.

The occasion was voted a great success by all concerned—as such it was The following chief officers were present:—

Survey Branch:—
Surveyor, District Manager, and Traffic Superintendent.

Engineering Branch:—
Superintending Engineer and Sectional Engineers.

Local Officials:—

The programme of the proceedings is appended, which may be of interest to those who have similar functions in view.

PROGRAMME OF PROCEEDINGS

on the occasion of the opening of the new Telephone Exchange at Dewsbury kindly performed by the Mayor and Mayoress.

HISTORY:

1880.

The first Exchange was opened in Dewsbury and was one of the earliest in the Country.

There were then 17 subscribers connected, operated by one Telephonist. There were no Trunk or Junction circuits.

1922.

The service has increased to nearly 900 subscribers; in addition to some 159 Junction and Trunk circuits.

The Exchange is staffed by 29 Supervising Officers and Telephonists.

PROCEDURE:

2.45. The Mayor and Mayoress will arrive at the building and proceed to the "Switchroom" with other visitors.

3.0 A few explanatory remarks will be made by Mr. T. A. Bates, Manager of Telephones for the West Yorkshire District, at whose request the Mayoress will press a button and give the signal for the transfer of the circuits from the old to the new Exchange.

After this has taken place the visitors will see the new Exchange in operation and will be given any information desired.

A visit will then be paid to the "Apparatus" room and the plant there explained.

3.30. In the staff retiring room the Mayor has kindly agreed to take the chair at a short meeting, when a few brief remarks will be made by the following:—

Mr. W. H. HANCOCK, Postmaster-Surveyor of the West Yorks District—Matters relating to the new Exchange.

Mr. O. P. LAWRENCE, Postmaster, Dewsbury—Will refer to the Staff.

Mr. E. S. FRANCIS, A.M.I.E.E., the Sectional Engineer, will thank the Mayor and Mayoress for their presence and give some particulars of the installation.

3.45. Tea will be provided.

THE C.T.O. BAZAAR.

THE dates, Nov. 15, 16 and 17, 1922, will live for many a year as red-letter days in the history of the C.T.O., London. In telegraphic history indeed, 1922 may possibly be known in the future as "Bazaar" year, for certainly this function has been the outstanding feature of the present year of grace.

There were certain of us maybe who had their misgivings regarding the possibility of reaching so dizzy a height as *thousands* of pounds may indicate to the statistician. If so we were badly yet gladly doomed to disappointment for as these lines go to the printers we hear that considerably over £3,000 has been realised and additional sums are still coming in.

The Memorial Hall proved all too inadequate accommodation for the hundreds of would-be visitors and buyers who surged up the steps and in many cases, alas, vainly tried to obtain access. The patronage of our ever-sympathetic Queen with her right welcome and appropriate gifts, the willing assistance of the Lady Mayoress, Lady Baddeley (late Lady Mayoress) and Lady Gwendoline Marshall all gave practical encouragement and added brilliancy, beauty and vivacity to each day's proceedings.

What of the trojan labours performed by the many willing workers, men and women alike, who, especially the latter, had for months past spent their time and energies upon scheming, devising and working on behalf of this great effort to aid certain London hospitals?

It would be invidious to pick out any particular stall-holder, concert-organiser or side-show proprietor for special praise where all laboured so whole-heartedly and unselfishly. The atmosphere of general satisfaction which prevailed when the last article had been sold on the last day of the function—a certain high functionary assuming the *role* of Dutch auctioneer—was typical of the splendid team-work which had gone so far in producing the finest effort ever made by the C.T.O.

THE RETIREMENT OF THE TRAVELLING SUPERVISOR, FIFE SECTION, EDINBURGH, DISTRICT.

ON Aug. 18, 1922, Mrs. A. H. Irvine, Travelling Supervisor for the Fife Section, who has been 35 years in the Service, was presented with a case of cutlery and a wallet of Treasury notes by the staff of the late Dundee Telephone District on the occasion of her retirement from the Service.

The presentation was made by Mr. Mackenzie, Postmaster, Kirkcaldy, who, in very appropriate terms, assured Mrs Irvine of the unanimity which characterised the movement culminating in this meeting of her old friends and well-wishers, who were NOS desirous that she should carry away with her some tangible expression of their kindly feelings and their sincere wishes for her future happiness.

Mr. Hastie, Contract Officer, who has been associated with Mrs. Irvine in the District during the greater part of her service, thanked the contributors on her behalf for their handsome gifts, and spoke highly of Mrs. Irvine's capabilities. Mr. Lambert, the Engineering Officer, also paid tribute to Mrs. Irvine's qualifications as a Supervising Officer, referring particularly to the invariable spirit of helpfulness and camaraderie which was ever present in the performance of her duties.

The meeting was also addressed by Mr. Lynch from the Traffic Office Edinburgh—one of the transferred Dundee staff—who spoke to the pleasant relations which existed between Mrs. Irvine and the other members of the staff, and who, on behalf of the members of the Dundee Traffic staff, wished her long life and happiness in her retirement from official duties.

Thereafter tea was served by Misses Telfer and Kirk, Supervisors of the Kirkcaldy trunk and local exchanges respectively, bringing a most enjoyable evening to a close.

PHONOGRAM WORKING.

BY W. C. GRIFFITH (*Headquarters Traffic Section*).

(Paper read before the Edinburgh Telegraph and Telephone Society.)

THE opening meeting of the 1922-23 session of the Edinburgh Telegraph and Telephone Society took place on Oct. 4, Major A. A. Jayne, Controller of Telegraphs, presiding in the unavoidable absence of Brigadier-General Price. There was a large and representative audience present to hear the paper submitted by Mr. W. C. Griffith (Headquarters Traffic Section) on "Phonogram Working, with special reference to Ancillary Equipment," and the interesting discussion which followed indicated that the functions of the Society, in stimulating the exchange of ideas on the various problems confronting the Telegraph and Telephone Services, were being fully recognised by the members.

Mr. Griffith said that a number of factors had contributed of late years to increase the importance of phonogram and telephone-telegram work. As regards phonogram working, the steady increase in the number of subscribers had necessarily tended to increase the number of telegrams handed in by telephone, while similarly increasing the opportunities for telephonic delivery of telegrams. As regards telephone-telegram work the development of the public telephone system had provided facilities for serving many small offices which it would have been unduly expensive to serve telegraphically. Later years too had brought a further development in the system of direct telephoning between comparatively adjacent offices in order to avoid intermediate telegraphic transmissions.

"It will perhaps," he proceeded, "be of interest if at this stage I comment upon the advantages of telephonic disposal of telegrams, and it will be convenient if in this connexion we consider phonograms* and telephone-telegrams separately."

The phonogram service is an obvious advantage to the public. It enables subscribers to hand in telegrams without leaving their offices and homes, and to hand them in at hours when they could not otherwise be despatched and to hand them in more quickly, in most cases, than they could be taken by messenger. Similarly it enables subscribers to receive telephone messages which might have taken longer to deliver by hand, and, after normal delivery hours, messages which would otherwise have been delayed till next morning. Further, phonogram services are paid by quarterly account instead of by cash payment for each transaction The advantages of the phonogram service from the point of view of the Department are less obvious but none the less real. It is clearly cheaper to accept a written and stamped telegram over the counter than it is to accept it by telephone, to write it down, and later to render an account and collect the charges, and were there no compensating advantage the phonogram service would clearly be an expensive facility to offer to the public. The compensating advantage lies almost wholly in the opportunity which the service affords for the Department to choose the accepting office—called the "appointed office." By concentrating the phonogram work of an area upon the main transmitting office a large number of transactions between small sub-offices and that main office may be eliminated. Detailed returns taken recently showed that of phonograms accepted at a number of representative offices 55 per cent. were from subscribers whose offices or homes were nearer to sub-offices than to the "appointed office" and it is reasonable to suppose that most if not all of these messages would have been handed in locally had the phonogram service not been available, and would have suffered an additional transmission. Studies of the costs involved, making full allowance for exchange switchings, junctions, &c., show that the saving on this 55 per cent. of the phonograms more than compensates for the loss on the other 45 per cent. We have then in the acceptance of telegrams from subscribers by telephone that rare combination of a special facility alike advantageous to the public and economical to the Department.

In considering the delivered phonogram service we are on more difficult ground, but fortunately we are able to discriminate comparatively freely as to which messages shall be offered by telephone and which shall be delivered by hand.

The telephone-telegram service offers advantages in a different direction. To the public they are indirect in that, as previously mentioned, the service enables many small telegraph offices to be opened which could not otherwise be served. To the Department the great advantage is that, by utilising existing telephone junction circuits the erection and maintenance of many long telegraph circuits can be avoided. As already mentioned arrangements are now being made to divert short-distance messages to direct telephonic transmission between office of origin and office of delivery with consequent acceleration.

Necessity for Phonogram Equipment.—It would be possible to give a phonogram service without further equipment than the provision of the necessary number of circuits between the telephone exchange and telephones on the phonogram positions, and such an arrangement is in fact standard where the number of such circuits does not exceed two. Reasons of economical working make the provision of some form of switching apparatus necessary at the phonogram positions in larger offices.

It has been decided as a matter of policy that subscribers ought not, except in very rare instances, to be told "Number engaged" when they call "Telegrams." The reasons for this are obvious. The Department ought to set an example in providing adequate circuits for its traffic, while subscribers who want to send telegrams, which are of their nature urgent communications, naturally chafe at delays in handing them in. Operating conditions in telephone exchanges are such that telephonists have no facilities for holding over, for even brief periods, calls which cannot be completed on demand. Accordingly phonogram circuits must be provided on a basis which will ensure that it shall, except in rare instances, always be possible to give connexion to one on demand. At the phonogram positions, however, there is not quite the same necessity for an absolutely instantaneous answer. The answer of a phonogram telephonist to a demand from a subscriber for "Telegrams" is equivalent from the point of view of the subscriber to the answer of a called subscriber. The average time taken to answer the bell by a called subscriber is about 12 seconds, and the service may be regarded as reasonably good if the period which elapses between the time when the exchange operator calls on a phonogram circuit and the time when the phonogram telephonist answers does not exceed this figure. This period of permissible delay may be utilised to achieve very appreciable staff economy by allowing incoming calls to be "held over" for brief periods so that by overlapping, the load may be "evened up," and the calls, after waiting their time, be handled by phonogram telephonists, who, though perhaps engaged when the calls were made, have become free in that waiting period. The same result could be achieved if each phonogram circuit from the exchange terminated on a separate instrument and the staff moved about from instrument to instrument. Such an arrangement would obviously be unsatisfactory, and hence the provision of concentrating equipment.

Types of Phonogram Equipment.—Two distinct types of concentrating equipment are used for phonogram work, the older form, the concentrator, being gradually displaced by the newer form, the ancillary panel.

The "concentrator" is a small switchboard equipped with jacks and indicators (magneto or lamp) upon which terminate the exchange circuits, and single cords upon which terminate the lines from the phonogram positions. This type of equipment achieves its purpose but, except in the very largest installations the switching load, even in the busy hour, is insufficient to employ the concentrator operator fully, and in practice therefore she is expected to handle messages also. This arrangement is open to the objection that her attention is divided between two quite dissimilar duties, and it is difficult for her to perform either with full efficiency. A simple development of this system in offices where there are three phonogram positions is to place the concentrator on the middle position and require each telephonist to operate her own calls. This the two end telephonists can readily do by reaching in front of the middle one, and this arrangement completely overcomes the objections to making only one telephonist responsible for the switching. The operating of an ordinary concentrator by each telephonist for herself is however restricted, by limitation of reach, to three positions. The logical development along the same lines is the evolution of ancillary equipment.

The primary feature of ancillary equipment as applied to phonograms is that it is arranged that every calling signal appears before every phonogram telephonist. This is arranged by placing on the centre position of each group of three positions a panel upon which appears every circuit, whether incoming or outgoing—in fact by repeating the whole "concentrator" every three phonogram positions. Each calling signal is thus given simultaneously on every panel, and, since the telephonists on each side of the centre position of each group of three can easily see and reach the panel on the centre position it follows that every telephonist is in a position to answer every call. Similarly all outgoing circuits appear on every panel and every outgoing circuit is thus directly available to every telephonist.

This type of equipment has the great advantage that during slack periods of the day it may be closed down position by position by withdrawing staff until in the limit the whole of the work can be performed from any one panel without any reference to the other panels which there may be.

The ancillary system has now been adopted as standard for all but the very largest installations.

Standards of Service.—In order that a uniform standard of service may be given in both small and large towns variation in the load of the phonogram telephonists is necessary. It will be obvious that in a large installation the chances that a telephonist is free at the moment at which a call is received will be greater than in a small installation, and similarly if all the telephonists are engaged at the moment at which a call is received, then the chances are that one will become free to take the new call sooner in the case of a large installation than in a small. In order to compensate for this and so to give a service of approximately uniform quality it is necessary to reduce, in the case of small installations, the chances that all the telephonists shall be engaged when a call is received, *i.e.*, to reduce the load, so that on a larger proportion of the calls there shall be a very quick answer (theoretically instantaneous) on those calls received when a telephonist is free, to balance the inevitably slower speed of answer on the remaining calls which mature when all the telephonists are engaged. (It will be observed that this arrangement, while it may preserve a uniform *average* speed of answer in small and large installations cannot prevent the maximum fluctuations from that average being greater in small installations than in large).

In the foregoing remarks the references to "large" and "small" installations apply not only to offices of different size but also to the varying conditions which occur throughout the day within any one installation due to varying load. The conditions at an ancillary installation with, for

* Phonograms are telegrams passed by telephone between the public and the Post Office.

Telephone-telegrams are telegrams passed by telephone between two Post Offices.

Digitized by Google

example, ten positions when only three are staffed are precisely the same as those at another office with only three positions when all are staffed.

The fact that a large phonogram installation can thus be staffed much more efficiently than a small one for the same quality of service is of great importance. If the load per operator attainable when five positions are staffed is represented by 100 units, then it is considered that the load per operator when only one position is staffed, to give the same average quality of service, must be only 60 units, which is a strong argument for concentrating phonogram work on big offices.

From another and equally important point of view concentration of phonogram work is advantageous. The general system of telegraphic circulation is now such that minor offices are normally connected to their group centres, which either are, or have outlets to, area centres and these in turn to zone centres. If then phonograms can be concentrated upon the highest possible class of office one and sometimes two telegraphic transmissions may be saved. The extent to which concentration can be carried is, however, clearly limited by considerations of the cost of the telephone circuits which must be provided for this traffic—that is, in effect, by distance. The limiting economical distance in turn depends upon the proportion of messages saved a transmission by concentration on a more distant office with superior outlets.

These factors have therefore led quite logically to the system of "appointing" certain offices, chosen to suit the convenience of the service, to accept telegrams from subscribers, and the natural tendency is to decrease the number of such offices.

Delivery of Telegrams by Telephone.—The extent to which telephonic delivery of telegrams is practicable depends upon the willingness of subscribers to accept their messages in this way. There are always subscribers who will not accept telegrams by telephone, either for fear of mistakes or loss of secrecy or because the number is so great as to make too much demand upon the time of the employee who takes down the messages, and upon the subscriber's telephone circuit.

The conditions under which, broadly speaking, it is and is not economical to deliver telegrams telephonically depend upon (*a*) the distance of the address from the office of delivery; (*b*) the type of address; (*c*) the size of the town; (*d*) the necessity or otherwise for transmission from the head office to a sub-office for delivery.

(*a*) THE DISTANCE OF THE ADDRESS FROM THE OFFICE OF DELIVERY is a fundamental condition in the economy of telephonic delivery. It may be taken that it is normally more economical to deliver by messenger with ½-mile radius than to deliver by telephone, and in certain circumstances this radius may be greatly increased.

(*b*) TYPE OF ADDRESS.—There are three types of address:—
Full.
Registered.
Telephonic.

The difficulty, and therefore cost, of segregation of telegrams for subscribers from those for non-subscribers depends upon the type of address employed.

Full Addresses.—Reference to a directory in the case of every telegram is necessary.

Registered Addresses.—Reference to the registered address list shows the telephone number and postal address, and segregation is automatic.

Telephonic Addresses.—No reference is necessary to ascertain whether the addressee is a subscriber, or his telephone number, but a reference is necessary to ascertain the postal address to which the confirmation copy must be sent.

On the whole the most convenient form of address for telephonic delivery is the registered address.

(*c*) THE SIZE OF THE TOWN has a considerable bearing on the question. In small towns the circulation officers get to know without reference the names and telephone numbers of regular users of the telegraph service and pick out their messages without expenditure of time or effort. In large cities the matter becomes beyond the capacity of memory and reference to a directory is necessary.

It may, therefore, be said that except in small towns it is uneconomical to pick out fully addressed telegrams for delivery by telephone within the normal hand delivery area of the main delivery office.

(*d*) THE NECESSITY OR OTHERWISE FOR TRANSMISSION FROM THE HEAD OFFICE TO A SUB-OFFICE FOR DELIVERY has a great bearing on the question of economical telephonic delivery. It may be taken that, where an additional telegraphic handling may be saved by direct telephonic delivery from the head Post Office, then that form of delivery is more economical (as well as more expeditious) within a radius of about 20 miles than transmission by telegraph to a sub-office and subsequent hand delivery.

Direct Disposal of Telegrams between Adjacent Offices.—The public, somewhat naturally always expects a telegram to a place comparatively near to be delivered more expeditiously than one to a more distant place, although in practice the short-distance message may require quite as much handling as the long-distance message if passed through the ordinary channels of circulation—in fact it may often require more. With the object of reducing as far as possible delays on short-distance messages, as well as of economy in handling, arrangements have recently been made for short-distance messages to be telephoned direct between office of origin and office of delivery when both are connected to the public telephone system and no direct telegraph circuit exists.

Counterfoil Forms.—There has been under trial for some months in the Central Telegraph Office a combined form and ticket for phonograms, or, as I think it might preferably be described, a phonogram form so designed that the portion which relates to the fees can be detached and sent to the Telephone District Manager, and the message itself sent to the instrument room. The aim in designing this form to avoid the manuscript duplication of any item on both main form and counterfoil, in order to save unnecessary labour (which involves increased circuit holding time) and to prevent the errors which now arise from copying the information from the form on to a separate ticket. The subscriber's number accordingly appears only on the counterfoil. Re-association of form and counterfoil, if necessary, can be made by means of the serial number, which is stamped on both.

The question of introducing the form generally, is still under consideration.

Phonograms from Coin Box Call Offices.—It has been suggested that the public shall be permitted to use any coin box call office circuit for the purpose of handing in telegrams. The proposal may sound a little revolutionary in that it would in effect make every call office a telegraph collecting office, but it has much to recommend it. There are many districts, particularly in the suburbs of large towns, where call office facilities are available and where the nearest telegraph collecting office is some little distance away, and at night and on Sundays this condition is very common. It would be an undoubted convenience to the public in such cases to be able to use the call office to hand in telegrams, which at such times may be assumed to be specially urgent. The difficulty lies in the fact that the fees would have to be collected in pence, and as the usual call office fee would of course be charged the caller would have to provide himself with at least fifteen pennies (twenty-one on Sundays). If, however, he is able to fulfil this condition there seems no reason for refusing the messages. The fact that the call office fee would be payable in addition would automatically restrict the use of the facility to reasonable limits. The matter is under consideration.

The paper was followed by an interesting discussion in which Major Jayne and Messrs. Moncrieff, Potts, Rankine, Mendine and Davis took part.

The syllabus for the current session so far as it has been completed includes Lieut.-Col. Crawley, M.I.E.E., etc., on "Wireless Communications" (Nov. 7); Miss Norah Milnes, B.Sc. Director, School of Social Study and Training, University, Edinburgh, on "The Economic Position of Women" (Dec. 5). "The Murray Multiplex," by W. P. Morris, Esq., of the *Scotsman* (Jan. 9), and "The Working of a Large Telephone Exchange," by W. C. Yarroll, Telephone House (Feb. 6). Subject for the meeting on March 6 has yet to be fixed.

TELEGRAPHIC MEMORABILIA.

THE broadcasting of films in the near future may seem to be a rather far-fetched proposition even to those who may have ceased to marvel at any development of radio-communication. This, however, is prophesied by the Society of Motion Picture Engineers of America as a certain achievement during the next year or two. Telephotography, however, has of late become considerably simplified and at least one system is known to exist which by means of the five-unit telegraph code an high-speed telegraph apparatus is capable of transmitting over long-distance wires certain signals. These signals can then be reduced to minutely fine degrees of light and shade by means of ancillary apparatus at each end of the circuit. Now any telegraph apparatus workable through a metallic circuit can also be worked with the ether as a medium of transmission. While the writer does not profess to be in the slightest manner acquainted with the method likely to be adopted for this particular broadcasting of films, nevertheless, the possibility of such a development is assuredly well within practical limits. Whether financially the scheme would prove a sound proposition is quite another matter.

The opening meeting of Session 1922-23 of the T. and T. Society at the Institute of Electrical Engineers on Oct. 23 was conspicuous by a good attendance of the membership. Sir Henry Bunbury, K.C.B., the Chairman for the year gave an extremely interesting address on "Technique" which once the audience had warmed to its work gave rise to some interesting comments from Mr. F. J. Brown, Mr. John Lee, Major Brown and others. The suggestion by one of the younger members of the audience that when a junior officer was first introduced into a department he should be shown not only the routine of his own particular work as a junior but should also be shown in a general way the connexion between his own special job and that of the organisation of which it formed a part, did not receive the attention which it deserved. This is not to say that there was any lack of sympathy towards the idea. It was in fact due rather to the lateness of the hour at which it was made. In at least one department of the C.T.O. this principle is actually carried out with every new entrant who is escorted from point to point by an experienced officer of supervisory grade, who explains the general lay-out of the department, the functions of each section and their relationship to the whole. This occupies say a day or two. Thus, the novice from the first is able to seize the idea that the simple task allotted him has a definite relationship to every other function which he sees in operation around him. The time spent on this introduction repays itself manifoldly.

The impression one carried away from the gathering was that of the genial personality of the new Chairman whose key-note was struck and

Digitized by Google

sustained throughout in the crisp sentence when speaking of the staff of a department, "we are dealing with human nature not with a machine."

The recent meeting of the Eastern Telegraph Company which authorised the declaration of a 10 per cent. dividend free of tax, the carrying to reserve of £500,000, and the carrying forward of £568,000, would appear to be a highly satisfactory result of submarine telegraph cable working. It certainly shows no signs yet of the competition of any of the wireless services. At least that is the presumption for the report now lying before the writer only comments on the money spent on cable renewals, new cables laid, the extension of automatic telegraph apparatus and the bringing up of the staff to its full complement, and that the company's landing licences on British territory had been extended for a period of 25 years.

The Board, however, appears to be just a little hurt at the Government competition for Australian traffic, which is perhaps natural.

When addressing the cadets at the Royal Military Academy, Woolwich, some short time ago, Lord Cavan, Chief of the Imperial General Staff, referred to the heavy casualities among men burying telephone wires during the war, and said that the Army Council had decided that in future wars there would be no telephone wires from "division" to the front line; therefore officers should obtain a knowledge of wireless.

Another Authority recently stated:—

> "In the next war, so far from universal wireless communication being the rule, for practical purposes *there will be no wireless.* The earth's ether will simply be *jammed* by both sides, and that will be the end of *that.* Hence, cable development should be pressed strenuously forward."

So there you are. You pay your money and you take your choice.

One thing is fairly certain. The unceasing efforts made by wireless experts to minimise outside interference has led to much greater knowledge of the possibilities of *jamming* than existed during the last war.

To the Managing Editor:—I do not know whether it is the levity of our friends, the ladies of the Telephone Service, which leads me, a mere man, to claim equality of sex as regards a writer's privilege or whether it is the approach of Merry Yule-tide, but having obtained the kind permission of the Editor of the *Cable Room Monthly* to publish the following piece of fun and frolic from its pages, I am presuming your permission by sending "How Bill Adams Whacked the Macaroni," to the printers for insertion in the December' column of Memorabilia. I may say that the article was written after reading some complimentary notes on the excellent work of the Government staff when dealing with certain wireless traffic. Begins:—

"It was like this, sir, I was having a look at the Circular and reckonin' my chances for one o' them Postmaster jobs, like Liverpool, five pun a day an' find yer own grub, when a chap came runnin' up like as if he'd lost his train or forgot to pay the waitress; out o' breath 'e was so's 'e could hardly stutter, and 'e ses 'Bl'Adams,' ses 'e, 'Cap'n wants yer.' 'Send 'im along my man,' I ses. 'Nunno,' ses 'e, 'come up to Leafield quick.' An' when 'e ses 'Leafield' I smells the rat. 'Right,' I ses, 'get a move on yer.'—And off we pelts to the scene o' action. There was Cap'n and all the bhoys lookin' mad an' paper runnin' at 500 a minute. As soon's they saw me they roared. Up I steps to Cap'n an' salutes an' ses, 'here I be Cap'n,' I ses, 'ready an' willin' to show you 'ow to whack anybody an' anythin', an' earn your economies like I got Wellington's at Waterloo. Wellington ses, Sergeant Adams, ses 'e:—'all right,' ses Cap'n, 'never mind Wellington, think of Halifax. 'Ere's Macaroni turnin' out a hundred a minute and we want to beat it.'—'Just leave it to me Cap'n,' I ses, 'just you all stand round and see me do it.' So 'e showed me about fifty rolls of paper, an' 'e ses they was press. So I ses, 'we'll see to that presently; you go and shout down to the engine-room an' tell 'em to shove every bit o' coal on the fire, an' let me 'ave plenty o' juice,' I ses. So in about five tics the aureoole began to buzz like a mad cat, an' I gets hold of the thing they calls the key an' pushes it down at a eluvarate. The sounder gives a screech, which Cap'n ses means 'you're too slow,' ses 'e. Cap'n, 'e wants me to push the rolls of paper along, but I ses, 'no,' ses I, 'the humin 'and is the most perfick thing in nature,' ses I, 'an' shall it be beat by holey paper,—not likely,' an' I starts off again at 100 words a minute. That bloomin' sounder screeched again; and Cap'n 'e went mad and ran round the room twice. So I speeds up to 150, and the aureoole smoked and looked as if it was goin' to melt; and down in the engine room the poor beggars wa shovelling coal by the ton, to kep the juice movin' for them 200 words I was sendin'. The sounder screeched 'you're not fast enough'; Macaroni's in front of yer by two pages.' So I pushes out 250, and the floor shook so's Cap'n had to dance to keep still. 'Faster, faster,' he yells, 'Macaroni's 500 words ahead.' So I plugged in 300, and the fire brigade come down the street thinking the aureoole was afire. The table began to crack, and the chaps in the engine room fell down dead. Still Macaroni was in front. But I was just gettin' in form, and slammed that knob at 400 a minute, if I did one, sir, and never a lie about it.

"I was on the last page, and sounder, he yelled Macaroni was too. The engines was red hot, and the water in the radiators boiled over. There was chunks fallin' out o' the wall: Cap'n's hair was turnin' grey, and the boys was all slid off to the King'd Hed. 500 I was doin' now, sir, with half a page to go, and the fire engines was coming up all over the place. 10 lines—and up come the escape! 9 lines—and the sky was full o' sparks! 8 lines—and Cap'n's finger fell off! 7 lines, and Sounder yells, 'Macaroni's only one line afront'; 6 lines, and St. Paul's roof was afire! 5 lines—the firemen smashed the windows! 4 lines—Cap'n yelled, and fell out, head first; made me larf so, I lost 'arf a word: 3 lines, and there was such a mob the police had to charge them: 2 lines, and we was neck and neck! larst line, Macaroni guv' a groan—and I finished that line by meself, sir.

"That's 'ow we whacked the Macaroni, sir; whacked 'em 'ollow, we did: it was vairy dry work, sir; beggin' your pardon, sir; I've felt thirsty ever since. Thank you kindly, sir."

According to the Commerce Department of the U.S.A. the telephone system of Esthonia leaves rather much to be desired. This was of course a relic of the old Russian *regime.* The only connexion with other countries is one with Petrograd and a second is with Helsingfors by means of the submarine cable. The present central office equipment is a veritable hotch potch. Some parts are of old Russian material, the cables are of German manufacture, the connecting wires are Swedish and the remainder of the apparatus is apparently the product of the Esthonian factory in Dorpat. There are a few underground cables but not being laid in conduits it is not always easy to find them! In these circumstances it is satisfactory to learn that the Esthonian authorities have a scheme on foot for re-organising and renewing the entire system. A switch-board for 25,000 subscribers is mentioned as being part of the plan.

The history of the submarine cable has been full of romance and has fascinated some of the biggest financiers by its possibilities. The writings of Roland Belfort to whom we have previously been indebted for other interesting information have reminded me that perhaps the most sensational financial submarine cable *coup* was that of Jay Gould, who in 1882 suddenly decided to satisfy one of his ambitions by laying two cables across the Atlantic. Without further hesitation he cabled from America to Siemens of London asking for an estimate for "making and laying two Atlantic cables." Siemens replied with a promptitude rather betokening that Atlantic cables were a stock line that the order could be executed for something considerably over £1,000,000. With equal promptitude Gould replied:—"Fifty thousand pounds paid to your bankers here. Make and lay two cables according estimate." The work was put in hand forthwith!

The article in last month's issue on "A Universal Five-Unit Code for Printing Telegraphs" has been read with exceptional interest by a number of telegraph authorities. The only criticism that has come to my knowledge concerning it is the comment that tables of "letter frequency" to be reliable should be based on a wider basis than one short leading newspaper article. No doubt Mr. Thompson will be able to enlighten our readers as to whether the tables given are based on the averages of a number of leading articles or simply upon one sample taken haphazard from newspapers of the respective countries mentioned. The October number of the *P.O. Electrical Engineers' Journal* also contained an article by A. C. Booth on the same subject. The latter takes the view that the Baudot code should be the one adopted for international use as being that likely to cause the minimum disturbance in the telegraphic world by its adoption. Mr. Booth maintains that "the large number of present-day business telegrams, consisting of ten-letter code words made up with a high proportion of the less frequently used letters, entirely destroys the basis of the allocation of both the Murray and Siemens' alphabets."

Electricity, in a paragraph or two regarding "Broadcasting Risks," warns the amateur against certain dangers attending the careless erection and use of apparatus. The following few lines may prove not without their value, even to those of our craft whose familiarity should itself remind them of the necessary precautions to take.

> "There is the risk attendant upon the use by some amateur experimenters of the house wiring system as a sort of network aerial. Special connectors are marketed enabling the wireless set to be connected up to any convenient lamp-holder or wall socket by the insertion of a plug connector. Unless these devices are designed with an ample margin of safety and barrier insulation, the practice is likely to cause accidents in certain circumstances. Finally, there is the danger attendant upon an unearthed aerial during thunderstorms. Every wireless aerial should be furnished with simple facilities for earthing when not in use, and, to ensure safety, it is as well to install one of the better-class lightning protectors as used in connexion with telegraph or telephone circuits. Such apparatus, designed for this specific purpose, will automatically shunt a lightning discharge to earth should the aerial function as a conductor, and may well save its nominal first cost many times over in the first twelve months of broadcasting."

The Inaugural Address of the I. E. E. for 1922 given by the president Mr. Frank Gill, O.B.E., was eminently scientific both from the economic and the electro-technical standpoint. It was also pre-eminently simple and direct in its diction though dealing with the highly technical subject of long-distance telephony. Mr. Gill naturally admits the difference of conditions obtaining when he urges the necessity of unity of control in trans-European communication as the key to efficient and economical long-distance circuits. His proposals are "To operate all the through business both within and between the various countries in Europe, by a single long line company working under licences from the various governments, taking the calls from the local originating organisations and being entirely responsible for them until turned over to the local receiving organisations." This arranged there would be no insurmountable problem in establishing direct telephonic communication between London and say Delhi, Calcutta or Rangoon, as part of the daily routine of the Central Exchange.

Mr. Gill proposes a conference of all the European telephone authorities including Great Britain, companies, municipalities and Government departments to study the problem in detail. In the U.S.A. utilising the "carrier system four wires between Chicago and Omaha, to London (450 miles about) produce 27 separate communications, *i.e.,* 2 physical telephones, 1 phantom ditto, 4 earthed telegraph circuits (workable one-way or two-way) and 20 two-way carrier telegraph circuits.

Digitized by Google

Mr. Gill's enthusiasm for his calling is well-known, but it is feared that even that quenchless fire would become damped if instead of the one-tongued hearty unified co-operation of trans-America he had to deal with a dozen nationalities, speaking as many languages, with purses more or less filled with paper money, and with differing national ideals as regards the value of an international communal communication service.

Unified control of international communications, railways, telegraphs and telephones is not altogether a new proposition. One recognises therein a splendid ideal and we here in Europe look wistfully across the Atlantic where these conditions are realisable, comparatively with a stroke of the pen.

As to Conferences, even in Telegraph Conferences and their Convention there is a latter-day tendency to ignore some of the most salient regulations to which the high-contracting parties have placed their signatures.

According to *Reuter's* agency a committee has been formed for holding a Wireless Telephone and Telegraph Exhibition in Geneva some time during 1923.

The same authority tells us that the new Fascist Prime Minister proposes to hand over the postal, telegraph and telephone services to private enterprise as these services are at present being run at considerable loss.

Is the following quatrain any use to telegraph canvassers ?

"The man who whispers down a well
About the goods he has to sell,
Will never gain the golden dollars
Like him who climbs a tree and hollers ! "

The office of origin is said to be New York !

Mr. F. J. Muller, Assistant Superintendent of the C.T.O., London, retired upon reaching the age-limit on the 13th of last month. Fred leaves behind him a reputation and a record of efficiency of which anyone may well feel proud. His knowledge of the C.T.O. and its circuits was always well abreast of the latest developments and changes which is high tribute during the last decade or two. He leaves us with nothing but the best of wishes for a long and happy autumn of life from all. Many of us will always recall his helpfulness and willing co-operation in official difficulties with abiding pleasure and no small appreciation of cheerful service rendered.

The following conventions have been entered into between the Marconi Company and the respective Governments concerned. Portugal, for wireless stations to be erected at Lisbon, Madeira, Angola, Mozambique and the Cape Verd Islands, and South Africa, for a specially high-powered station capable of communicating with England. The *Electrician* states that it would be double the power of Ste. Assise near Paris. In the case of the former country the contract is for 40 years and in that of the latter for a period of ten years with the right of expropriation at the expiration of that period or renewal of the license every ten years whichever may prove the more acceptable alternative from the Government's point of view.

If the facts could be published I am fairly well confident that wireless proved a very considerable help during last month's critical time in the Near East. The only thought that struck one as the broadcasting nature of the transmission was realised, was the absolute lack of actual secrecy, as against submarine cable transmission. Experts maintained during the war that there is no cypher code that cannot be deciphered and even Siemens or Baudot or Teletypo or Murray or Western Electric, fitted with change-over shifts for coding and decoding would not in the long run during war-time remain unassailable as regards the secrets they held.

The Western Electric Company's multiplex is now being installed in the Cape Town C.T.O. Our South African correspondent adds the information that some of the younger members of the staff are being trained at the Yost Typewriting School, but he does not indicate the centre with which Cape Town will open this experimental circuit.

Much has been said from time to time as to the exploits of the older school of telegraphists in manipulation. Possibly fancy has at times woven something in the nature of a fantastic story as is the wont of the affectionate concerning the object of their *amour*. Be this as it may, it is becoming more and more evident that the younger generation is not to be denied. Their zeal has been particularly evident these last two or three years with regard to growing expertness in connexion with the working of foreign circuits, Paris Stock Exchange (Hughes), Berlin (Siemens), and Amsterdam (Baudot), and even more latterly the handling of the Banbury wireless program.

Another leaf was recently added to their crown of laurels by the particularly smart management of a defective cable wire between London and Antwerp, and the excellent result (notwithstanding the natural difficulties) of, at times, just a fraction over a message per minute.

Life, the Immeasureable.—There is plenty of physics and chemistry and mechanics about every vital action, but for a complete understanding of it something beyond physics and chemistry is needed. . . . The behaviour of a ship firing shot and shell is explicable in terms of energy, but the discrimination which it exercises between friend and foe is not so explicable. . . .

Life introduces an incalculable element. The vagaries of a fire or a cyclone could all be predicted by Laplace's Calculator, given the initial positions, velocities, and the law of acceleration of the molecules ; but no mathematician could calculate the orbit of a common house-fly !

Oliver Lodge.

Science depends on measurement, and things not measurable are therefore excluded, or tend to be excluded from its attention. But Life and Beauty and Happiness are not measurable. . . If there could be a unit of Happiness, politics might begin to be scientific.

A. J. Balfour.

J. J. T.

PROGRESS OF THE TELEPHONE AND TELEGRAPH SYSTEM.

DURING September, for the first time in the history of the Post Office Telephone system, the number of working stations exceeded a million, the total at the end of the month being 1,005,773. Of this total 360,753 were connected with exchanges in the London Telephone area and 645,020 with provincial exchanges. Outside London the Telephone District with the largest number of stations is Manchester with 51,980, Liverpool coming next with 46,976, and then follow Glasgow, 44,894, Birmingham, 36,484, Leeds 34,308, and Edinburgh, 31,455.

It may be of interest to record that the total number of stations in the combined Post Office and National Telephone Company's systems at Jan. 1, 1912, was approximately 690,000 ; and that, allowing for the transfer of the Hull and Southern Ireland systems, the total has been increased by 50 per cent. since the transfer, despite the intervention of four years of war, when development was necessarily suspended and when practically the only new circuits provided were those essential in the national interests.

The local and trunk traffic, which showed the usual seasonal fall in August and September, give signs of a recovery and possibly of a slight increase in October, but there is not yet any indication of a substantial improvement in the calling rate. The gain is rather more marked in the trunk than the local traffic.

Some statistics showing the general development of the service during the 6 months ended Sept. 30 last are given in the appended table :—

	Total at end of—					
	April.	May.	June.	July.	Aug.	Sept.
Exchanges	3,112	3,116	3,115	3,113	3,114	3,116
Exchange stations ...	942,671	947,534	953,931	957,476	962,852	969,126
Private wire stations...	36,960	36,934	36,810	36,627	36,578	36,647
Call offices (stations)...	15,405	15,487	15,573	15,667	15,755	15,838
Call offices in street kiosks	275	289	305	317	327	335
Rural party line stations	3,747	4,101	4,408	4,671	4,894	5,191

Further progress has been made with development of the local exchange system. Among the more important new exchanges opened are the following :—

Provinces.—Bolton, Dewsbury, St. Albans, Chorlton-cum-Hardy.

The following important exchanges have been extended : —

London.—Palmers Green.

Provinces,—Leicester, Gt. Yarmouth, Jesmond (Newcastle-on-Tyne), Leeds, Sunderland, Sheffield (Central).

The main underground trunk system has been extended by the completion and bringing into use of a new cable between Birmingham, Wednesbury and Wolverhampton.

During the month of October 18 new overhead trunk circuits were completed and brought into use.

A PERFORMANCE which is perhaps somewhat noteworthy in the telegraph world was accomplished at Newcastle-on-Tyne on Nov. 7 in connection with a speech made by Mr. Lloyd George. The ex-Premier's speech which occupied one hour in delivery was signalled in its entirety over a circuit made up to include six other offices, within 100 minutes (99 minutes to be exact) of the text being handed over to the Post Office ; and not a single correction or repetition was required by any office concerned. Eight S. C. and Ts. (four of them ladies) and a male learner were the officers concerned at Newcastle. Most of the Wheatstone slip used was punched by Gell perforators and at all of the distant stations Creed perforators were probably used.

About twenty years ago such an occurrence might have occasioned the attendance of special staff from other offices, and whether or not this occurred, it would probably have been considered necessary to fit up a second complete circuit for the purpose of giving repetitions. Such a case of no repetitions in a message of this length and no stoppages during the vital period on a circuit embracing several stations affords a good testimonial to the smooth working of the apparatus and to the efficiency of the staff employed.

J. WEBSTER,

P.O., Newcastle-on-Tyne, Nov. 20, 1922.

The
Telegraph and Telephone Journal.

PUBLISHED MONTHLY IN THE INTERESTS OF THE TELEGRAPH AND TELEPHONE SERVICE, UNDER THE PATRONAGE OF THE POSTMASTER-GENERAL.

Editing and Organising Committee - - - J. STUART JONES. JOHN LEE. J. J. TYRRELL. W. A. VALENTINE. J. W. WISSENDEN.

Managing Editor - - W. H. GUNSTON.

NOTICES.

As the object of the JOURNAL *is the interchange of information on all subjects affecting the Telegraph and Telephone Service, the Managing Editor will be glad to consider contributions, and all communications together with photographs, diagrams, or other illustrations, should be addressed to him at G.P.O. North, London, E.C.*1. *The Managing Editor will not be responsible for any manuscripts which he finds himself unable to use, but he will take the utmost care to return such manuscripts as promptly as possible. Photographs illustrating accepted articles will be returned if desired.*

VOL. IX. DECEMBER, 1922. No. 93.

BROADCAST MUSIC—CONCORDS AND DISCORDS.

IN an article in the *Wireless World* of Nov. 18, "H.S.P." urges that broadcasting is likely to "crowd out" the experimenter in continuous wave reception because he is forbidden to use reaction at all on the band 300-500 metres during broadcasting hours (5 p.m.-11 p.m.), that the Post Office is turning down applications for experimental licences wholesale, and that wireless manufacturers are losing their old-established businesses in experimental apparatus and are forced to enter the field with broadcast receiving sets in order to secure a share of the industry.

Doubtless these serious allegations were made in good faith; but, unfortunately for "H.S.P.'s" arguments, the facts do not coincide with his statements.

The condition as regards reaction is given below, and it will be seen that it contains no prohibition of reaction or of heterodyne arrangements. The terms of the condition were settled after full consideration with the interests concerned, and are not unreasonable if broadcast programmes are not to be failures. "H. S. P." will himself remember that during recent programmes repeated appeals were necessary to amateurs on account of gross interference by direct reaction.

The condition reads as follows :—

> The apparatus shall be used in such a manner as to cause no interference with other stations. In particular, between the hours of 5 p.m. and 11 p.m. on week days and all day Sunday, any oscillating valve or valve circuit employing magnetic or electrostatic reaction must not be directly coupled to the aerial or the aerial secondary circuit over the range of wave-lengths between 300 and 500 metres. The use of separate heterodyne circuits coupled to the aerial or the aerial secondary circuit over the range of wave-lengths between 300 and 500 metres is similarly restricted.

That is to say :—

> (1) Any reactive arrangement or a separate heterodyne oscillator may be used directly coupled to the aerial or the aerial secondary circuit on all waves at all times, with the exception of the range of wave-lengths between 300 and 500 metres provided no interference is caused with other stations.
>
> (2) For the range of wave-lengths between 300 and 500 metres—
>
> (*a*) The use of reaction or a separate heterodyne oscillator as in (1) is permissible between the hours 11 p.m. and midnight and from midnight till 5 p.m., Sunday excluded.
>
> (*b*) The use of reaction as a separate heterodyne oscillator directly coupled to the aerial or the aerial secondary circuit is not permissible between the hours 5 p.m. and 11 p.m. on week days and all day Sunday. If the use of reaction or a separate heterodyne oscillator is desired on these waves during these hours, the reaction or separate heterodyne oscillator must be so arranged that a valve is interposed between the aerial circuit or circuits and the circuit to which the reaction or separate heterodyne oscillator is coupled.

On the second count of the indictment, the Post Office can fairly plead "not guilty." During the twelve months ended on March 31 last 4,000 experimental receiving licences were granted and during the seven months ended on Oct. 31 over 10,000 have been granted. We appreciate the interest in the art of wireless created by the present boom and its undoubted educational value, but even so we feel some doubt whether the inclination to carry out serious experiment has spread thus like wildfire throughout the community. We would suggest that the growing desire for experimental licences is a direct result of the attractive broadcasting proposals, and the applicants prefer an experimental to a broadcast licence mainly because of the persistent boosting by the trade of sets and component parts which are not covered by the "broadcast licence," and of the technical (!) advice in the non-technical press that an efficient set can be made for a mere song out of a tobacco tin, half-a-dozen french nails or hairpins, a piece of cardboard, and the remnants of an old spring mattress.

Lastly, the number of potential customers for experimental apparatus has in fact increased exceedingly.

INTERNATIONAL TELEPHONY.

MR. FRANK GILL'S inaugural address to the Institution of Electrical Engineers, of which we publish an abstract in another column, re-opens the interesting subject to which we referred last month : the improvement of telephonic communication between this country and Europe. We agree with him that this can only be realised by definite and unified planning throughout the area to be served, and naturally we give preference to the third of his suggested methods of effecting this much-desired end, viz., by the formation of an association by the various European telephone-owning authorities to study the problem in detail and to endeavour to find a solution of the problem. Indeed, we have good warrant for saying that the British Administration would cordially welcome such co-operation with foreign Administrations and is only too eager to support any comprehensive scheme for the improvement of international telephony which may prove to be feasible.

Recent advances in the art of telephony, especially the increase in the range of long-distance speaking by means of repeaters, have rendered surprising developments possible, and there seems to be no physical, as apart from an economic reason, why the most

Digitized by Google

civilised and populous parts of Europe should lag behind America in this respect. We do not think, however, that the intervening space between London and Bagdad or London and Delhi can be compared with that between New York and San Francisco or Key-West—New York—Los Angeles in any respect but that of pure distance.

In the case of America, flourishing telephone systems abound along the whole of the route, whilst in Europe, east of Vienna or Budapest, the telephone is a comparative rarity, and in Western Asia almost non-existent. We hardly think the Kurd, the Arab, the Persian and the Afghan would look upon an overland route with a lenient or approving eye, nor, quite apart from any language difficulty, would even the civilised Mohammedans of the cities come flocking to load the line with traffic. It is the proud task of engineers to translate into reality to-morrow the scientific dreams of to-day, and if ever a circuit from London and Bagdad or Delhi became a reality it might confer the greatest possible benefits on the relations between the Mother Country and our Indian Empire, but it is difficult to foresee the telephonic development of States in the Middle East following the happy example of, say, Nebraska. To put it in another way the line east of Bucharest or Constantinople would be purely an *ad hoc* line to Bagdad and India, whilst we imagine that a route west of Omaha would carry lines from all sorts of places in America to all sorts of places on the Pacific coast.

Another important point which Mr. Gill did not lose sight of was the power for peace latent in the international telephone. To increase the facilities for a better understanding between nations would be not the least of the benefits which an improved inter-European trunk system would confer.

A NOTABLE JUBILEE.

As quite a junior among those periodicals that deal with matters electrical we offer sincerest congratulations to our contemporary, the *Electrical Review*, which on the fifteenth of last month completed 50 years of unbroken journalistic service to the electrical community.

The first issue appeared as a monthly under the title of the *Telegraphic Journal* which was indicative of the then existing conditions of the electrical industry, with telegraphy practically the pioneer. On Jan. 15 of the succeeding year the title of the journal was changed to the *Telegraphic Journal and Electrical Review* thus widening the scope and outlook. In 1882 it became absolutely necessary to issue the paper weekly so distinct was its success and so great was the pace at which the field of electrical science and manufacture had developed. In 1891 the first part of the title was dropped leaving the more comprehensive name of the *Electrical Review*, a change which was again obviously due to the marvellous strides taken, and let us add to the able editorship of the late Mr. T. E. Gatehouse.

The younger generation may not recall its single-handed defence of several actions brought against the proprietors for their criticisms of a much-advertised quack apparatus in the shape of an "electro-pathic" belt the vaunted wonders of which were depicted in hundreds of advertisements. The Medical Battery Company, such was the name of the advertisers, succumbed very soon after the results of the various actions in the Law Courts were declared as every decision was given against them. This was in 1893-94.

The *Electrical Review* still survives, a model of quiet, unostentatious, but confident scientific information.

HIC ET UBIQUE.

MR. GEO. MIDDLETON, editor of our contemporary, *The Post*, has been elected member of Parliament for the borough of Carlisle. We offer him our hearty congratulations. Mr. F. Macquisten, late member for the Springburn division of Glasgow, and a censorious critic of the Telephone Service was amongst those who failed to secure re-election.

ON the occasion of the recent visit of Mr. Lloyd George to Newcastle-on-Tyne, a very smart telegraphic performance was accomplished by the Newcastle staff in disposing of the verbatim report of 59 pages on the Newcastle-Edinburgh &c. CQ Wheatstone circuit in 87 minutes. That the transmitter had practically a non-stop run, that scarcely a correction was required, and that one at least of the receiving stations had the last page of the report in the newspaper office within five minutes of its receipt, all combine to produce a feat telegraphists may well be proud of. Such achievements are only attained by thorough organisation and close co-operation of all stations concerned.

BY the Federal Law of Oct. 14, 1922, new telephone rates are sanctioned for Switzerland. They range from 70 francs in places with 30 subscribers to 100 francs (£4) in places with 1,001-5,000 subscribers, and 110 francs (£4 8*s*.) in places with over 5,000 subscribers. In addition 1*d*. per call is charged. Suburban calls cost 2*d*., and trunk rates vary from 3*d*. to 10*d*. Triple rates are, however, charged for urgent trunk calls.

A HUMOROUS contemporary, the *Passing Show*, publishes an article beginning:

> A contemporary has raised the staggering question: "Do telephone operators become fatigued?"
>
> In order to obtain first-hand knowledge of this all-important problem our star reporter was instructed to obtain an interview with an exchange operator while on duty and the following is his report upon the matter:
>
> To the accompaniment of many muttering voices, the whirr of wool becoming jumper and the incessant click of countless knitting needles I made the acquaintance of Miss Sizz, champion operator at the Holborn Wall Exchange.
>
> Explaining the object of my visit, she willingly agreed to answer any questions I might put to her, provided, however, that I did not interrupt her knitting.

There is about a column of this stuff. The telephonist, of course, is used to, and can appreciate a joke against herself. But we think that a surprise visit by the author to a large telephone exchange would leave him wondering where the joke came in, and perhaps a little ashamed.

ACCORDING to the *Financial Times*, the Uruguayan Government has taken over the telephone system of the Monte Video Telephone Company, which received $700,000 for its privileges, plant, &c. On the other hand we hear that the Facisti Government in Italy is handing back the Government telephone system in the towns to private companies, and retaining only the trunk lines.

ON Aug. 18—21, an international telegraph competition was held at Berlin, in which 332 telegraphists from Germany, Sweden, Norway, Denmark, Esthonia, Russia, Holland, Italy, Jugo-Slavia,

Digitized by Google

Austria, Russia, Switzerland, Hungary and Czecho-Slovakia took part, Erna Bansewer, of Breslau, sending 2,888 words an hour on a Simens printer, won the speed championship. The second prize also went to a German woman. Of 72 prizes offered, German contestants captured more than a third.

The chief awards fell to competitors of the various nationalities as follows: To Italians for the Morse apparatus; to the German for the Hughes, the Siemens and for radio; to the Spanish for the Baudot, and to the Danish for the Wheatstone. Oskar Schindler, of Vienna, won the master-telegrapher trophy for being a prize winner on three different types of apparatus. The award consisted of a large silver cup offered by the President of Germany.

SOME REMARKS ON TECHNIQUE.*

BY SIR HENRY N. BUNBURY, K.C.B. (*Comptroller and Accountant-General*)

THE upheaval and stress of the war period has put many established institutions to the test. Not least among the institutions which are being submitted to the process are the procedure and methods of Departmental work in Government Departments. I think, therefore, that no apology is needed if on this occasion I select this subject, or rather certain aspects of this subject, for my remarks on this occasion. It has been, it is true, much talked about and written about during and since the war; and indeed it was a subject if not for public thought at any rate for public merriment long before the war. But I venture to think that it is not yet exhausted and that a newcomer into the field may still be able to make some contribution not without value to its study.

Technique is a somewhat elusive term; but on Humpty Dumpty's principle that "when I use a word it means what I choose it to mean, neither more nor less," technique will mean in these observations the method on the part of individuals by which a desired result is produced. In short, the technique of the individual officer is first cousin, as it were, to established methods of procedure in the Department.

It may be said that technique is all very well for technicians, but that it means nothing for ordinary plain people; that there is no such thing for them to acquire, and that if it were there for them to acquire, they would be just as well without it.

The answer to that observation is this. In any form of human activity whether, for instance, it be the designing of an automatic telephone exchange or the attempt to reach a right decision in a discipline case, or to satisfy oneself that an account is correct and the transactions therein duly authorised, the human mind aims at economy of effort. The mechanical engineer in designing a power unit, has as his primary object that of converting into applied energy the maximum possible percentage of the crude energy put into the machine. The position of the Departmental official is not fundamentally different. The object set before him, either alone or in conjunction with others, is that the right decision shall be given or the right conclusion arrived at with a minimum expenditure of human effort. And that is where technique comes in.

We have heard much for many years of "red tape"; and almost as much in more recent years of "business methods," and if we call "red tape" the technique of Government Departments, and if we call "business methods" the technique of business organisations, without any implication as to their respective merits and suitability, we shall have before us precisely the subject of these present observations.

I propose first to invite your attention briefly to a few of the governing conditions which determine the nature of any technique of Departmental work.

The first is that Departmental work is, speaking broadly, on a very much larger scale than the work of commercial organisations. It follows from this that the organisation of Departmental work is apt to be highly complex, and that the work of any individual acts upon and is acted upon by the work of numerous other individuals. It follows too, that the character of the organisation itself affects the work of the individual officer and the way in which he does it, to a considerable extent, and that the rightness or wrongness of the organisation is a matter of very great importance. But this is a little outside the scope of the present subject.

The next peculiar feature of Government work is this. Because it is carried out on a very large scale, and because the Department is ultimately, through the Minister, responsible to Parliament for its every act and omission, *records* become far more important than they are in private business. We have, or at any rate, we think we have, to record everything we do, and, in many cases the reason why we do it. It is not so much that putting things on paper assists the decision itself, although this is often a useful and sometimes a necessary means of communication between officials, and the presentation of a case in writing is of value to very busy people in coming to their decisions. But even if these considerations did not exist at all, it would still be necessary to conduct in writing much official business which in a private undertaking would be dealt with by discussion round the table or over the telephone. And these records have to be preserved.

The third peculiarity of Departmental work to which I wish to draw attention is that, in comparison, at any rate, with the smaller types of private business, the incentive of the official to do the best that is in him is not to the same extent a *pecuniary* incentive. As to the extent of this difference, there will no doubt be differences of opinion; all I want to do for the present purpose is to call attention to the fact that there is a difference, because, as will appear later, it has some bearing on this question of technique.

The last distinction to which I wish to draw attention is that Departmental work is, in the main, not concerned with the making, directly or indirectly, of money. Indeed, if we may believe what wiser people than we tell us, we are concerned solely with wasting it. But however that may be, the fact remains that to most Departmental officials the function of money making is entirely absent from their official duties. Very few Departments could produce a profit and loss account, not because, as is popularly supposed, they do not know how, but because the services, if any, which they render, do not consist in the earning and receipt of money, nor can they readily be expressed in terms of pounds, shillings and pence.

The Post Office is, to some extent, an exception to this statement. I am not going to suggest that the primary object of the Post Office is to make money by its services, in the sense in which a manufacturing or trading undertaking aims at making money, or even in the sense in which a privately-owned public utility, such as a railway company or a gas company, aims at making money. But the fact remains that public opinion requires the Post Office, in conducting its services, not to lose money, and that that position is accepted by the Post Office Administration. Considerations of profit and loss therefore enter into all Post Office activities, and the Post Office, unlike other Departments, does publish each year its profit and loss account.

I have probably said enough to indicate in a general way the sort of conditions in which the technique of departmental work has to be applied. Let us now come to the subject of that technique itself.

We have set before us, as our guiding objective, the attainment of the right result with the maximum economy of effort. How are we to set about it?

In the first place, by simplicity and directness of method. "If you are simple you are right; if you are complicated you are wrong," as I remember hearing a former Secretary of the Treasury once say. If is a well-known mark of a good accountant that his accounts and his book-keeping systems are usually simpler than those of the less competent. He has the quality of perceiving and concentrating on the relevant, and of ignoring the irrelevant. Simplicity is, of course, a relative term; you do not attain simplicity, but merely imperfection, if in designing a house you leave no room for the staircase, or if in sending an overcharged telephone subscriber an amended acount, you omit to say that you regret (or at any rate the Postmaster-General regrets) the mistake.

But the directness with which any piece of work is approached; the simplicity with which it is handled; the absence of irrelevant work, of unnecessary checks, of unnecessary references, of unnecessary arguments, of unnecessary details and trimmings—these are surely all marks of a good technique which the competent judge will at once recognise. Don't write reports on references when the telephone will serve for all purposes; don't if you can help it, conduct controversies on paper, and avoid triangular or quarangular discussions on paper; keep before you the object of the activity in which you with others are engaged, viz., the ascertainment of the actual facts, the giving of the right and not the wrong decision, the production of the most efficient instrument or service or arrangement; the proof as to accuracy or authority of the accounts you are handling. When the end is clearly seen and realised, then, and perhaps only then, is the best, the most direct, the simplest line of approach apparent.

The next element in a good technique is to pay due regard to time. A machine, whether it is a departmental machine or any other sort of machine, which works too slowly—which is apt to be too late—is, whatever its merits, not an ideal machine. And if the actions and decisions and productions of a Department are to mature—to become available, as it were, at the right time, it is necessary that the time-sense, as I may call it, shall be exercised not merely by the heads, but by all concerned. There is nothing more pathetic than to see, as one has from time to time seen, a good and sound decision reached at a time when it is too late, if not to apply it at all, at any rate to derive the full benefit from it. I have often thought that it would be of great assistance to those who deal with cases on official papers if the papers could be conspicuously flagged, "decision (or reply) advisable by . . . "; it would stimulate and develop our time-sense. And we should each perceive, not merely how long we ourselves could afford to keep the matter in our hands, but within what limit of time the machine as a whole had to perform its function, and hence in what way—possibly some special way—it would have to be handled in order that the right action might be taken at the right time.

A third element in a good technique (and it follows naturally on that just described) is what I will call the team sense.

* The Chairman's address at the opening meeting of the Post Office Telephone and Telegraph Society of London on Oct. 23, 1922.

Digitized by Google

Earlier in this paper I spoke of the Department as a machine. The term is often used, but, useful as it is, the analogy it implies contains a fallacy. No combination of human beings working together to a common end, can be merely a machine; on the contrary they are essentially an *organism*; they are a company of players, not a group of puppets. And what is an important part of a good technique is that this fact should be present to the minds of Departmental workers. It makes a difference—sometimes a very considerable difference—to A's work if he is aware how it affects the work of B. C. and D.; if, in fact, he realises the part which he plays, and others play, in the common effort upon which they are engaged. It is the best corrective to what is supposed to be a somewhat typical defect in public officials—pedantry. We *are* a little apt to be pedantic, though I think that this criticism is far less warranted than it would have been a generation ago, or even before the war, But the pedantic mind always works in isolation and the team habit and the team spirit kill it.

Similarly, a man who is conscious that he is one of a team and of his place in the team in relation to the places of the other members, is free from the temptation, which may otherwise beset him, of unnecessary exactness, unnecessary elaboration, or an unnecessary degree of criticism, in his work. These defects, where they exist, are due, I think, mainly to over-conscientiousness; but they can only live in the mind which in the official sense, exaggerates the importance of its own job; when we realise exactly the relation of our particular bit of the job to the other bits with which it is connected, we find it easier to confine ourselves to the essential and to omit the trimmings, which is an important part of a good departmental technique.

One is tempted at first to give a special place in considering technique to the money sense; and yet it is doubtful whether it can claim a place at all. Economy and efficiency, though they are often used, especially in official utterances, as different, and even as incompatible things, are surely, in fact, different aspects of the same thing. You can't have the former without the latter, and I doubt if you can have the latter without the former. If then in the way in which we do our official work all the elements which constitute efficiency are present, we shall surely find our work economical also. But it is an advantage—especially in those types of work which are not directly concerned with money—to realise not only that we all are spending money, but how much money we are spending and what return it is bringing or going to bring in. This latter in many kinds of Departmental work is a difficult, frequently an impossible, task for the reasons I have already indicated. But it is a useful thing to know at any rate the cost to the State of one's own work per hour or per minute, and still more useful, because less obvious, to consider upon occasion the cost of the work we cause other people to do. I would commend this idea especially to officers in Departments of Control. It is important, because none of us earn individual profits and many of us do not earn profits at all, against which the cost of our work can be set.

There are other elements in a good Departmental technique, which I do not propose to mention, because they will be apparent to all and we can take them for granted; they are the A.B.C. of our official education. One other element, however, demands a word or two, and failing a better term, I will call it the human element. We all, in a greater or less degree, deal with human beings, whether the outside public or, if I may, include them in the same category, our own colleagues. Now when you address yourself to a human being, whether on paper or by word of mouth, it is well to consider how he is going to take it. If I were delivering these observations to the general public, I should have to tell then—or try to tell them—the proper way to address a counter clerk; as I am speaking to an audience of Post Office servants, it would be more appropriate (though perhaps less wise) to say how a counter clerk should address the general public. This, however, I do not propose to do. But it is a little important to acquire the habit of considering the psychology of the person to whom we are addressing our remarks, verbal or written—and indeed to consider whether verbal or written speech is the best means of getting what we want or conveying the information or instructions which it is our duty to convey. The business man, especially of the more enterprising sort, is very much alive to the importance of this, and indeed, I fancy that in the United States they write books and hold conventions about it and very likely confer University degrees in the art. We officials have not given the same self-conscious attention to the art of saying the right thing in the right way, but I think it is a not unimportant part of a good Departmental technique.

I now propose to deal, very briefly, with the application of these principles to certain classes of Departmental work not so much constructively as by way of illustration. And I will take, as typical, three classes of work:—

Dealing with papers and correspondence.

Examining and auditing accounts.

Technical and semi-technical work.

The application of the principles I have just expounded to the work of dealing with papers and conducting official correspondence will be apparent and needs little elaboration. Directness and simplicity of thought and expression, regard to time, and to the part which others have to play in the subject under consideration, are all well known and well recognised elements in good administrative technique. What perhaps does not always receive the attention it deserves is the money aspect—the cost of dealing with any particular piece of administrative work in relation to the return to be obtained from it, and in relation to alternative ways of attaining the same result. It would be an interesting experiment to have official files weighed and to work out the cost of the results achieved by each file in terms of so much per ounce of official papers. I suspect that the cost to the Department of any one pound of official file does not vary very greatly from the cost of any other pound. May I commend this idea to those who are interested in official statistics; they may find it worth exploring.

There is, however, one aspect of the application of the team principle to administrative work which deserves special mention. It is connected with the thorny subject of delegation. We are constantly being urged, and urging others, to delegate. A right use of delegation is regarded, I think justly, as the secret of success in handling any large organisation, that is to say, in directing the work of a considerable number of other people. But it is often urged against some particular extension of the principle of delegation that if A. leaves it to B. C. and D. to dispose of the cases, he will not know what is going on nor can he be sure that B., C. and D. will proceed on the same lines. Now this is where the team principle comes in. There is an obvious loss of efficiency if 100 cases have to be submitted or referred to A. in order to secure him against the risk of a mistake being made in one of them. The insurance premium which the Department pays for this security is much too high. It is the duty of B., C. and D. to take care among themselves that they are proceeding on uniform lines and to keep A. informed from time to time of the lines on which they are proceeding. This is the way to make delegation successful, and I cannot summarise it better than in the words of an authority on American Rail-road Administration. He says, "the office (of Director of Maintenance and Operation) is administered on the theory of a minimum of direct action made possible by a maximum of information, he assisting each one of the units below from the bounteous lessons of experience furnished by all." There is the minimum of direct action from the top downwards, and the maximum of information from below upwards.

I come now to the examining and auditing of accounts; here again the importance of simplicity and directness of method and regard for time and cost are apparent. Unfortunately, the differences between the conditions of Departmental work and those of private business are specially marked in this class of work. The professional accountant has his road—it may be a difficult one—clearly marked out for him; he has to do so much work as will enable him to give the required certificate and not so much as will make the job unremunerative to him. If he gives an unwarranted certificate he may be held liable in heavy damages; if he puts in more work than he can afford he may find his fee absorbed in clerks' salaries and expenses. Not so the Civil Servant, who though subject to limitations of one sort or another is not in the same close contact with profit and loss. It is therefore the more important that those who are engaged in examining and auditing accounts should aim at the best possible method or technique. In particular, the team sense is important. No good auditor will tolerate badly-rendered accounts over and over again. His object is that they shall be so rendered as to give him as little to do as possible, and he will "go out of his way" as it is called (really it is very much in his way) to show the officer who renders the accounts how he ought to do it. The idea, sometimes met with, that the best auditor is the man who produces the most queries is a dangerous half-truth; in many cases the best auditor is the man who in the long run, produces no queries at all.

Some study of human nature, again, is valuable to the auditor. He must, for instance, remember that the feeling of the average auditee, in dealing with the auditor, is much the same as that of the average and otherwise innocent man when he stands at the counter of his bank face to face with the cashier. And, on the other hand, something in the method or manner of the auditee may put the auditor, if he is quick to perceive and interpret it, on the track of cleverly concealed fraud. However, the human element in auditing is a subject worth a paper to itself, and I must not pursue it further now. I would only add—and the connexion of thought is closer than at first appears—that in auditing for fraud, which after all is but a small part of our examination of accounts, it is the unexpected, the unusual, method of check that pays, when circumstances allow you to do it.

Lastly, the officer engaged in technical or semi-technical work. Now of him I am thoroughly frightened: and I am not going to put myself in the position of offering to teach him how to do his work. But I would just say this, that these marks of a good technique which I have been describing are, most of them, borrowed more or less from the methods and practice of technical workers. Simplicity and directness is the hall-mark of good design. For team work you have only to go, for instance, to the groups of medical and scientific men engaged in medical research. And so on. All I need say then to the technician is to commend to him, with all the earnestness at my command, the cultivation of the money sense, and to suggest that those same qualities which are recognised as valuable in his technical work proper are equally valuable, with perhaps some slight adaptation, in that part of his work which brings him, as a departmental officer, into contact with non-technical colleagues.

In concluding these observations, I must claim the indulgence of the Society if they appear to consist in the main of somewhat vague generalities. And I am well aware that in so far as they presume to advise, that advice is needed as much by the author as by his audience. But in accepting the invitation to address your society, I felt that the only path of safety for the non-technical men among the technicians was to be as non-technical as possible in the hope that, if I did not claim to be one of yourselves, you would be moved to pity rather than to wrath; and perhaps I had the further hope that these remarks, if they contain little of positive value, may provoke and stimulate thought upon subjects which I believe to be of very considerable importance to us all.

G.P.O. ARTS CLUB.

THE tenth Exhibition of the above club held Nov. 3-18 at Mount Pleasant maintained the high standard which has been set in the past. Nearly 500 exhibits were on view ranging from paintings, pastels and etchings to black and white drawings and photographs. Mr. C. S. Sanderson, Controller, L.P.S., opened the exhibition with a sympathetic speech, and Mrs. Sanderson presented the medals to the successful competitors.

Amongst the pictures which particularly attracted our notice were "Market Square, Midhurst" (A. T. Blythe), "Shower, Moorside, Baildon" (H. P. Staub), portrait of Mrs. Patterson (H. L. Bacon, bronze medal), and the very spirited horsemen in F. C. Osborne's "Hunter's Morn." Miss E. K. Lucas' studies of girls (bronze medal) were very charming; and the etchings of Mr. J. A. Swatkins, especially "The Ford" (bronze medal) and "The Corner Shop, Polruan," were the outstanding feature of their class. Mr. E. A. Lee's "Liza" was also excellent in its broad style. Other works awarded medals "Less than the Dust" (silver), Elsie M. Beagley; "The Field Barn" (silver), H. F. Edmunds; "The Barbican Gate, Lewes" etching (silver), A. E. Homewood; "Design for Club Poster" (bronze), T. P. Clark; "River Arun, Amberley" (bronze), W. A. Moody; "Summer Noonday" (bronze), S. H. Hancock; and "Coming in on the Ebb Tide" (bronze), T. P. Clark.

We should like to have seen some medals go to that fresh and admirable colorist, Mr. Frank Farmer, whose "Sky Study" and "Chateau Gaillard" were especially clever. We were glad to see an exhibit by Mr. Thos. Wilson, one of the original moving spirits of the club, a characteristic "Essex Common." Mr. A. G. Ferard contributed three paintings, of which we liked best "The Greek Theatre, Taormina." We regret that we have not the space to deal more fully and appreciatively with the many excellent exhibits. We can only mention the medallists in the Photographic section, viz., Mr. Upton Cooke (Thames at Twickenham), silver; Mr. E. A. Ife (An Angry Mantle), bronze; Mr. D. G. Luckings ("Gordon"), bronze; Mr. A. J. Freeman (November Morning, Tower Bridge), silver.

An innovation this year was an Invitation Section open to members of other Departments of the Civil Service. Considerable support was received and some fine work contributed, including "Beating out of the Creek" (silver medal), by Robt. H. Smith, of the Admiralty; "Portrait of Mrs. D. Patterson," already referred to, by H. L. Bacon of the Admiralty; and "A Scotch Hayfield," by F. Aumonier of the Customs. The medal in the class for pictorial photographs was awarded to Mr. R. E. Holmes of the Customs. We hope that the success achieved this year will lead to the Invitation Section becoming a permanent feature of future Exhibitions.

Incidentally, we understand that the Committee feel that there must be a considerable amount of talent in the various telephone exchanges which they would like to see more fully represented next time.

REVIEW.

"The Post Annual." Edited and published by Geo. Middleton, 43, Cromwell Road, S.W.7. 80 pp. 1s.

The second issue of this annual is fully equal in quality to the first, which is no easy achievement. It contains stories by Stephen Kendall, Austin Phillips, and John Doye, the prize winner of the *Post Annual* Literary Competition, humorous drawings by Will Owen, Arthur Watts, Rene Bull, and "Stock" Walsh, an article on "The Theory of Humour," by Thos. Jay of *Punch*, and descriptive articles on the Postmaster-General's Working Day, Art in the Post Office, a Telegraph Messengers' Holiday Camp, the Postal Museum in Berlin, Post Office Sport, and (without which no periodical publication would now be complete) something about Wireless Telegraphy. Both on subjects, grave and gay, the *Annual* offers an excellent shillingsworth and we can heartily recommend it to all our readers.

INTERNATIONAL TELEPHONY IN EUROPE.

CONDITIONS OF EFFICIENT DEVELOPMENT.

MOST of Mr. Frank Gill's inaugural address as president of the Institution of Electrical Engineers was devoted to the problem of international telephony in Europe.

He showed that the result of loading the circuit is reduced attenuation and somewhat impaired articulation in open wire circuits, and reduced attenuation and better articulation in cable circuits. The use of repeaters enables additional energy to be put into the line as required, and the attenuation can be reduced by that means. It is, therefore, no longer necessary to sacrifice the quality which can be obtained on open wire circuits by loading them in order to reduce the attenuation, for this reduction can be effected by repeaters. In cable circuits, however, loading is necessary to reduce the frequency distortion. Consequently, long, heavy, open wire lines are not now loaded at all, but are repeatered, resulting in improved articulation, while the increased speed of propagation avoids echo trouble, which became insistent only because of the more powerful effects derived from repeaters. With cable circuits, on the other hand, loading still obtains. It cannot be abandoned, since it is necessary for the reduction of frequency distortion, but the tendency is towards lighter loading so as to raise the speed of the circuit, thus reducing the echo trouble, which, because of the reduced speed and the great electrical length of loaded cable circuits, demands most careful consideration.

Carrier Circuits.

In the search after increased capacity of telephone and telegraph circuits there has recently been developed and put into commercial service the carrier system, which has been added to the well-known methods of superimposing phantom telephone and compositing telegraph circuits. In this new method carrier waves of different frequencies for each channel of communication are generated. If the channels are to be used for telephony such waves have a frequency above the audible limit. By means of band filters the desired range of frequency is permitted to pass into each channel, but only frequencies within that range; thus on a four-channel telephone carrier circuit the frequencies might range in four or eight separate bands with outside limits of 4,000 to 27,000 cycles per second. Each carrier wave is modulated independently by the voice currents to be transmitted by that channel, and all the modulated carrier waves, or all of one of the side bands only, without the carrier waves, are transmitted over the line. Upon reaching the far end the waves are filtered out, each into its proper channel according to the carrier frequency assigned to each channel, and are then demodulated, leaving the voice current free to be farther transmitted over an ordinary circuit. Because of the increased frequency of the carrier waves, greater attenuation occurs with them than with the voice waves, and carrier current repeaters must be equipped more frequently than voice current repeaters; also, for the same reason, carrier currents cannot be transmitted over ordinary loaded lines, which it will be remembered cut off at frequencies within the audible range. Hence, if loaded carrier circuits are required, they must be specially treated. Special treatment is also needed in the construction and maintenance of carrier lines and equipment, and because the equipment is expensive such lines must be of considerable length in order to be economical.

The advantages to be gained from using this latest development are exemplified on the New York-San Francisco line. Between Harrisburg and San Francisco, about 2,500 miles, the circuits are of open wire, and the loads carried on four conductors, are two physical telephone circuits, one phantom telephone circuit, four earthed telegraph circuits, and a number of carrier telegraph circuits ranging from six to twenty. Between Chicago and Omaha (450 miles) four open-wire conductors carry two physical and one phantom telephone circuits, four earthed telegraph circuits which can be worked either one-way or two-way at will, and twenty two-way carrier telegraph circuits, or a total of twenty-seven circuits, while between Chicago and Pittsburgh (450 miles) eight open-wire conductors carry a total of fifty-one circuits. From Chicago to Omaha or Chicago to Pittsburg the direct distances are about the same as from Paris to Berlin, Paris to Marseilles, or London to Milan.

Deficiencies in Present System.

A long-distance telephone line used to be a relatively simple structure, consisting merely of a pair of copper wires, either open or in cable, which could be maintained in good order with comparative ease by independent maintenance units situated along the length of the line. But with repeaters and loading that simple structure has vanished, the plant is more complicated, the various parts are inter-dependent, and it is no longer possible to consider maintenance of each part solely as a sectional matter. In Europe, taken as a whole, there are about forty self-contained local operating organisations, most of which conduct a local business and a through business within their areas, together with that part of the international through business which lies within their own borders. But there is no organisation controlling or co-ordinating the various local operating organisations, which yet have to function as a whole; no means of keeping the separate organisations in touch with each other, and no systematic means of adjusting differences in matters of daily practice; no organisation to handle and look after the through business as a whole; no common agreement as to manufacture;

Digitized by Google

no common research, standard practice or technique of construction, maintenance, and operation. Under such conditions through-telephoning in Europe can never be worthy of the name of a service.

There is, however, no engineering difficulty, so far as distance is concerned, in constructing and operating lines at commercial rates to give satisfactory speech between every part of Europe, and there is every indication that, given facilities, there is traffic waiting to be handled between the cities of Europe as between the cities of the United States. New York originates over four million long-distance calls per annum, Chicago and Philadelphia a number approaching two million each, and Boston, Cleveland, and Pittsburg about half a million each. The direct distance between Brussels and Athens, or between Paris and Constantinople, is 1,300 miles—about the same as between New York and Omaha or Chicago and Salt Lake City, between which cities calls can be made at any time. The direct distance overland between London and Bagdad is about the same as between New York and San Francisco, over which line conversations take place daily, while the direct distance between London and Delhi is about the same as from Key West to New York and thence to San Francisco and to Los Angeles, over which distance calls can be made regularly. As a further encouragement, the New York-Chicago cable now in course of construction will have a gross transmission equivalent so great that if a 435 lb. (4.2 mm.) open-wire circuit were constructed to that equivalent it might be 10,000 miles long, enough to connect Paris with the telephone system of Seattle in the north-west of the United States and leave sufficient to take care of the cable across the Behring Straits. This illustration, though uncommercial, is sufficient to show that land distance is now no difficulty to telephony.

Unity of Control.

The through business must be handled as a complete unit if it is to be done efficiently; it cannot be done by independent units. The correct course is, then, obviously to depute a body to do for all the European nations what no one nation can do for itself. This is no new departure; it is already practised by banks and railways in their clearing houses. It is not enough for the separate organisations to attempt to agree to a code of rules subscribed to by each. The business is varying, flexible, and very much a living thing; it demands intelligent and prompt treatment of its many variations, and it requires control from central points with power to instruct persons at a great distance in the routines and duties they are to perform. Such control can be effected only by a living authority always on duty.

One possible method would be to operate all through business, both within and between the various countries in Europe, by a single long-lines company working under licences from the various Governments, taking the calls from the various local originating organisation, and being entirely responsible for them until turned over to the local receiving organisations. Another method would be for the various Governments to form what in effect would be a private company or commission, of which the Governments would be the stockholders and which in each country would derive its authority from the subscribing Governments. A third method, frankly of a temporising nature, would be for the various telephone operating authorities to form themselves into an association for the study of the problem. The president offered the definite suggestion that the telephone authorities of Europe, including the United Kingdom, should—as telephone-operating authorities rather than as Government Departments—hold an early conference of all the telephone authorities, companies, and municipalities, as well as Government Departments, to study the problem in detail and endeavour to find a solution.—(*Times Engineering Supplement.*)

LONDON ENGINEERING DISTRICT NOTES.

Institution of Electrical Engineers.

MR. F. GILL'S PRESIDENTIAL ADDRESS.

THERE was a great gathering of telephone men to hear Mr. F. Gill give his Presidential address at the Institution of Electrical Engineers on Nov. 2.

No announcement of the subject of the address was made beforehand, but all who know Mr. Gill anticipated rightly that he would have something interesting to talk about. The early part of the address dealt with some matters of importance to the profession as a whole: the remainder of importance to humanity at large and to Telephone Engineers in particular. Mr. Gill never handles anything that he does not put all his whole heart and soul into. As President of the Institution of Electrical Engineers he seized the opportunity of reminding members that they had their duties as well as the Council, and that it is only when the whole membership recognises this fact that the best interests of the profession can be served.

Mr. Gill dwelt on the importance of the proper training of Junior Engineers and stressed the importance of a proper appreciation of engineering economics. His remarks under this head touched a responsive chord in the hearts of Post Office Engineers, all of whose official actions are governed by the laws of economics. The responsibilities of commercial firms in assisting in the training of young engineers was the next point made. By arranging to accommodate apprentices and by assisting them to gain practical experience they would help to build up the supply of technical men from which to draw their own ranks in the future.

In the second part of his address Mr. Gill reviewed the advances in the art that had made it possible to conduct telephone conversations over great distances, such as New York to San Francisco, some 2,800 miles. He explained the difficulties that at present prevent similar results being obtained in Europe. There is no physical reason why London should not speak to Bagdad, a distance equivalent to that referred to above. To build such a line and to maintain it, unified control would be essential, and Mr. Gill gave his views as to how this desirable end could be attained.

The address was concluded by the suggestion that the surest way to ensure peace in Europe would be to remove misunderstanding between the various nations concerned, and the easiest way to do this would be to provide the maximum facilities for free intercourse with the aid of the telephone. The Great War was sometimes called an Engineering War; may the future Peace of the World be called an Engineers' Peace.

It is pleasing to note that during the same Session that Mr. Frank Gill is President of the Institution of Electrical Engineers, another telephone engineer has been appointed Chairman of the North-East Centre of the Institution. Congratulations to Mr. Baldwin on his selection, and congratulations to the Institution for their wisdom in choosing such an able engineer to preside at their meetings.

Mr. Baldwin, who is at present Assistant Superintending Engineer of the Northern District, with headquarters at Newcastle-on-Tyne, was in 1911 on the London staff and remained in the Metropolis for some time after the transfer. There is not a keener or sounder telephone engineer in the Kingdom. As was announced previously in these Notes he is devoting his spare time to the compilation of "A History of the Telephone in the United Kingdom." His many friends in the London District read his inaugural address to the North-East Centre with special interest.

Transfer.

The London Engineering District has experienced a great loss in the transfer to the Engineer-in-Chief's Office of Mr. G. F. Greenham, Assistant Superintending Engineer. Mr. Greenham has a unique knowledge of the telephone exchanges of London. He was the Metropolitan Electrician in the days of the National Telephone Company, and as such was responsible for the construction of new exchanges and the maintenance of existing exchanges. After the transfer he was made responsible for the internal construction work of the London Engineering District, and everyone who has been connected with Mr. Greenham on this work will know how extensive was his knowledge and how freely this knowledge was placed at the disposal of every earnest seeker. The transfer is not all loss to the District as Mr. Greenham will be dealing with telephone exchanges in his new sphere and will therefore be dealing with London matters as well as provincial exchanges. The staff with whom he has worked so long wish him every success in his new sphere.

Mr. Greenham's place will be taken by Mr. Thow, Assistant Superintending Engineer, from the South Midland District. Mr. Thow is an old friend having previously been stationed in the London Engineering District. A hearty welcome is extended to him.

Automatic Exchanges.

The L.C.C. have placed an order for an automatic exchange to be installed at the New County Hall. The equipment will be supplied and fitted by the Automatic Telephone Manufacturing Company and will consist of 600 preselector switches, also a manual equipment consisting of seven subscribers' sections. The work is due to commence early next January and will take approximately three months to complete.

Messrs. Pocock Brothers, 233, Southwark Bridge Road, also have placed an order for an automatic P.B.X. The initial equipment is as follows:—

Extensions, automatic	30
„ manual	3
Exchange lines	5

1 Manual "A" position.

The work will be carried out by the Relay Automatic Company.

Eltham New Exchange.

It is expected that the new C.B. No. 10 Exchange situated in Well Hall Road, Eltham, will be ready for service next year. This exchange will cater for the district midway between Lee Green and Woolwich. The initial equipment will be for 880 subscribers' lines and two junction sections. The work of installing will be carried our by the Department's Engineers, a portion of the apparatus to be supplied by Messrs. Siemens Brothers.

Passing it on.

One of the speakers who took part in the discussion on Sir Henry Bunbury's address at the Telephone and Telegraph Society's Meeting on Oct. 23, asked whether any steps were being taken to put into practice the suggestions that are made and ideas that are outlined during the reading of papers and the subsequent discussions. This particular Society was formed

Digitized by Google

some years before the Transfer with the object of engendering in the staff an interest in all branches of the late National Telephone Company's activities, and by the reading of papers and by debates to widen the outlook of every member of the staff. With this end in view papers were sought from all grades of the staff, and officers in the humblest positions were encouraged to express their views on the subjects before the meetings. It was not an uncommon occurrence in those days for workmen to take part in the discussions, and the views of the manipulative staff undoubtedly helped the administrative staff in the conduct of their duties.

After the transfer it became apparent to those interested in the Society that in an organisation such as that of the Post Office with its more or less water-tight compartments, the Society, if properly supported, would have an even greater field of usefulness than under the old *regime*. Consequently its doors were thrown open to all Departments of the Post Office, whose work is directly or indirectly connected with the telephone and telegraph business. The response was highly gratifying and the Society has flourished like a green bay tree. The Committee has succeeded in getting together, year after year, excellent series of papers and the heads of several Departments have in turn held office. The membership still includes all grades of the staff. There can be no question whatever that the aims of the organisers of the Society have been attained. Members are, through the medium of the meetings gaining an ever-increasing knowledge of the activities in other Departments, and the efficient conduct of the Post Office work as a whole has no doubt been assisted.

Presumably all who attend the meetings do so with the desire to learn, and having learnt something to make use of the knowledge on the first opportunity. The views expressed and applauded sink into the sub-conscious minds of those present and influence their actions on some future occasion. Say, for example that the Engineer-in-Chief is present and is struck by some remark, probably some future instruction or action of his, will be influenced by that remark, and in this way good is done even though it may not be immediately apparent to the audience in general. Some humble officer may have been present, say, at Sir Henry Bunbury's address, and had impressed upon his mind that the successful man is he who finds out something about the other fellow's job, and went away with the intention of getting out of his head the idea that his own activities—without regard to their influence on the work as a whole—is all that matters to him. Here again something has been gained.

Advice Notes.

It may interest some in other Departments to know how the particulars of subscribers' telephonic requirements are conveyed to the Engineering Department.

After the preliminary negotiations between a would-be subscriber and the Controller, L.T.S., have been completed, the particulars of the type of installation to be provided are notified to the Engineering Department on a form known as an Advice Note.

Until the middle of June of the present year it was the practice for the particulars to be copied in the Engineering Department on to a number of works forms.

There are many officers concerned with the provision of a telephone line and each must have his instructions and means of recording particulars of time spent on the work, plant installed, &c. The late National Telephone Company's system was to type several copies of the Advice Note and to circulate one copy to each branch concerned—the distinction of each copy was determined by its colour. The advisability of re-introducing such a system and thereby saving the cost of typing works copies as a second operation was considered in the early part of the present year. The requirements were rather more difficult to meet than under the Company's organisation, but a satisfactory scheme was evolved and has been working smoothly since it was put into operation.

In the case of a new line 6 copies are typed at one operation, a white copy remains in the Advice Note Book. A blue copy which may be considered to be the master copy is forwarded to the Fitting Office, and is eventually returned to the Controller bearing information that he requires to have from the Engineering Department. A pink copy is sent to the Exchange Traffic Staff and by them to the Test Clerk after having been endorsed with details of telephone number and the position that the line is to occupy on the switchboard. A buff copy goes to the Test Clerk and is sent by him to the Fitting Office after he has proved the circuit with the external foreman. A yellow copy and a white copy go to the External Engineer, the former for office purposes and the latter for the workmen.

With some classes of service fewer copies are needed—for example—in the case of internal extensions the External Engineer has not usually to do any work, and therefore does not require the white and yellow copies.

The entries on the various copies provide amongst other things for the upkeep of apparatus records in the Test Room, the records of external plant provided or spares used, time spent by the workmen, &c., and the printed entries are designed to ensure that no step or information is overlooked. As an example a fitter requires to know what type of protector to fit, he looks at his copy and sees whether the external workman has provided the circuit by an overhead or underground wire and if by overhead whether the line crosses the power wires or not.

The system meets the very onerous conditions obtaining in the London District and caters in the simplest possible manner for all the complications that are to be met with in such a congested and complex area.

Pneumatic Street Tubes.

It is possible that few readers of this JOURNAL have but the barest idea of how faults in the pneumatic street tubes are localised and cleared. Miles of these tubes, which are of lead and protected in iron pipes, run beneath the streets from the Central Telegraph Office to the larger post offices and cable companies' offices in the City and West End. Many of the tubes are veterans of the very early days of the C.T.O., and despite their years are giving excellent service.

It will be readily understood that the very heavy vehicular traffic these days is a severe test of the construction of the tubes and occasionally the weaker places give way under the strain. The result is an obstructive dent in our tube, or more frequently a fracture and leak is caused at a joint in the older tubes.

In either event a complete stoppage may occur and carriers containing telegrams be held up in the tube. Such defects of course may be the result of damage through the operations of excavators working in the roadway, but in such cases the exact locality of the fault would be easily ascertained and the fault removed by exposing the tube at that point.

Generally, however, it is very desirable to locate the position of the trouble in the most direct manner and by disturbing the minimum amount of usually expensive paving. In the past it was the practice to locate such faults by taking pressure and vacuum time tests to and from the testing point and then sub-locating the obstruction by means of sweep's rods. This entailed a series of street openings and absorbed much valuable time.

Now, however, by a rapid but careful consideration of each fault as it arises it is often possible to determine directly by test the precise position of the fault and thus minimise the number of openings.

To facilitate localisation and to reduce the length of the sections between test points, inspection troughs are being introduced on all new tubes.

When carriers are imprisoned by an obstruction in the tube, it is sometimes possible to release them by suddenly applying vacuum if the tube normally works on pressure or *vice versa* if worked on vacuum. If the tube is clear of carriers then the exact position of the defect can often be found by allowing a carrier to which is attached a light line paid out from a hand-winch to be blown or sucked up the tube. By means of the line passing through his fingers the experienced man can feel every bend and dent in the tube as the receding carrier passes over them. The exact length of the line to the fault is then known and by measuring off on the scaled route plans the roadway can be opened with the assurance that the obstruction is below within a few feet. In this manner as much as 750 yards of line has been paid out and the fault located.

A similar method is employed in locating bad air leaks, but it will be appreciated that though long straight sections of tube may be dealt with in this manner, where there are several bends in the route the sensitiveness of the "fishing" line to the movement of the captive carrier is much reduced.

There are other methods of locating leaks employed in the C.T.O. Section. One is the use of a metal cylinder shaped like a carrier encased in soft rubber. Connected to this is a long length of light rubber tubing. This "stopper," as it is known, is drawn into the faulty tube under vacuum and the rubber tubing paid in after it. When in a sufficient distance the stopper is expanded by forcing air through the rubber tubing this effectually sealing the tube against the passage of air. The section under consideration is then pressure-tested by means of an air pressure gauge connected to the tube, and a noticeable falling off of the reading when the pressure supply is off tells us that our leak is in that section.

REVIEW.

"Wireless: Popular and Concise." By Lt.-Col. C. G. Chetwode Crawley, R.M.A., M.I.E.E., Deputy-Inspector of Wireless Telegraphy, General Post Office. Messrs. Hutchinson & Co. 1*s.* 6*d.*

A clear and careful survey of the present position and future possibilities of wireless telegraphy and telephony, without bias and free from mystifications, this book should command a ready sale amongst those who desire a general knowledge of the subject, but do not wish to be troubled with the multitudinous technicalities which so readily grow up around a new science. As an author of a popular treatise Col. Crawley is careful to confine his readers to the effects produced where the causes are at present unknown or largely a matter of surmise. We have no hesitation in recommending the work to our readers as one of the best popular books at present on the market.

No doubt the Grimsby Station, which according to the map on page 60 has been driven by storm to the Firth of Forth, will return to its proper haven on the Humber in time for the next edition. Possibly its exposed position led to its present detachment.

"TALK OF MANY THINGS."

"The Lying Loadline."

LOAD Line Records! Not a very romantic subject, you will say; but this article in no wise smacks unduly of officialdom. Perhaps it will shed a new light on the true usefulness of records. Every telephonist is only too familiar with the rule which appears periodically in the rule book, announcing the fact that a Loadline Record will take place on such and such a day and that telephonists will record in the usual manner. Each girl, as she signs the rule, indulges in a shrug and a sigh and a thought of pity for misguided officials who labour under the delusion that any reliable facts concerning traffic can be really obtained by such a means. Under the heading "What Every Supervisor knows" could be written the history of the sad fallacy of the Loadline.

For weeks we poor telephonists work breathlessly, unceasingly, handicapped by short staff. Slogging—there is no other word to describe it. The horrid little winking opals glow on the switchboards like the evil eyes of a malicious hydra-headed monster. No sooner is one extinguished than a dozen others glow into being in malignant derision. Of course the Powers-that-Be realise that such things cannot be permitted to endure. The fair and fragile maidens in their employ must not work at such a tension. Accordingly they cast around for means whereby they shall decide how much work is to be accomplished and how many telephonists shall be employed on it. Instead of taking the testimony of supervising officers—those officers who have been trying to make ten girls go into seventeen positions—those officers who *have* to "get girls out" for lunch and tea—those poor officers who have continually to rob Peter to pay Paul. Instead of listening to the results of bitter experience, a Loadline Record is ordained to take place on a certain day.

Holidays, motor shows, general elections, racing, and seasons may follow each other in quick succession each adding its quota to the task of the already overburdened telephonist. On the day of the Loadline Record, everything stops as if by magic. It seems as if all the world knows that *our* exchange is taking a record, and conspires to refrain from using numbers thereon. Racing ceases, shows come to an end, people go out of town, and offices close down. The result of the Record is that there are twenty girls proved to be too many and fifteen positions must be closed down. In due course this takes place and by the time the staff is fully depleted, a war, or something equally awkward, takes place and upsets the calculations of City 2000.

Nothing in this world is entirely without use we are told, so we endeavour to find the use of the Loadline Record. As work drops automatically when a Record is taken, cannot we have them more often, say once a week? It will at least ensure *one* day when telephonists may cease from their labours—a sort of rest-cure. It is just the same when high officials visit an exchange. One moment we will be ravingly busy. The next, when they arrive, it will seem as if a spell has been laid on all our subscribers. Never a calling signal glows. We sit idle, plug in hand "anticipating" and praying for some excuse for our existence. When a lamp *does* glow, three telephonists rush to answer it and even then there is a chance that it will be "teamed" from under our very noses! If they visited us more often, perchance we should ward off many a nervous breakdown.

Seriously, though, can anybody suggest something really efficacious in this matter?

DOROTHY TURNER.

A brilliant and most successful fancy dress social and dance was held on Oct. 12 by the Liverpool Trunk Telephonists in answer to an urgent appeal for funds from the Liverpool Children's Infirmary. A ladies' orchestra gave their services and supplied the latest dance music. Musical items and recitations of the highest order were rendered by the Misses Talbot, A. L. Jones, Simcoe, Lewis, Tittensor, G. Johnson, and Warrinder, each artiste receiving a well merited encore.

The parade of fancy dress exceeded all expectations for artistry, humour, and originality, and prizes were presented by interested friends and awarded to Miss Fidler, prettiest costume (Persian Lady); Miss Warriner, most humorous (Lady Slavey, "some 'opes"); Miss Dixon, most original (1850 jumper); Misses Mahoney and Dutton—most suitable and taking couple. Two suprise prizes were awarded to ticket holders bearing lucky numbers.

Miss Johnson, Chief Supervisor, in the chair, carried out her duties in a most able and charming manner, and in a neat speech outlined the generous support given by the telephonists to this urgent appeal. During the evening, a visit was paid by our well-esteemed Postmaster and Mrs. Simpson. No effort was spared to realise money—all necessaries, including refreshments, being supplied by telephonists and friends.

It afforded great satisfaction and pleasure to hand a cheque for £50 to the Treasurer of the Fund.

Some mention should be made of the untiring efforts of Miss Talbot in her heavy role of chief organiser.

(LIVERPOOL.)

The Exchange Alphabet.

(Lines suggested at a farewell gathering at Stockport.)

A is for "Answer," a prompt one's required,
B is for "*B*.B." which makes us all tired.
C for "Call Office" where good people go
To ring up their friends, whose "speed" is "dead slow."
D is for "Dials," yes, *sometimes* they fail,
E for "Engaged" when subscribers grow pale.
F "Fire Alarm"—how we all love the drill!
G for the "Gaffer" who makes us sit still.
H is the place where we all have to go
When we're put on "Enquiries"—at least, we think so!
I is the "Ink" with which we sign on,
J is the nib with which it is done.
K is for "Kettle," a good friend and true,
L is for "Locker," which holds things to chew
M is for "Monitor," working so hard
N for the "Numbers" she writes on the card.
O is for "Order Wire," shirk it who can,
P is *the* Party (our best thanks to Fan).
Q is for "Questions," of which we get many
R for "Relief"—ten minutes, if any!
S is for "Sallie," that friend of our youth,
Who gets somewhat "Breezy" when told the plain truth.
T is for "Teas," let's all have another,
U is for "U" whom we love like a brother.
V is for "Vanish," which you will soon do
From switchboards and telephones—wish we did, too.
W our "Wishes," so true and sincere
That you may have Happiness, Health and Good Cheer.
X for "Xchange" with staff so select,
Y for the "Youngsters" in "Glad Garments" decked.
Z is a puzzle which we will give up,
So let's all be merry, and pass round the cup.

(STOCKPORT AUTOMATIC EXCHANGE.)

The following pathetic lines (inspired by the fresh air sex) were contributed by a male reader:—

The Open Window.

Sing a song of tuberculosis!
Petrified feet and frozen noses.
Wat'ry eyes and husky gizzards,
All through sitting in Arctic blizzards.

Sing a song of influenza!
How you meet your latter end's a
Matter you have small concern in—
Might as well die cold as burnin'.

Sing a song of double pneumonia!
Such a death is surely only a
Swift transition to life eternal,
A glad relief from draughts infernal.

Sing a song of harp and halo!
Cloven hoofs and the devil's tail oh,
A chilly Heaven may suit the ladies:
I'm in the mood to appreciate Hades!

L'T.S. SWIMMING ASSOCIATION GALA.

To which a member of the F.A.S. replies :--

And the Closed !

Sing a song of Phthisis,
Deadly Bacilli,
Half-a-dozen "fair ones"
Baked—they know not why.
Not a window opened,
Coughs—both loud and strong;
Isn't that an atmosphere
To *breathe* in all day long!

Sing a song of Microbes,
Mouldiness and frowst;
Half-a-million fatal Germs
Snugly fed and housed.
Faces white, unhealthy,
What a noxious set;
Aren't men the stuffiest
Race you ever met!

By the kindness of a reader of our column, we are enabled to present half-a-guinea to the winner of the First Prize in the Amusing Incident Competition. We are, therefore, extending the time limit to Dec. 31.

The Road to Advancement.

The only road to advancement is to do your work so well that you are always ahead of the demands of your position. Keep ahead of your work, and your work will push your fortunes for you.—HAMILTON W. MABIE.

LONDON TELEPHONE SERVICE NOTES.

London Telephonists' Society.

On Wednesday, Nov. 22, the second meeting of the session was held, when Mr. H. L. Pountney read a paper on "The Opening of New Exchanges." A full account was given of the multitude of items that need attention before, at the time of, and immediately following the opening of a new exchange. Mr. Pountney confined himself to the field of activities in which the local traffic staff are chiefly concerned and described the process stage by stage from the time the advices are received giving particulars of the subscribers' circuits involved.

In a congested area like Central London, it is inevitable that when a new exchange is opened a large number of existing subscribers are required to change their numbers, and many difficulties arise, first of all in persuading recalcitrant subscribers that the transfer of their circuits is for the ultimate advantage of themselves and others. The large majority of subscribers accept the position without comment if without enthusiasm, but there are always a few who object, some to the name of the new exchange, others to the numbers it is proposed to allot them and some, it is feared, for the sheer joy of objecting. Such objections shed a light on the necessity for the judicious selection of the names of new exchanges and the careful allocation of telephone numbers.

Time did not permit an account being given of the part played by the Engineering Department, but it was mentioned that so accustomed had we become to its delivery of the goods and so much is its work done behind the scenes (and down manholes) that it seldom receives the general praise it deserves.

Mr. Pountney went on to describe the steps taken to train the operating staff in the use of the new equipment. Coincidently the apparatus is tested as frequently as possible with the two-fold object of detecting faults and giving the telephonists practice on the new equipment.

Many other items were mentioned which have to be attended to before the great day arrives when the exchange takes its place in the system.

The paper was concluded with a description of the opening ceremony.

In the discussion which followed, Mr. Pink said that he thought Mr. Pountney's paper would serve the useful purpose of inculcating keenness into every one concerned in an exchange opening. He gave us, too, as Mr. Buckeridge remarked later, another glimpse of his vision—a splendid vision of future growth. He touched also on the difficulty of naming new exchanges—so many factors having now to be taken into consideration before a name is finally chosen.

Miss Bott, in intensive, indignant phrases, told a tragic tale of thwarted enthusiasm. It appears that the whole staff is prepared to be wildly excited when a new exchange is opened; but by the time that *five* abortive attempts have been made to get a supply of designation strips for the new junctions, "the tumult and the shouting dies," and hopeless resignation sets in. It is to be hoped that steps will be taken towards the prompt supply in future of all the mundane requirements of an exchange opening, in order that this praiseworthy initial spirit may be fostered and maintained.

Miss Davidson expressed succinctly her views with regard to Traffic Instructions, which she would like expressed succinctly! She quoted Hamlet—"Brevity is the soul of wit." This thought was formulated still earlier (about B.C. 446, in point of fact) by the gentleman named Sophocles—"Many wise things are bound up in short speech;" and if the Lord High Traffic Instructioner will take this for his motto—substituting "few words" for "short speech" he will earn Miss Davidson's undying gratitude.

Miss Davidson then told a tale of a Civil Servant who, on being called on his private wire on an official matter at 9.30 a.m., exclaimed: "Good heavens! Have you fetched me out of bed to tell me that!" The breath of sheer horror expelled at this juncture by the meeting, was happily *dis*pelled when Mr. Dive (who seemed to have an uncanny inner knowledge of the whole affair) explained it by saying that we all must realise that the Civil Servant in question had been wrestling all night with a tough intellectual problem connected (naturally enough!) with the Service, had gone to rest at 8.45 a.m., and had almost immediately been awakened by the harsh sound of the bell.

A pleasing innovation was a musical half-hour before the meeting. Mr. L. G. Hawker gave a Pianoforte Recital which was much appreciated by those who came early. It is the intention to repeat this feature at all future meetings.

L.T.S.S.A. Social and Prize Distribution.

The Swimming Association held its Social at the Horticultural Hall, Westminster, on Friday, Nov. 3. There was a good attendance, and an early start was made with dancing. Later on there were songs by Mrs. Hunter and Messrs. Alfred Cracknell and Robert Barry.

Halfway through the evening the music and dancing was relegated to second place, which time Mrs. G. F. Preston very graciously handed the prizes to those who won them at the two galas. Several of the recipients made more than one journey to the platform and all received a few well-chosen words of praise from Mrs. Preston, who on these occasions, and later in a charming little speech, gave an admirable exposition of the "smiling voice."

The Controller brought the ceremony to a close by responding to a note of thanks to Mrs. Preston.

Mr. E. A. Pounds acted as M.C. assisted by an able body of workers.

L.C.C. Lecture Courses.

The series of Lecture Courses arranged for the staff of the London Telephone Service by the L.C.C. City Literary Evening Institute during the early summer months, was well supported, and the L.C.C. have made arrangements to provide a similar series of lectures, including several additional subjects, for the winter months. Lectures have been provided in the following subjects:—Psychology, Elocution, English Literature, Art Appreciation, Economics, French, Public Health, Social History, Music Appreciation, Greek Literature, Country Dances, Choral Music, and Physical Exercises. Over 200 students from the London Telephone Service have enrolled.

Culled from the Exchanges.

City Exchange.

The above exchange held their first dance of the season on Armistice Night at the Stationers' Hall. The "great day" was celebrated in a festive manner and balloons, toys, hats, streamers and Carnival balls were in great evidence, and the din at times took one's mind back to "Zero hour." Further dances are being held at the same hall on Jan. 15 and March 10 and those desiring to be present should book their tickets from Miss Eastell at once, as the demand for tickets for these dances has so far always exceeded the supply.

Victoria Exchange.

On Tuesday night, Sept. 26, at St. George's Baths, the Willow S.C. (Victoria) held their first gala. The Hon. Sec. Miss O'Connor, Hon. Treas. Miss Tripps (who was also chief whip), and indeed all the members of the committee should be commended on the way they co-operated to make the evening such a success.

The enthusiastic support given by the President, Miss Ashmead, Chief Supervisor, and Vice-President, Miss Lucking, was much appreciated by all.

The chief events were those open to the whole Telephone Service. The Supervisors' 30 yards Race was won by Miss Hare (Victoria) off scratch. It was one of the most popular victories of the evening, only gained, however, by inches, from Miss Stansfield (Avenue), with Miss Osler (Central) a good third.

The 60 yards Open Handicap produced a close contest, particularly in the final, in which one yard covered the first three. Miss Hawley (Hammersmith) 19 secs., Miss Phipps (Regent) scratch, and Miss Andrews (Hammersmith) 19 secs., finished in order named in 1 min. 17 secs.

The Plate Diving Competition was won by Miss Fern (Victoria) with Miss Amos second. In the Open 120 yards Team Race, Regent (Misses Phipps, Broomsgrove, Amos, Cole) won by 6 yards from Victoria (Misses Fern, Hare, Johnstone, Amos), the latter finishing 2 yards in front of Central (Misses Cole, McNee, Knight, Millbank), time 1 min. 43 2-5 secs.

The Club Learners' Race was won by Miss Mann, Miss Dyer being second.

The Club 30 yards Handicap resulted, Miss Hare, 7 secs., 1; Miss Fern, 1 sec., 2; Miss Amos, scratch, 3. Inches covered the three. Time 44 secs.

The Engineers' 60 yards Handicap resulted, Mr. Bremer, 1; Mr. Allen, 2. The result of the Water Polo match arranged between the City of Westminster S.C. and Fire Brigade S.C., was a victory for City of Westminster S.C. by 4 goals to *nil*.

Miss Ashmead then distributed the prizes accompanied by cheers from the enthusiastic onlookers. A word of thanks is due to the Regent Exchange Orchestra who supplied the musical interludes, adding the finishing touch to a most delightful evening.

City District Dance.

The event of the season in the City Traffic District took place on Nov. 4 last when the Annual Dance was held at the Royal Horticultural Hall, Westminster. Last year the dance was held at Australia House, when the demands for tickets far exceeded the number issued, and in order to avoid similar disappointment this season, early arrangements were made to obtain a larger hall.

Five hundred and fifty dancers came to "Chase the glowing hours with flying feet," assisted by the excellent music of Leonard Coombs' Orchestra, specially augmented for the occasion, and the Horticultural Hall with its midsummer exhibition of flowers could hardly have looked more happy and gay.

The affair was announced as a dance but before the orchestra struck up it was apparent that the description was inadequate and King Carnival took things in hand. Most elaborate fancy head-gears were distributed and either by the most extraordinary chance, or what is more likely by impish design, some very grotesque results were observed, especially amongst the "heads." Toy "musical" instruments were also distributed and added to the fun, the performers obviously enjoying it most.

All the arrangements were excellent, and the promoters are to be congratulated on their success in organising a most enjoyable and memorable evening.

Regent.

On Oct. 27 the Regent Swimming Club held a Social, when the prizes were presented to winners of club events. It was a very jolly affair and heartily enjoyed by all who attended. Mr. Pounds was M.C. During the evening he made a happy speech, in which he mentioned the prowess and exploits of the members of the Regent Swimming Club. The latter has now many trophies to its credit, not the least of which is the Pounds Challenge Cup.

A bran tub, with its irresistible lure of mystery, added to the merry-making—and the proceeds—of the evening.

WIRELESS COMMUNICATIONS.*

BY LIEUT.-COL. C. G. CRAWLEY, R.M.A., M.I.E.E.

THE second meeting for the present session of the Edinburgh Telegraph and Telephone Society was held under joint auspices with the Edinburgh Radio Society, on Nov. 7. A large and representative audience filled the hall of the Philosophical Institute, and in introducing the lecturer, the Chairman, Brigadier-General Price, said that the association of the two societies for the mutual furtherance and discussion of a technical and scientific subject of such world importance as wireless telegraphy was exceedingly gratifying. He added that great as the advance had been in the spheres of the theoretical and the present-day practical application of wireless, we were as yet only on the threshold of what would ultimately be achieved by present and future generations, but in welcoming Colonel Crawley that night they had an opportunity of hearing an authority on the subject of world and Imperial Wireless Communications.

With the aid of a chart, maps and indicator flags, Colonel Crawley proceeded to take the audience over the scheme of wireless communications as they had developed before and since the war, touching upon the problems that had been set and in most cases overcome, and explaining those which remained to be solved.

Referring to wireless broadcasting, the lecturer said that this was a subject of wide interest at the moment, especially to all who have themselves embarked on wireless communication in one form or another.

Broadcasting was quite new in this country. In the United States of America they had been broadcasting for over two years; and there they had been working with almost no restriction, broadcasting and receiving just as they liked. But while this might be done in America, which covers such a large area, it would be quite impracticable in England; and even in America many difficulties had arisen. It was therefore decided in this country that regulations, which the lecturer explained at length, should be made for the broadcasting services in addition to those for what might be called genuine experimental work.

In referring to the Imperial Wireless Chain, the lecturer said that it might be said to have really started in October, 1900, when the Marconi Company commenced the erection of a high-power station at Poldhu in Cornwall, the first large station in the world. It was erected to transmit messages to Newfoundland, and the idea was ridiculed by many—even by some of our leading scientific men who proved that signals could not be sent so far, for various reasons, such as the curvature of the earth. Marconi succeeded, however, in sending signals to America in 1902, and in the following year a wireless service was started to ships, a service which is still by far the most important work carried out by wireless.

In 1904 the Poldhu station commenced a commercial service to Cape Cod in Newfoundland. This was our first Imperial link, and was forged by Senatore Marconi and his enthusiastic assistants. Later Marconi decided to build another station, at Clifden in Ireland, which opened up a service with a station in Nova Scotia. An agreement between the Post Office and the Marconi Co. for the construction of a chain of stations throughout the Empire was signed in 1913.

The War, however, upset completely this scheme for providing an Imperial Wireless Chain. Wireless was required to serve strategic ends only, and control was taken over by the Admiralty, who erected over a dozen ship and shore stations for strategic communications throughout the Empire. Other countries had no such strategic need. They had not world navies nor world empires. Point-to-point communication was more necessary for them. France has now, therefore, five high-power stations, and nine stations abroad, many of which were started during the War. Italy has two at home, and two abroad. Germany has three at home, and had two abroad—one in Togoland and one in South Africa. The United States of America have about 15. Germany sent messages by wireless for ships, &c., to Africa, where they were received and sent broadcast, an arrangement which was of very great assistance to her at the beginning of the War. In this country at the moment we have only two high-power stations, largely owing to our War policy. One is at Carnarvon, the Marconi Company's large Trans-Atlantic station, the other is near Oxford, the Post Office high-power station which works with Cairo and carries out press services to Halifax, India, and ships, as well as broadcasting Government news messages for reception all over the world.

In 1919 the Imperial Wireless Telegraphy Committee was appointed to consider the whole question, the basis of their recommendations being that two chains were to be established, one from England to South Africa *via* Egypt and Kenya Colony, the other to the East *via* the second station in Egypt. At that time it was not considered practicable to have a commercial service over such long distances as between, say, England and Australia, but developments have been so rapid that the intention of erecting a station in Kenya Colony and a second one in Egypt has been abandoned, while

* Paper read before the Edinburgh Telegraph and Telephone Society.

Digitized by Google

the erection of stations at Singapore and Hongkong is deferred, at any rate, for the present.

A large Government station is to be erected by the Post Office in England, and its site is now being selected. The South African Government has entered into an agreement with the Marconi Company for the erection of a station in South Africa. In India, the matter of the erection of a station is being arranged between the India and Home Governments. The Australian Government has decided to put the erection of their station in the hands of a local commercial company; while a Canadian Government representative is now in London discussing the question of a Canadian station.

A brisk discussion by the audience followed the lecture, several questions in regard to broadcasting matters, the law of copyright, wave lengths, transmitting, licences, &c., being raised, which Colonel Crawley dealt with in reply.

Votes of thanks to the lecturer were moved by Mr. Percy Morris of the *Scotsman*, and by the Vice-President of the Edinburgh Radio Society, while Major Jayne summed-up and moved the vote to the Chair.

The next meeting on Dec. 5 will be addressed by Miss Nora Milnes, Director of the School of Social Training and Study, on "The Economic Position of Women."

HOW THE TELEPHONE WORKS.

BY A. CROTCH.

IV.

The cycle of operations involved in "getting through" are shown in Fig. 13. Where a lamp is shown full black, it indicates that the lamp is actuated or is glowing. First, as stated near Fig. 10, when the subscriber lifts his receiver he bridges the two lines of his loop by his induction coil (one winding) and transmitter.

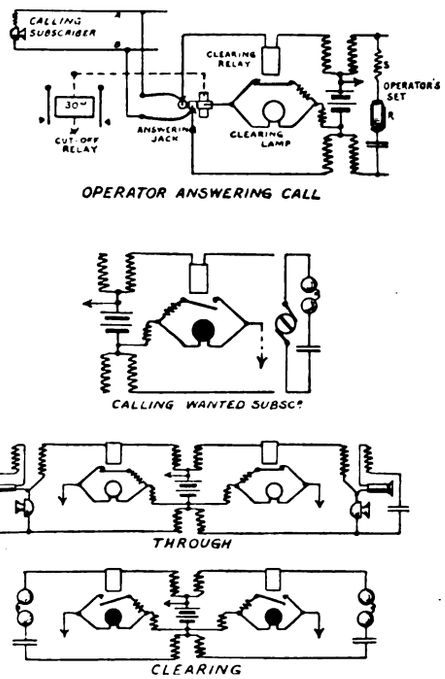

FIG. 13.

This allows the current from the common battery to flow round the circuit, through the contacts of the cut-off relay and coils of the line relay. The latter is actuated and causes the calling lamp to glow. The operator inserts the answering plug of a pair in the subscriber's answering jack and we have the conditions shown in the first part of Fig. 13. First, the shank of the plug being in contact with the bush of the jack, current from the battery passes through the clearing lamp to the coils of the cut-off relay. The latter is actuated and its contacts open, cutting off the line lamp and relay and the battery. The latter, however, is restored by means of the tip and ring of the plug. The current passing through the clearing relay closes its contact and puts a shunt on the lamp, diverting sufficient current to make it cease to glow. The operator's set, it will be seen, is in the position to be occupied later by the wanted subscriber and is through to the calling one. On hearing the number required, she takes the calling plug of the pair, but before inserting it, touches the bush of the wanted subscriber's jack with the tip to see whether the latter is free. If free, nothing happens, but if already engaged, the negative pole of the battery will be connected to all the bushes of that subscriber. The tip of the plug having the positive pole connected to it, an impulse of current will pass to the operator's set, and will give the warning click. Assuming the wanted subscriber's line to be free, the plug is pushed home and the generator applied. The supervisory lamp on this side of the cord circuit glows through the earthing of the shank of the plug through the bush and cut-off relay of the wanted subscriber; the relay receiving no current, its armature is unaffected and allows the lamp to glow. When the subscriber replies he sets up a path across his lines which allows the current to flow: this actuates the relay and the lamp is put out. This is the "through" position shown in the figure. When the two subscribers have finished and hang up their receivers, each disconnects his loop and puts the supervisory relay on his side out of action. The current in the lamp is then restored to its normal value and the lamp glows and gives the signal to the operator to clear.

Fig. 14 shows the speaking circuit, cleared of all apparatus except that necessary for speech. C. B. is the common battery

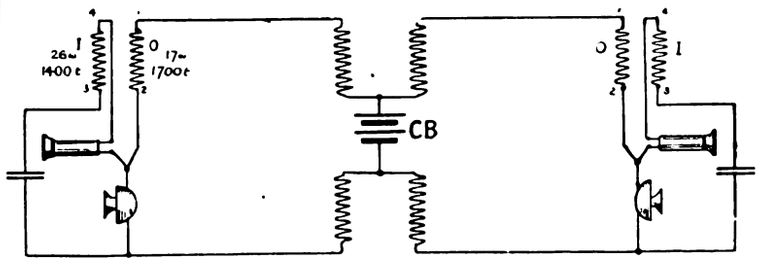

FIG. 14.

at the exchange, with its repeating coil. At the subscriber's end, one winding of the induction coil, plus the receiver and the condenser, are placed as a shunt across the transmitter. Normally a steady current flows. All the changes involved in speech resolve themselves into the rise or fall of resistance of the transmitter. Imagine that this suddenly falls: there is an immediate rise in the value of the main current on that side which will traverse the O winding of the home induction coil in the direction 1—2. Further, the lowering of the transmitter resistance reduces the potential difference across its terminals and this is followed by the freeing of a certain amount of the charge in the condenser. This portion of the charge passes through the I coil in the direction 3—4 (and through the receiver) and the inductive effect of this impulse is to set up another in the O coil in the direction 1—2. But this is in the same direction as the original impulse of increase, that is, both effects are additive and the combined result is a flick of current through this side of the repeating coil in the same direction as the main current. The inductive effect on the other side of the repeating coil is an impulse in the opposite direction, opposed to the direction of the permanent flow. This passes through the O winding of the listener's induction coil inducing an opposite impulse in the I winding, which actuates the receiver. The condenser tends to sharpen up these impulses.

TELEGRAPHIC MEMORABILIA.

To all engaged in the worthy art of Telegraphy, and its estimable sister, Telephony, A Happy New Year! A trite saying but none the less sincere. Whether these arts are conducted by the medium of physical circuits, phantom circuits or the still more elusive medium of the ether matters not. Once again, then, A Happy New Year! At home or abroad let the sincerest message fly and that, as our correspondence and subscribers' list show, is to the far corners of the earth, if really there be corners on a terrestrial globe, which quibble may be admitted when one's pen scribbles a hopeful paragraph at the commencement of another year. What developments in the dual arts of telegraphy and telephony are likely to materialise in the coming twelve months it is perhaps wiser to refrain from putting down in b'ack and white. It is much safer to prophesy for the centuries than for the months to come, and very unwise to fix the dates of future new discoveries. So we will wait and plod on in patience, alert to new ideas and new methods, with just that tinge of sane conservatism which recognises that *all* that is old need not necessarily be obsolete any more than anything that is modern may merit the scornful designation of "new-fangled."

Telegraphy during these long months of depression has followed the curve of reduced trade and its approach to stagnation as it must of necessity do seeing that it is a true indicator of the business pulse of all nations. There are, of course, other factors which so far as the British Post Office is concerned, are local changes of the habits of our people and the methods of administration which have of late years affected the amount of Press matter directly dealt with by Government hands. One does not nowadays see column after column of House of Commons speeches and rarely is even a Minister reported verbatim. We have reached the era of "Scrappy Bits" and selected morsels as far as Parliamentary reporting is concerned and the nights when "News" ran into thousands and thousands of words the sittings of the "House" regularly extending beyond midnight and the newspapers going to press at 3 a.m. and later are practically no more. Editorial and compositorial Fleet Street goes home to bed much earlier than was at one time the case, and there is no longer any necessity for special licences of certain hostelries. The transfer of much of the dissemination of news to private combinations has also added its quota towards reducing the special Press nights in the C.T.O. to events of the past, although the leasing of the wires to private enterprise has naturally done something towards assisting the credit side of the Telegraphs ledger.

The snow-storm which struck Germany in mid-December caused an interruption of the London-Berlin direct telegraphic communications which lasted for two or three days. Fortunately the town of Dusseldorf proved to be one of the few remaining connexions and as the latter was equipped with Siemens' apparatus London was very quickly utilising this emergency route. The London—Berlin Wireless Service also rendered useful assistance but the delay from certain countries beyond Berlin at times ran into 36 to 48 hours. It is feared that the method adopted of perforating a large quantity of Siemens slip and then in the event of bad working or complete breakdown, waiting for hours for restoration of the actual interrupted line before transmitting the traffic instead of diverting in approximate code turn by other routes is a temptation too great to be withstood by certain foreign administrations. It is as though they considered "perforated slip" as *transmitted* telegrams. Close adherence to the serial numbering of telegrams for each individual circuit appears to necessitate the destruction of the original slip and the reperforation of the entire series of telegrams is apparently another cause which naturally forces the traffic organiser of any office to hesitate to take this latter step, and to re-perforate perhaps some scores of telegrams; consequently telegrams arrive in an irregular order of code which would shock the British Traffic Director beyond recovery. This may be the reason why Hamburg, the great German port and commercial centre, prefers a multiplex system as against an automatic telegraph installation of the Siemens type excellent as the latter may be. The former clears as it goes. Cologne wireless also did good work during the breakdown so that the diversion of traffic through other countries also rather hardly pressed for German communication was reduced to a minimum. Fortunately—or should I write unfortunately—the traffic with Germany was much lighter than usual or the breakdown would have proved a much more serious affair to business.

An announcement was recently made in the London Press in connexion with the contracts for new cables and the laying of the same by the Pacific Cable Board. The following particulars are excerpted as a matter of interest to the general reader. One new submarine cable of 1,313.75 nautical miles to be laid between Auckland, N.Z., and Suva Fiji. Also 539 miles between Sydney, N.S.W., and Southport, Queensland.

Kalabaskraal, near Cape Town, is reported as being the site for the new wireless station already mentioned in these columns. It is also stated that the new wireless rate will be eightpence less per word between the Union and the British Isles than the present cable rates.

As a Government official one welcomes the following words from the present president of the I.E.E., Mr. F. Gill, who has thrown himself so wholeheartedly into the duties of his post of honour. Coming from the lips of one who is a prominent official of a huge private electrical combination, his words come with special force and form a rather novel view-point, at least from the commercial and public side of British life: —

"Other things being equal, the nation best equipped with the means of production, communication, and transportation, will enjoy a great advantage in the race for commercial supremacy, and perhaps also in the search after national well-being. It follows, therefore, that a great responsibility is laid on those to whom is entrusted the means of communication, or who control those means, particularly so because it is at last generally recognised that competition is not an aid to efficiency in this business. In return for the grant of facilities to carry on its work, each grantee authority must ultimately recognise its duty to the public and must diligently and actively search out new means and facilities and also set about educating the public with regard to their need for communication. Efficient communication is the life blood of commerce and of national and international understanding and amity.

"The passive attitude of merely satisfying public demands must be abandoned and an aggressive attitude take its place.

"The assumption that lack of profit-earning robs a Government of the stimulus enjoyed by a public company; also that a Government department should not earn any more money than is necessary for it to be self-supporting, are both fallacious. Only let it be realised that communication means something real—that it is a tool for the benefit of the nation, a necessity—and who is more vitally interested in obtaining the fullest possible utilisation of that necessity that a Government? The stimulus of profit-earning to produce development is small compared with the stimulus which comes to a public department as trustee for the nation.

"But it seems also wrong to reason that a Government department should not earn something more than just enough merely to pay its way. With a large staff it is unhealthy that the idea should prevail that profit-earning is of no account. Without a surplus of income over expenses, there is no margin for unforeseen contingencies; service trials and research are likely to be adversely acted upon, and capital will be raised with greater difficulty. Further, there seems no reason why a Government should not include in the rentals a sum plainly intended to be a contribution towards revenue; it is difficult to see any reason why it is permissible, for the purpose of raising revenue, to tax, say, food, but not telephones, or why it is proper to make a considerable surplus on postage, but not on telephones. It would seem that the correct course is for the Government, if it operates the telephones, to raise from them something towards the National Revenue, and to pay such a return on the capital invested in the business as to make certain its ability to raise whatever money may be required to extend the business."

The coming twelve months will see some notable gaps in the ranks of the superintending class of the C.T.O., several outstanding figures being amongst those who will reach the age-limit during that period. Oh, no, I am *not* going to risk naming those who are considered "outstanding." That would be a greater peril than being on a "Devolution" or "Promotion" Committee. They are, of course, all *outstanding, ipso facto*, of their rank!

The number of experimental *broadcasting* licences was over 18,000 up to the end of October or an increase of 10,000 since March 31, 1922. The London *Times* states that owing to "Fire Risk" the St. Pancras Estates Committee recommends "that applications from tenants of flats in the Council's dwellings to fix wireless installations be not acceded to."

A correspondent of the same newspaper complains that the Corporation of the City of London has refused him permission to erect an aerial on a building which is the property of that body. The building is a large block of flats of which the roof is flat and put to many uses by the occupants of the dwelling. The view taken by the Corporation was that if one such request were granted no similar one could reasonably be refused. The erection of a forest of aerials would make it impossible to use the roof for other purposes, but it is not to be assumed that an objection would be raised to putting an aerial on a roof of one of the Corporation's buildings if the amenities of the place were not thereby impaired, subject to the approval of the fire insurance company concerned.

Radio telephone broadcasting is about to be inaugurated in Cuba according to the *T. & T. Age*.

We gather from several sources that the Cunard Steampship Co. has decided to maintain its radio branch, so that every member of the crews shall be subject to the company's discipline. Hitherto the 50 operators in the company's fleet have been employees of the Marconi Co. The Cunard operators will wear a specially-designed uniform, and a senior operator will rank equivalent to a second officer of the navigating branch; junior operators will be graded as officers. The White Star and other lines do not intend, at present, to follow the Cunard example, but will rely on the Marconi Co. and other radio firms for their operators and installations.

The Soviet Government have given the officials of the Great Northern full liberty in the re-establishment of their lines across Russia to the Far East. They have permitted them to establish food centres, for example. All telegrams for East Asia by the company's route will be forwarded from Omsk. At present two lines, *via* Irkutsk and Peking and Kiachta and Harbin, are working, and telegrams from London to Shanghai can now get through in two hours. There has not been very great difficulty in repairing the lines, the damage done having been less than was expected. Danish engineers have examined the whole route, accompanied by Russians, who have learned to use the apparatus. Telegram rates in Russia were not raised during the war; most of them are unchanged, but some have been reduced. The Danish company expects that there will be great telegraphic traffic to the East *via* Copenhagen as soon as the new Russian stations are opened.

The first following paragraph is published on the authority of the *Financier* and the second on that of the *Morning Post*:—

> CABLE COMMUNICATION.—In order to maintain cable communication throughout the British West Indies, an agreement has been entered into between the British Government, the Dominion of

Digitized by Google

Canada, the Crown Agents for the Colonies, and the West India and Panama Telegraph Co., allowing the company to increase its charges. The agreement provides for increases in the existing maximum rates of 6*d*. per word on "through" rates, and an increase of one-third, with a maximum of 6*d*., for inter-island rates. Deferred Press and Government telegrams are to be carried at half the ordinary rates. These increased rates are authorised until March 31 next, and the future rates are to be decided by circumstances.

The Treasury considered various proposals to prevent the cessation of the company's system, including its purchase by the Governments concerned, but decided on the above policy.

According to *Le Petit Journal* of the 18th ult, M. Paul Laffont is about to submit to the Chamber of Deputies certain propositions in connexion with international and trans-continental telegraphy and telephony which that gentleman hopes will considerably ameliorate the present unsatisfactory working of these all-important communications.

The emphasis which the *Journal* places on these projects is rather on the condition of the telephones than on the telegraphs, but one can only add one's hope to that of the French Postmaster-General that the condition of the conductors of both systems will come very seriously under consideration.

Le Petit Journal with no uncertain voice drives home the facts of the growing practical isolation of France owing to the unsatisfactory state of her communications and clearly points out to the French public the possibilities of England obtaining trans-continental communications across Europe by circuitous routes *via* Belgium, Germany and Switzerland, thus cutting out even the possibility of income from way-leaves, not to speak of the loss to French commerce of the necessary facilities for rapid communication. It accentuates the present position by showing also that telephonically while Germany has connexion with Warsaw, Prag, Vienna and Budapest, France so far as these centres are concerned remains dumb!

Red Tape is a sure sign of age—red tape in both mind and manners. The ability to disregard red tape is the sign of vigour, honesty, and youthfulness, and will be so for all time.—Richard King in "Silent Friends."

J. J. T.

AN ADVERTISEMENT.

As a New Year's gift, the "School of Orators" is prepared to offer a complete course in speech-making at half the usual fees.

We can compile anything from addresses for Bands of Hope to Presidential speeches.

We specialise in "*skins*" and T. 18's; we can answer these with an eloquence that will favourably impress the sternest martinet.

If you contemplate making a speech as chairman or president of any Trade Union, Telephonists' Society, or the like, write to us for specimens.

We give below an abridgement of one of the speeches found in our publication "Half-a-dozen Inaugural Speeches for Students," including those entitled "What are we doing?", "How are we going?", "Why are we doing?", &c., &c.

"What are we doing?"

"Telephonists, yours is a noble calling! . . . Let each of us answer this question to-night, 'What are we doing?' Taken literally (like that renowned one 'Where are we going?') this question could be very easily answered. Let us consider it—if only for this evening—in its moral aspect. . . . How many are there, I wonder, who see nothing save uninteresting toil, yea, drudgery, in a telephone exchange? . . . The daily activities of an operator are full of wonderful possibilities. . . . Think of the unique personalities it is your privilege to come in contact with; take, for example, the subscriber—a most interesting personality; always ready with an instructive or pithy remark . . . Again, the supervisors—do you really appreciate all that you possess in your supervisors? I doubt it! Yet they are always willing to give you the benefit of a wide and varied experience in making your life at the exchange one of intense pleasure—always anxious to clear up any little misunderstanding that may arise between subscriber and operator. . . . Once again, the engineers—the men that have given their lives to the cause of science. I am sure you will agree that these are men of most attractive personalities—patient, polite, obliging, sympathetic, conscientious, always of a sunny temperament. . . . Do you appreciate it? If all operators only appreciated the honour of their calling we should have conversations on the 'order wire,' and elsewhere, free from all trace of malignancy, virulence, and malediction. . . . What are we doing? . . . Whatever you are doing you could, no doubt, do more. . . . Yours, telephonists, is a noble calling: be worthy of it."

Should you not require a presidential speech, you will certainly require an answer to a T. 18, therefore, write to our London Principal for particulars of courses, &c.

"CIVIL" (Gerrard).

EFFICIENCY IN THE TELEPHONE SERVICE.*

BY T. G. TUTTY, Telephonist (*Leeds*).

EFFICIENCY is the parrot-cry of the age and, regarded superficially, savours rather of the nineteenth century slogan "The survival of the fittest." In reality it means scientific management and scientific management means efficiency.

I want to talk of efficiency *in* the Service, rather than *of* the Service, because the latter is the direct result of the former. America, Germany and Japan have studied efficiency until they have made it a science. We in England are rather slow to adopt new methods, because of insular prejudice perhaps, but many English firms now realise the industrial importance of efficiency. I have often heard the Telephone Service of Sweden quoted in a way prejudicial to our own, but it is not a fair comparison when the conditions and methods of working are different. There is no real reason why we should not have the finest Telephone Service in the world, but it is necessary first that we should have a clearly defined ideal and a true conception of our work and its aim.

As a State-controlled industry the telephones are primarily a public service and not a profit-making concern. We must try and keep sight of that important fact in spite of the present expensive economy campaign.

Efficiency is not dependent on one factor but on many. Everyone in the Telephone Department from the head of affairs to the youngest probationer, is responsible in a greater or lesser degree for the Service. The equipment, the subscriber and the staff are the "Big Three" of the telephone world. With the first two I will only deal briefly.

Up-to-date equipment is essential and it must be sufficient to meet normal and abnormal needs and also be kept in perfect condition. This of course is the work of the Engineering and Maintenance Department.

A subscriber has a telephone installed as a means of quick and direct communication, but in many cases he defeats his own object by delay in answering his telephone. Subscribers do not realise the importance of training one person for this particular work and thereby ensuring greater speed and accuracy in business transactions over the telephone. In speaking of the staff I am going to confine myself to the side I feel most competent to deal with—the exchange side. Many of my remarks, however, are capable of a general application. First and foremost there must not only be sufficient staff to meet ordinary traffic but an ample reserve for emergencies. The personnel of an exchange is, I think, one of the most important factors in the Service, and it is therefore essential that we should obtain the right material in the recruitment of our young telephonists and probationers, because amongst them are the controlling officers of the future. I think the Selection Committee should include a representative of the manipulative staff. I do not altogether advocate the American "once-over" system, but those who interview candidates should have some knowledge of psychology. The present system of enrolment at the Labour Exchange, would, I think, be well replaced by direct recruitment from the schools. The present method of education does not always give a proper preparation for an industrial or business career; but valuable information could be obtained from the school principals as to the efficiency and suitability of a candidate by a personal visit of the school matron. Whether the candidates when chosen become efficient officers depends on the training and the moral atmosphere of an exchange. I am not in a position to criticise the school training as I have not studied it closely, but I do think a practical knowledge of the switchboard first, would be helpful when receiving the theoretical instruction. Teaching is only successful when it interprets actual experience.

In speaking of the moral atmosphere of an exchange I am using the word in its broadest sense. We all radiate an influence of some kind, and consciously or unconsciously we are all affected by each other's personality. It is these accumulated influences that create the moral atmosphere. Here again we see the importance of having the right material at first. In selecting staff of any kind, but particularly for positions of responsibility, there is need to keep an even balance between intellect and character. The dominating force lies with those in authority, and we must not underrate the force of example and the influence it exerts. The foundation of an efficient service must be individual efficiency. It is of paramount importance therefore, that the head of an exchange shall be an efficient officer—a consistent disciplinarian—an exponent of justice and a student of human nature.

Industry cannot afford to be inhuman. An officer with the qualifications mentioned, would have none but efficient supervisors and the staff, as always, would reflect the influence of their controlling officers. Discipline is essential to efficiency, especially where the staff is large. I advocate discipline with this qualification—it must be exercised for a specific purpose and not for its own sake. Pushed to extremes it is soul-destroying. Discipline must apply to all, and is not the dictation of one to another, but the observation of rules drawn up for the Service. No person should be in a position to exact discipline from others who cannot exercise self discipline.

It is a great thing if controlling officers are gifted with imagination, coupled with broad minds and sympathies, so that while carrying out their higher duties they do not forget they were once operators. A controlling officer should be a specialist in the work she supervises and should be alert to detail while noticing the essential features of the work.

* Paper read before the West Yorks Telephone Discussion and Social Circle.

Digitized by Google

In the interest of the Service, a supervisor should see that no operator is exposed to undue strain, and to this end the load on each position should be equalised as far as possible. A telephonist should not be kept more than three hours at a stretch on a very busy position. Efficiency is not measured by a stop-watch and accuracy should not be sacrificed to speed. It is in the Department's interest as well as the telephonists' not to speed up to a point of fatigue and overstrain. Standardisation is necessary to efficiency, but to arrive at a workable basis an average of the capacity of the whole staff must be arrived at. It is merciless to expect the whole staff to attain the maximum of the quickest telephonist. Observation is superior to theory, but if the two are combined better results are achieved. The aim of the Service should be to ensure accuracy and a maximum speed with a minimum of exertion and discomfort to the staff concerned. Dealing with the staff generally, I think their work should be varied as far as possible, because routine destroys initiative and gives rise to a dread of responsibility.

The Service has become so bound up with regulations and the rule of thumb that there is no room for originality. If the Service is to be the best possible the health of the staff must be considered. Overwork is detrimental to health and therefore overtime should be eliminated as far as possible. A supply of disinfectant should be kept in a place easy of access for the use of telephonists going off duty. In this way much sick leave would be avoided because at the end of each duty the telephonist would disinfect her 'phone and make it clean for use next day. The work should be made as congenial as possible and the comfort of the staff provided for, so that they may get the full benefit of any rest periods or intervals between duty. Many officers look upon their work as a necessary labour and a nuisance, but if interest in the work were aroused there would be an immediate increase in efficiency. Interest eradicates monotony to some extent, and a knowledge of the relationship of the work performed to the rest of the Service would engender interest. There must be perfect organisation in our exchanges not only of time, material and energy, but of ability.

We must study the potentialities of the staff, and those officers who are selected for special duties should be shown the best and easiest methods of performing the work required. Exchange records should be kept up to date and every officer should be cognisant of new instructions. Official instructions are not by any means as clear or concise as they might be. They are non-committal and equivocal and are therefore liable to misinterpretation. The staff should not have to read instructions while engaged on other duties but be given time to peruse carefully and, if necessary, a superior officer should explain the precise meaning of the new regulation.

Records and returns play an important part in efficiency. They indicate variations and tendencies of traffic, due either to trade fluctuation or a change in methods of working. Inaccuracy not only makes a return useless but may lead to serious miscalculations in equipment and staffing. Without the knowledge of the relationship of one return to another and to the Service as a whole, a record loses its full value. Statistics are essential to the working of an exchange but they should be coupled with observation and practical knowledge to make efficient use of them. The faults and difficulties of the Service will be revealed by a minute analysis of the Monitors' dockets.

The Monitorial Board is not only an information bureau but a "First Aid Dept.," and it is therefore essential, that the staff on these positions should have a complete knowledge of the work, coupled with tact, diplomacy and patience. Directories and index cards should be up to date and easy of access.

The duty of tracing is an important adjunct of monitorial work, and the staff should not be allowed to perform this duty as they like, but trained to do it scientifically. It is essential that the tracing staff shall be both efficient and sufficient to ensure a complete investigation—accurate information, and a speedy reply to enquiries.

It is in the interest of efficiency that exchange managers shall be on duty in the exchange the greater part of the day, not only to deal with emergencies, but to have a complete knowledge of traffic, staffing, and working conditions. All offices should be kept as bright and airy as possible, because environment materially affects the staff and therefore the Service. Subscribers should be encouraged to visit the exchanges to get a more intimate knowledge of telephone working. There should be co-ordination between each section of the Service as they are all inter-dependent.

In conclusion, efficiency in the Service depends on perfect organisation. A perfect organisation will remember that the human element plays the most important part in industry, and will therefore study the principles of hygiene and psychology, including aptitude, temperament and interest; and the laws governing expenditure of energy and fatigue. There must be a harmonious adjustment of every branch of the Post Office Telephones, in the endeavour to realise the true conception of a public service.

Pessimists will say this is an impossible ideal but people of that kind never made anything efficient. I would remind you that an intelligent optimist is so, as much by determination as temperament.

If we all work in the right spirit and with sufficient determination, we can make the English Telephone Service the finest in the world.

IT may perhaps be of interest to our readers to know that the new book *Elementary Determinants for Electrical Engineers*, by H. P. Few, and the new (second) edition of *Electric Bells, Alarms and Signalling Systems*, by H. G. White, have been included in the Works of Reference recommended by the examiners of the City and Guilds' of London Institute.

LONDON ENGINEERING DISTRICT NOTES.

FROM the Staff of the London Engineering District to all co-workers—Greetings! May the year 1923 prove a very happy and prosperous one to all!

Unit Construction Cost.

Probably there is no combination of words so irritating to the average worker in the Engineering Department as that which heads this paragraph. It is believed that much, if not all, of this irritation would disappear if the reasons for the introduction of the system were fully understood.

There are some who believe that it was specially designed to irritate men and to change them from steady manual workers with a high output to composite beings, neither mechanics nor clerks, who spend one-quarter of the day doing a job, and the other three-quarters of the day in writing little tales about it to satisfy certain theorists at Headquarters who would not be tolerated in a private concern. Yet the greatest and most successful of the private concerns are those that pay the most attention to "costing" systems. In these days of fierce competition there is no room for the happy-go-lucky methods of the past. Every item of work must be analysed to ascertain exactly what each operation has cost. Wasteful and inefficient methods must be eliminated and replaced by scientifically sound and economical processes.

It is interesting to hear what Mr. Henry Ford says when writing about the Ford factory:—

> "I think one hundred dollars would buy all the office equipment in the factory—outside, of course, the cost department."

There is very great significance in the exception that is made, although it would readily be conceded that a cost department without manual workers would be useless, yet the usefulness of the workers may be increased many times if the cost department is properly manned, equipped and directed. Mr. Ford is as shrewd a business man as can be found to-day and he has no doubt about the importance of securing accurate costing methods. It is impossible to determine accurately the lowest price at which an article can be sold until the exact cost of manufacturing the article is known. As soon as the exact cost of manufacture is known methods of reducing that cost will be suggested. This will tend to reduce the selling price and lead to increased demand. The application of all this to the telephone industry will be apparent. The Department wishes to create a big demand for telephones, and with that end in view is adopting similar methods to those which have proved their worth in other branches of industry.

Economics.

The Engineering staff in London prides itself on knowing something about the theory and practice of economics. Every engineering operation performed can be justified from an economic standpoint. If it is found necessary to incur a cab fare rather than a train fare the traveller will be prepared to prove that the cost, having regard to all factors, is less, although the fare is more. A letter headed, "The Unpopular Taxi-cab" in one of the evening papers must have shocked every P.O. Engineer who read it. The letter explained the need for the present high taxi charges as follows:—

> In pre-war days the fare was eightpence a mile. To-day it is a shilling.
>
> With the extra fourpence per mile the taxi-cab proprietor has to meet the increases on expenses as follows:

1914.	1922.	Increase.
Cost of cab £375	£700	86%
Road tax £2	£15	750%
Petrol 10*d.*	2*s.*	140%
Garage 17*s.* 6*d.*....	23*s.*	31%
Accessories and spare parts ...	—	45%
Repairs	—	80%
Compulsory overhaul	—	80%
Wages	—	80%

> This makes an average increased expenditure of 129 per cent. to be met by an extra 50 per cent. in fares.

How 129 per cent. is arrived at is not clear. If the average of the percentages is taken—161 per cent. is obtained. No attempt has been made to weight the percentages, and the increased first cost of the cab is thrown into the "per cent." pool without any attempt to reduce it to an annual charge. It is a good thing that such arithmetical methods were not adopted by the Post Office when working out the increases on the telephone tariff.

Loud Speaking Telephones.

Since "Wireless" has become a household word quite a crop of "loud speakers" has been introduced. Several of these are based on a principle patented by Sir Oliver Lodge so far back as 1898 and described in Specification No. 9712 which was registered on April 27 of that year.

The objects of the invention were described as follows:—

> The chief objects of my invention are to provide means for the audible detection of extremely feeble fluctuating electric currents such, for instance, as may be caused in a closed, or practically closed,

Digitized by Google

circuit by another very distant circuit supplied by alternating currents; to magnify the telephonic effect of feeble currents by successive specially designed relays until the sound is sufficient to act as a "call" summoning the operator to attend to receive the message; to magnify the telephonic effect of speech so that conversation transmitted round one circuit may be heard inductively in a different circuit provided with proper instruments; and generally to improve the conditions under which telephony is carried on so as to magnify enormously every fluctuation of current and thus produce a loud sound from a feeble stimulus for any useful purpose.

The basis of the invention was a light wire coil supported elastically in strong magnetic field in such a way as to be thrown into vibration under the action of an alternating or intermittent current traversing the coil. The inventor built up a series of relays by attaching a coil to a transmitter diaphragm and arranging the circuit so that the current in one transmitter circuit was passed round the suspended coil of the next relay in the series. At the end of the series the coil was attached to a diaphragm suitable for imparting vibrations to the air and so to the ear. Sir Oliver Lodge gave a demonstration of his amplifying apparatus at the Institution of Electrical Engineers, and the voice of a speaker in the basement was heard clearly by the whole audience.

The objection to such a device was of course the distortion due to the inertia of the suspended coil. However light the coil is made—it was constructed of aluminium ribbon on a frame of the same metal—distortion is apparent, and the greater the number of stages of amplification the more apparent is the distortion. The modern loud speakers built on the same principle have the same defect.

Some 15 years ago the writer of this note conducted some experiments with apparatus built up on the Lodge principle. Music over an electrophone circuit from the Palace Theatre was amplified, the coil in the last unit being suspended from a large wooden diaphragm mounted at its nodal points. The result was not good for the reason already mentioned; volume was ample but articulation poor. The introduction of the thermionic valve with its inertialess action put all mechanical devices out of court. Until a loud speaking telephone independent of a suspended coil or similar part subject to the laws of momentum is introduced the perfect loud speaker will not be available.

Gas Masks Required.

Cigars have been so plentiful lately that non-smokers are requisitioning gas masks. Others are becoming bilious in their endeavours to show their appreciation of their colleagues' success by smoking cigars of a quality to which they are unaccustomed. We trust that the rumours of further promotions will not end merely in smoke.

THE GENERAL ELECTION AND THE C.T.O.

By W. H. J.

HOWEVER justified the statement may be that the British Public took but a passing interest in the recent General Election, the Telegraph service certainly is not allowed to assume the same tranquillity in regard to this great national event.

With the progress of time many changes are produced, one notable change being that the average citizen does not now remain out-of-doors until long after midnight to hear the Election result in his particular constituency; he much prefers, and wisely too, to keep to his normal hours of retiring to bed, confident that the morning newspaper will contain the majority of the Election results from all over the country. Changes too have taken place in the Telegraph service, generally, in matters connected with a General Election and this is nowhere more noticeable than in the Central Telegraph Office. For the purpose of comparison, we must go back to the General Election of 1910; the General Election of 1918 differed from all others as the counting took place a fortnight after the Elections to allow of the inclusion of the overseas votes. Twelve years ago Press Agencies and newspapers were in keen competition to be the first to receive and distribute the speeches of notable Ministers and leading members of political parties, and proud was the reporter who could add to his telegram the words "first message handed in." At that period reports of speeches were in the main, dealt with, telegraphically, by means of the Wheatstone, a system which compared with more recent developments and improvements, appears laborious necessitating as it does numerous wire lengths and a large staff to prepare the Wheatstone slip at one end and in transcription of the Morse slip at the other. With the comparatively recent developments of the Creed, and installations of the Baudot, together with the combined organisation of news agencies, newspaper copy is transmitted and delivered much more rapidly.

By way of illustration, a verbatim report of Mr. Lloyd George's speech at Glasgow, comprising 105 pages in all, was transmitted to the C.T.O. over the Baudot system and delivered to the Press Association within ten minutes of the time of handing in of the respective pages. It seems but a few years since, on the occasion of a speech by Mr. Asquith at the same town, newspapers and agencies would be enquiring at 2 o'clock in the morning for the concluding pages of the speech.

Nov. 4 was the day fixed for nominations, and immediately after 12 noon on that date nominations began to pour into the C.T.O. from all parts of the United Kingdom, and within 90 minutes of the closing hour for nominations the whole of the nominations were delivered to the Press Agencies.

The results of the Elections in London, English Boroughs, and a few counties, were received in the C.T.O. for delivery on the night of Nov. 15, and the remainder, with the exception of the Universities and the Orkneys, were received on the 16th.

These results were almost immediately received back from the Agencies, in the form of Press telegrams for distribution to Provincial agencies and newspapers. The transmissions were made by means of the Wheatstone system and in the majority of cases, simultaneously to a number of towns in circuit on the same wire length.

A much wider field of communication was possible on this occasion; some 4,000 words of Election results being transmitted to Canada and Australia by means of the Imperial Cable.

An interesting feature of this General Election was that telephone exchanges not only informed subscribers of the result of local elections, but, by the courtesy of the Press agencies, were enabled to give information regarding the state of the parties and of the elections in which prominent politicians were concerned. This information was obtained by the Central Telegraph Office and communicated to the telephone service.

It is only to be expected with the growth of the telephone service, and of its nationalised character since the Elections of 1910, that much greater use should be made of the increased facilities afforded by that service, yet, despite this, there appears to be but little diminution in the use of the telegraphs for general distribution of news. It is, therefore, not surprising that the C.T.O. regards a General Election as an occasion requiring much thought and preparation, and that a special section was organised to work out the details of the necessary organisation and to ensure its proper working.

It would not perhaps be proper here to pay tributes to the successful organising to deal with the General Election pressure in the C.T.O., or to the manner in which the whole of the staff co-operated to efficiently carry out the work incidental to this great national event, but we may perhaps be permitted to mention that the Press generally have expressed their high appreciation and satisfaction of the manner in which the telegraph department had dealt with all Election news.

CORRESPONDENCE.

THE WAR SEAL FOUNDATION.

TO THE EDITOR OF THE "TELEGRAPH AND TELEPHONE JOURNAL."

Two years ago you very kindly published a letter from me in which I mentioned the wonderful support accorded us by the staffs at the various London Telephone Exchanges and appealed for support from the Provincial Exchanges.

One result of that appeal was the prompt, and since, continuous support from the Newcastle-on-Tyne branch of the Telephone Service and from which, to date, we have received the very handsome total of £56 18*s.* 0*d.*—no mean contribution in view of the many calls which we know are made on the staffs of the Telephone Exchanges for support of charitable works.

I may mention that, in addition to the 72 residential flats and treatment rooms erected in 1919, we are now hastening the completion of a further 65 flats on an adjoining site, the freehold of which has been given to us by our Founder and President, Sir Oswald Stoll.

Should other Provincial Exchanges care to follow Newcastle's good example, I shall be happy to accept what they have to offer.—Yours faithfully,

W. J. ROBERTS, Secretary.

P.O. ENGINEERING DEPARTMENT ANNUAL DINNER 1923.

THE Committee has arranged for the Annual Dinner to be held on Friday, Feb. 9, at the Connaught Rooms, Great Queen Street, W.C.2. Major Thomas F. Purves, O.B.E., will preside. A cordial invitation is extended to all members of the Engineering staff and also to any visitors who may wish to attend.

The Committee will esteem it a favour if you can see your way clear to make a small announcement in your JOURNAL drawing attention to the function with a view to making it as widely known as possible.—Yours faithfully,

H. J. LONEY, *Hon. Sec.*

Engineer-in-Chief's Office, G.P.O., E.C.

TELEPHONE DEVELOPMENT.

BY A CONTRACT MANAGER.

THE Government's proposals to counter unemployment may, or may not, include intensive extension of the telephone exchange system, but before I read the report on the "Government Works Plans" in the daily Press on Dec. 1, I had formulated the following remarks; and I still beg to submit them for serious consideration of those whom it concerns.

The present demand on all sides for improvement in trade and employment leads me to think that the telephone service can here play a part with far-reaching consequences.

It is a platitude to state that communication is the soul of business, but daily contact with a truth sometimes robs it of its significance. Telephony is foremost in the art of communication, and it seems natural, therefore, to assume that if the soul of business is improved, the result will be a revitalised industry, and the much-hoped-for state of affairs will be achieved; as instance:—with adequate communication agriculture can market her wares with less loss than marketing blindly. The consumer may demand goods at the time of need or fancy; the merchant may get direct contact with the manufacturer, and so on down to the basic source of supply. If time is money in business, then by saving time surely we must accumulate wealth, business must become stronger and surer and provide the much-needed employment as a natural consequence.

This is one side of the question. The other I consider to be of equally, if not greater, importance. By stimulating the use of the telephone, and by greatly extending the number of subscribers, the labour market is affected directly, and the demand for skilled engineers as well as unskilled labour is immediately apparent in the increased construction and fitting. The use of poles, wires, cables, insulators, telephones and switchboards in abnormal quantities immediately creates the necessity for placing further contracts to restore the balance of material. New trunk routes and new exchanges follow local development, and so on *ad infinitum*, and therefore many, and almost all of the allied electrical and engineering trades would be brought into play. Briefly, it seems to me to be a question of national importance at the present time that anything that makes for commercial efficiency is assisting towards the solving of our greatest problem. National efficiency cannot be more readily affected than by means of an improved and extended telephone system. The money expended would not be lost, as in the case of many schemes advanced for the cure of unemployment, but would be a permanent asset to the State, and an investment of a remunerative character. The orders necessary to extend the telephone system can be obtained by the Contract Department if given the right assistance. Double the staff for the next twelve months would mean practically double the orders. The cost of obtaining each order may be higher than normally, but it needs no words of mine to describe the effects of such returns. Of course, I am not alone in this matter, by any means; the possibility of telephone development throughout the country is tremendous, if properly tackled and catered for, and I recommend with all seriousness and earnestness of purpose that the time is ripe to undertake at once a continuous and intensive canvassing campaign so that remunerative work may be provided for at least some thousands of the workless. Many, I know, may indulge in a tolerant smile at such a proposal, but I know from experience of sixteen years' continuous canvassing that we are at present only touching the fringe of our possibilities.

PRIZE GIVING AT HOLLOWAY FACTORY.

AN interesting function took place at the Holloway Factory of the Stores Department on Tuesday, Dec. 5, when the Right Hon. H. Pike Pease presented the prizes to the members of the Holloway Factory and London Depot Technical Classes. Mr. Pike Pease although no longer officially connected with the Post Office, still takes a warm interest, which is deeply appreciated, in the lads' work, and again offers two prizes for competition. Mr. W. H. Allen, the Controller, in a happy speech compared Mr. Pease with Abou ben Adhem who loved his fellow-men; and then Mr. Pease, after a kindly and encouraging address to the boys, in which he urged them always to give of their best and to help others as they had been helped, presented the prizes. Mr. Geo. Morgan, the late Controller, whom everyone was glad to welcome, also addressed the assembly. Amongst those present on the platform were Mr. E. Raven, Sir Henry Bunbury, Mr. G. Slater, Mr. H. Sparkes, Mr. G. F. Mansbridge, Mr. F. L. Henley, Mr. A. Parsons, Messrs. Ingram and Thomas of the L.C.C. Education Dept., and Mr. C. E. Fenton, Staff Officer in charge of the Factory.

The prize-winners were:—

Factory Boys.

Rt. Hon. H. Pike Pease's Prize (£1 1s. 0d.)

E. A. Thorogood.

Examination Prizes (9s.).

A. W. Brooker, S. H. Dean, S. J. Wheatley, T. E. Dean.

Prizes value 4s. 6d. awarded for General Good Work.

C. S. Clark, B. F. Marsh, W. E. Cullen.

Depot Boys.

Rt. Hon. H. Pike Pease's Prize (£1 1s. 0d.).

H. Leadbeater.

Prizes value 5s. for Consistently Good Work.

F. B. Plumb, L. H. Stokes, H. S. Lawson, C. W. Lockwood, F. Bradford, L. J. Bayfield, A. W. Gugnoni, A. R. Burr, C. E. Lafosse, E. Allsup, H. S. Turner.

PROGRESS OF THE TELEPHONE AND TELEGRAPH SYSTEMS.

TELEPHONES.

THE total number of stations in use in the Post Office system on Oct. 31 last was 1,011,591. Of this total 362,345 were connected with exchanges in the London telephone area, and 649,246 with provincial exchanges. The net increase in stations during the month, viz., 5,818, was up to the average of recent months.

A large number of new call offices was opened during October, the total at the end of the month being 15,962, making the net addition for the month 124. This constitutes a record. Public Call offices in street kiosks numbered 344.

A further appreciable addition to the number of rural party line stations was made during October, the net increase, 388, being also a record. The total number of stations at the end of the month was 5,579, as compared with 2,711 a year ago.

The record of calls taken at exchanges with 300 or more direct lines during the week ended Oct. 28 last, indicates a slight improvement in the local call traffic, the average calling rate per line being higher than for any record since the introduction of the new tariff in April 1921. Compared with the corresponding record of 1921 the increase in the calling rate per line was 5.5 per cent.

The trunk traffic also continues to show signs of improvement, the number of trunk calls originated during the first half of the current financial year being considerably higher than in the corresponding period of the previous year. Excluding from the 1921 figures the calls originated in Southern Ireland the increase in traffic amounts to over 13 per cent.

Some statistics showing the general development of the service during the 7 months ended October are given in the appended table:

	TOTAL AT END OF—						
	April.	May.	June.	July.	Aug.	Sept.	Oct.
Exchanges ...	3,112	3,116	3,115	3,113	3,114	3,116	3,121
Exchange stations ...	942,671	947,534	953,931	957,476	962,852	969,126	974,959
Private wire stations ...	36,960	36,934	36,810	36,627	36,578	36,647	36,632
Call offices (stations)...	15,405	15,487	15,573	15,667	15,755	15,838	15,962
Call offices in street kiosks	275	289	305	317	327	335	344
Rural party line stations	3,747	4,101	4,408	4,671	4,894	5,191	5,579

Progress continues to be made in the development of the main underground trunk system and during the month of November new cables were completed and brought into use between Walsall and Wolverhampton and also between Darlaston and Wednesbury. Within the same period 20 new overhead trunk circuits were completed and brought into service, and 76 additional circuits were provided by means of spare wires in underground cables. A new exchange has been opened at Buxton.

TELEGRAPHS.

Baudot equipment has been provided for the Birmingham—Newcastle-on-Tyne—Hull, Cardiff—Liverpool—Newcastle-on-Tyne, Glasgow—Birmingham, and Central Telegraph Office—Preston—Edinburgh routes, bringing the total number of Baudot installations up to 53.

NOTICES.

As the object of the JOURNAL *is the interchange of information on all subjects affecting the Telegraph and Telephone Service, the Managing Editor will be glad to consider contributions, and all communications together with photographs, diagrams, or other illustrations, should be addressed to him at G.P.O. North, London, E.C.*1. *The Managing Editor will not be responsible for any manuscripts which he finds himself unable to use, but he will take the utmost care to return such manuscripts as promptly as possible. Photographs illustrating accepted articles will be returned if desired.*

VOL. IX. JANUARY, 1923. No. 94.

1922.

DESPITE a year's bad trade, which, of course, re-acted directly on telephone development, a fairly satisfactory increase in the number of stations in operation in Great Britain and Ireland was attained in 1922. At the end of 1921 the total number of telephone in the Kingdom was 997,805 ; at the end of 1922, as nearly as we can estimate, writing in the middle of December without complete official returns before us, the total should be about 1,057,800, or an increase of almost exactly 60,000 for the year. Of this total 1,022,000 are connected with the Post Office system, about 19,000 with that of the Irish Free State, and about 17,800 with those of Hull and Guernsey. The increase in 1921 over 1920 was only about 11,000, so that we have to congratulate ourselves on a very noticeable improvement in the rate of increase.

There are expectations that next year will see an improvement in trade conditions and we may look for an increase in the number of telephones installed which will surpass that of 1922. Many large schemes which were delayed by the War are now nearing completion, and it will be possible to join up new subscribers more rapidly. We expect an increase in the number of telephones in 1923 of at least 75,000.

The year has been marked by the opening of new exchanges in many important towns whose needs had outgrown the accommodation of the existing exchanges, notably Tottenham, Sidcup, Barnet, Maryland (Stratford), Wembley and Maida Vale in the London District, and Ramsgate, Canterbury, Aldershot, St. Albans, Bolton, Fleetwood (automatic), Dunfermline, Falkirk, Inverness, Guildford, Ascot, Stroud, Winchester, and several others in the provinces.

Great progress has been made with the main underground trunk system, of which, in addition to a number of shorter lengths, the principal extensions completed are those between London and Manchester, London and Ipswich, whilst the second London—Brighton cable is practically ready for use.

The development of the rural party line system is proceeding at the rate of about 300 stations a month, and the total number in the country had doubled itself during the year by the end of October last. The increase in the number of rural call offices, extending the telephone service in each case to some small village remote from busy towns, was over 400 for the year.

Some 50 exchanges serving new districts, had, up to the time of writing, been opened in London and in country towns, of which 27 were in England (6 of them in Norfolk), 4 in Wales, 15 in Scotland (3 in Wigtownshire and 3 in Aberdeenshire) and 4 in Ireland. Few places of any importance are without the telephone nowadays, consequently not many well-known towns figure in the list, except perhaps Thurso and Didcot. The only county towns in Great Britain at present without a telephone exchange are Kirkwall and Dornoch, and possibly the coming year may see them in the enjoyment of a service.

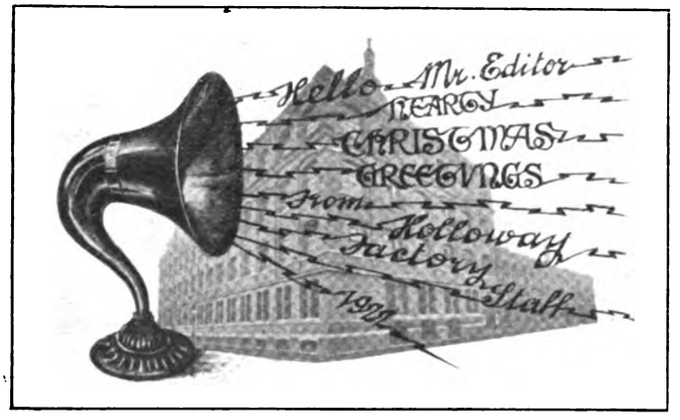
As our readers are aware, the laying of a telephone cable to Holland was completed in the summer, and Amsterdam, Rotterdam and the Hague were placed in communication with London. Three circuits are now working between the two countries, and the service has been extended to places on the further side of Holland such as Nijwegen, Leuwarden and Groningen. Negotiations have already been concluded with the Netherlands for the provision of an additional cable, and furthermore a third cable to Belgium is expected to be provided next summer.

As regards the inland telegraph service, the past year has not been without its disappointments in that the gradual decline of telegraph traffic which has been evident for two or three years past has not been arrested. Still, there is comfort in the fact that the decrease as compared with last year is comparatively small, and we have some reason for hoping that the turning in the lane is not far off. But the year has been far from being a disappointing one in other respects. It has, in fact, been a markedly successful one as regards improvements in the machinery and methods of the service, and the Telegraph Service is ready to face the increase of traffic, which, it is hoped, will come in the near future, better equipped in every way than it has ever been in the past. Foreign telegraphs have steadily improved in quality of service, and have held their own in the competition with rival bodies. The wireless to Rome has been inaugurated as a duplex ; services are working by wireless to Amsterdam, Posen, Cologne and Halifax (Nova Scotia) ; the Imperial Cable route has seen the addition of a second cable. Altogether this aspect of the Telegraph Service has developed steadily to meet the more complex commercial and social needs of the time.

There has been also during the past year an extraordinary development in the public interest in wireless due to the introduction of broadcasting as a means of private entertainment. At the time

Digitized by Google

of writing there is no evidence that the boom has yet even reached its height and we shall watch progress in the new year with interest. One of the most important possibilities is the increased interest in the art of wireless which the boom is imparting to the coming generation and so far that is all to the good.



HIC ET UBIQUE.

THE following letter addressed by Mr. Robbins of the Press Association to Mr. A. R. Kidner, the Assistant Secretary in charge of Telephones, is an interesting tribute to the efficient service rendered by his Department during the recent General Election :—

DEAR SIR,—Let me put on record our high appreciation of the efforts made by the Post Office Telephones Department to serve us in connexion with the results of the General Election. As you may be aware, we organised a Service of Results in conjunction with the Exchange Telegraph Company, and the reports which we have received from our centres express great satisfaction with the facilities which were provided for them by the Department. I am informed that the lines were connected punctually at the times they were required between our centres—Birmingham, Nottingham, Manchester, Bristol, &c.—and also from the centres to the various newspaper offices; and we were allowed to hold them indefinitely until we announced that they were no longer required. We desire to thank the heads of Departments and the staff for this very efficient service.

We refer to the part played by the Telegraph Department elsewhere.

WE have received the following original Christmas card from the staff of the Holloway Factory, Post Office Stores Dept. :—

We take the opportunity of wishing all our readers a very Happy Christmas and prosperous New Year.

A MINNEAPOLIS attorney, Mr. George S. Grimes, has secured a verdict of £200 damages from a jury consisting of seven women and five men for losses sustained through inefficiency of telephone service. He sued for £600 for time lost between 1917 and 1920 in getting wrong numbers, waiting for "central," and answering calls not intended for him.

The North-Western Bell Telephone Company is appealing against the verdict on the ground that it is not liable for damages when it gives as good a service as it can in the circumstances. The only fly in the ointment, from the Press point of view, is that the damages were given against a commercial company, and an American one at that, instead of a Government Department. At least one English paper breaks out into apologies for the company and assures us that things in America are not so bad as would appear. Greater sensitiveness to shortcomings, we are told, exists in that country than here. Personally, we do not think the case reflects so much on the service in America as on the vagaries of the law. As to sensitiveness, all people in all countries are very sensitive to wrongs which can be compensated by heavy damages.

WE tamely drew attention a month or so ago to the fact that a new exchange had been opened at Ramsgate: but we are afraid we have only half learned our trade. Two Kentish journals recorded the event, one with the heading, "'Number please, girls' visited," and the other with "Hullo-Girls' new Home."

THE first exchange in New York worked by machine switching, "Pennsylvania," was opened on Oct. 16 last. 1,741 lines were involved in the change-over and 8,853 stations. Of these 1,088 are on individual lines and 7,765 are served through private branch exchanges. A regular campaign for the instruction of subscribers and P.B.X. attendants in the use of the automatic system was undertaken before the opening of the exchange, 1,477 individuals in all receiving instruction. Modification of 55 local and toll manual exchanges was necessary in order to render them able to co-operate with the automatic exchange, and 580 operators and supervisors were taught the new method of handling the dials. 15 "A" telephonists are retained at Pennsylvania to handle toll and special calls, 25 "B" telephonists to deal with incoming calls from manual exchanges.

A GOOD deal of disparaging criticism has been levelled at the rural telephone development of this country; but from a return recently issued, it appears that out of 1,005,773 telephone stations existing at the end of September last, 48,527 were connected with rural exchanges. Few people have an accurate idea of the small ratio which the rural bears to the urban population. In England and Wales, for example, over 30,000,000 of the population dwells in urban areas and only 7,850,000 in rural districts.

WHITLEYISM AND CONTROL*

BY MR. J. W. BOWEN (*General Secretary, Union of Post Office Workers*).

WHILE there is a widespread desire that the workers in a given industry should assume control, not necessarily in their own personal interests only, but for the general benefit of the consumer and community, it cannot be claimed that Whitleyism as practised, and control as desired, are synonymous terms; advocates of the latter see advantages in the former, which are likely to afford opportunities of such development as will lead to a much clearer view of the power of control than is just now possible.

We can, however, profitably examine the present position, and consider what practical value has accrued by the establishment of Whitley Councils, what are their weaknesses, and what is immediately practical to meet in greater measure what I consider to be the legitimate demand of millions of workers for a much larger share in the management of the industries which their labours maintain. For this purpose it is necessary to note the circumstances which led to the formation of Industrial Councils which afterwards took the name of the present Speaker of the House of Commons, the Rt. Hon. J. H. Whitley. He presided over a Committee set up by the Government which reported in March, 1917.

The necessity for reconstruction after the War gave rise to much anxiety in the minds of those engaged in industry. War time relations between employers and employed were often strained, and there were numerous disputes. Practices of dilution, variation of agreements, suspension of Trade Union principles in workshops, substitution of men by women and a variety of other difficulties, all had their disturbing effects. The rise of prices and the tardy and inadequate rise of wages to meet economic difficulties of the workers, all bred resentment against many captains of industry who were known to profit considerably at a time when the nation was experiencing unparallelled trial and affliction. There was no lack of condemnation of such bodies of men as now and then threw off the choking grip of those who, by accident, or by custom or what is worse, by tradition, had found themselves in places of authority and who exercised, with more force than good judgment, the power they possessed over the workpeople. The latter awoke to a

* Address given to the Post Office Telephone and Telegraph Society of London, on Nov. 20, 1922.

Digitized by Google

sense of their own economic power, and this found its reflex in the minds of the men who later returned from the War. This mentality might easily have led to very serious national difficulties; fortunately, this was realised by the Government and by courageous representatives of the workers who devoted long and anxious periods of time to arrive at some solution of the nation's post-war industrial difficulties.

There was at that time a general recognition of the need for machinery :—

(*a*) To restore men to industry.

(*b*) To encourage good relationship with a view to reconstruction.

(*c*) To meet the demand for more recognition of the workers' interest in industry.

(*d*) To allay the industrial unrest and prevent stoppages.

(*e*) To provide for the need for consultation between the Government and chosen representatives of employers and workmen on vital questions concerning industries most affected by war conditions.

The task of examination of these questions was entrusted to the Committee presided over by Mr. Whitley which included such well-known men and women as Sir G. Carter, Chairman of the Shipbuilding Employers' Federation, Professor S. J. Chapman, Professor of Political Economy, Manchester University, Sir Gilbert Houghton, Chairman L. & N. W. Railway, Mr. J. R. Clynes, M.P., Mr. J. A. Hobson, Miss Susan Lawrence, L.C.C. Women's T.A. League, Mr. J. J. Mallon, Secretary National Anti-Sweating League and Warden of Toynbee Hall, Sir Thos. Radcliffe Ellis, Secretary, Mining Association of Britain, Mr. Robert Smillie, Mr. Allan Smith, Chairman, Engineering Employers' Federation, Miss Mona Watson, N.H.I. Commissioner.

Their terms of reference were :—

(1) To make and consider suggestions for securing a permanent improvement in the relations between employers and workmen.

(2) To recommend means for securing that industrial conditions affecting the relations between employers and workmen shall be systematically reviewed by those concerned with a view to improving conditions in the future.

It was reported in a Government publication that the Committee found that the best way to deal with the first point was to settle the second; they recommended "means," &c., as the best way of "securing permanent improvement, &c."

Their proposals were to create Joint Standing Industrial Councils :—

(*a*) *As Joint Councils*: to bring employers and workers together.

(*b*) *As Standing Councils*: to ensure regular meetings for discussion of matters of common interest.

(*c*) *As Industrial Councils*: they would throw into relief questions concerning each industry; as a whole, foster a common feeling for the industry, and help both sides to realise the social importance of the industry as distinct from their private interest.

Further, to produce an atmosphere in which disputes, when they arise, could be settled by an appeal to reason before feeling could be excited. To reduce mutual misunderstanding and unnecessary suspicion to a minimum.

The structure of such Councils was to be (1) National (2) District, and (3) Works or Office Committees.

The relative importance of these Councils or Committees would vary in industries.

Mining and cotton industries as compared with the Post Office or Railway systems would produce different machinery, but the principle in operation was to be the same.

The functions of the Councils were to be on broad lines, embracing questions on remuneration, regularisation of employment, industrial training, utilisation of inventions, industrial research, legislation affecting workshop conditions—all of which were formerly left, in the main, to the employers. There was the very important proviso of the recognition of organisation on both sides and Trade Unionism was encouraged.

The Government's attitude was expressed in a sentence :—"One organisation should speak with one voice when the Government wishes to ascertain needs and opinions."

The Government adopted the report and issued an invitation to industries of the country to organise themselves in this way for their own benefit and *for the benefit of the country.*

Criticisms of the scheme were to be expected. Some employers declared it would be the means of causing more trouble than ever. It would be the medium of complaints from one side.

Employers' initiative would be hampered.

I am reminded of a Postmaster who once told me that Post Office organisations actually encouraged complaints; without them, there would be very few, if any troubles.

Some labour leaders said it would provide merely consultative bodies without power. It would be too slow and would rob trade unions of effective speed. It would be an entangling alliance and it would be the recognition of a permanent place for Capitalism.

To these criticisms there is the simple reply that very much depends upon the constitutions agreed upon for the various bodies concerned.

Many Councils are in operation, and even allowing for present abnormal conditions, much good has resulted as shown in the decline of disputes and strikes. This effect will be beneficial all round and the organisation of labour can claim a large share in producing it.

Without organisation, a workman's trouble is seldom settled satisfactorily to himself. He usually fails to get to his employer and an argument with his foreman *has only one end.*

Contrary to the much cherished idea in the minds of prejudiced people a labour leader's job is more that of settling disputes than of provoking strikes. He is paid not so much to foment agitation as to watch, protect and advise his members, and in this capacity has ample opportunity of seeing movements which give him an insight into the industry in which he is engaged quicker and more clearly than is realised by many other responsible persons; certainly his position is better for the purpose of judgment and the exercise of initiative than the worker who might fear the wrath of his employer or superior officer.

Trades Unions so equipped function on Whitley Councils with marked effect. With such Councils operating satisfactorily and on broad lines, there is less fear of the breaking of agreements. This enables Trade Unions to devote more time to constructive effort in the industry and employers benefit by more freedom for trading.

These remarks apply, in the main, to wage questions. On general conditions of labour there is enlarged scope for Whitley Committees which has not yet been fully utilised.

But this means that the power of such Committees should be more determined. Councils which are merely advisory are non-effective. The refusal of the National Joint Committee of the Civil Service to accept the report of the Committee presided over by Sir Thomas Heath and which offered no more than opportunities to express opinions was due to a recognition of the futility of allowing *one side* to have complete power.

To give the workers' representatives only an opportunity to offer suggestions, or to exhaust their indignation over grievances, real or imaginary, to receive such representations with studied contempt, or to reply with a reticence slightly modified by the adoption of a patronising attitude on the part of the employer is neither considerate nor honest. Such a condition of affairs will simply lead to further difficulties, more bitterness and a decline of interest in the industry on the part of the worker, a result which every well-wishing reformer must deplore.

It is, therefore, highly desirable that our Whitley Councils should so operate as to encourage the maximum of confidence in them and that their power of decision should increase, not decrease. Employers can reasonably be expected to bear in mind that without the labour of the worker their own position would be untenable. A policy of opposition or of stupid "stonewalling" will not help in the development of the Whitley spirit. Distrust or fear of ultimate control by democracy will not avail employers or their representatives in consideration of matters relegated to Whitley Committees.

A study of our Councils should be from the point of view that they can accept more and more responsibility, not merely for the improvement of relations between employer and the employed, but as a means of securing such improvement in the industry as will lead to more efficiency in the general interest of the community. I want that to apply in goodly measure to our National and Post Office Whitley Councils.

It is interesting to note that the constitution of a Council covering the industry of Messrs. Rowntree, York, dated 1917 has this clause :—

> "No decision of the Councils, either sectional or departmental, will take effect until confirmed by a Director."

I admit I cannot understand why a director could not be a member of the Council to take first hand responsibility for the Directorate before decisions are reached.

Similarly, our own national and departmental constitutions are notably weak in so far as a veto might be applied to any agreement reached and this "in recognition of the overriding power of Parliament."

While I am prepared fully to recognise and support any claim that Parliament is all powerful, I find it difficult to reconcile the claims of the late Government in this matter with the attitude and policy they pursued on a number of other questions of national importance. Take the recent case of the Eastern trouble, when the lives of thousands of our fellow-countrymen were endangered and millions of pounds spent from the national purse; *all without consulting Parliament.*

Our national and departmental Councils have functioned for three years, and while one can point to many important matters which have been settled by agreement, it is a matter for grave concern that the will of Parliament has been so interpreted by the Government as to lead to their making a radical change in our machinery by the scrapping of the Civil Service Arbitration Board. This was done without consultation with the staff side, and no redress has been obtained although strong protests have been made by the staff side representatives. I regard this as a serious and unwarranted interference with our Whitley machinery, coming badly from men who at one time were much concerned with the need for conciliation. I claim that damage must be repaired before the machine can be regarded as reliable and satisfactory. The official statement that the presence of an Arbitration Board prevents agreements being reached is a travesty of the actual facts. The alternative of executive action in certain cases where the staff side cannot accept an official proposal, which has already been put into operation, is a reactionary step which all those responsible for the creation of the Whitely

Digitized by Google

Councils view with apprehension. I hope the new Government can be brought to realise the seriousness of the position.

The very carefully drafted formula expressing the position of the Government in regard to the power of Parliament is worthy of repetition here :—

> "While the acceptance by the Government of the Whitley system as regards the Civil Service implies an intention to make the fullest possible use of Whitley procedure, the Government has not surrendered, and cannot surrender its liberty of action in the exercise of its authority, and the discharge of its responsibilities in the public interest."

But the inconsistency of this by contrast with other actions of the Government stands out with striking clarity. They have accepted the principle of arbitration in the formation of the League of Nations. They agree to the reference of certain questions for judgment by Law Lords. There should be no real difficulty of referring industrial disputes between the Government as employers and their employees to an impartial tribunal. To be frightened by prejudiced critics in the House of Commons is not recognising constitutional authority so much as yielding to despotism of the most truculent character.

It is hardly to be expected that any body, be it a Government, a Civil Service, or a Trade Union organisation, will be infallible in all its judgments. It is not human always to expect love and kisses in a Whitley Council, however amorous and peaceable it may be. I think, then, it is at least sensible that in order to remove suspicions, and to promote the fullest possible desire for settlements without friction, when serious disagreement arises on important questions such questions should be referred to Arbitration if desired. That is the essence of conciliation in industrial disputes. It is "an appeal to reason before feeling has been excited."

In taking stock of the results of three years of Whitleyism in the Civil Service, and particularly in the Post Office, I want frankly to say that I see an improvement in the relations between employers as represented by the higher officials and the employees. The recognition now given to employees' representatives is without limit in that capacity. I, personally, receive the fullest consideration, and the most courteous attention on the part of the Secretariat as well as all other representatives of the official side. I very much appreciate this as an indication of the desire of the official side to fully understand the views of those for whom we work. There has been a thaw of the old official iciness. The traditional reserve of the one time bureaucratic mind has gone and we can now get discussions which permit the fullest possible expression of opinion on both sides. I go further and say that while we on the staff side have had many disappointments and not a few disillusions, it can be recorded in favour of the spirit of Whitleyism that many good results have followed the efforts we have made in tackling many important subjects. Decisions have been reached on matters which have awaited consideration for a long time, and discussions continue on others, which I trust will lead to settlements satisfactory to the staff side, which naturally I hope for, but I further desire that such settlements shall prove advantageous to the Department and to the public which we are proud to serve. Included in these matters are such important questions as wages, bonus, re-organisation of the clerical classes, hours, future education, promotion, discipline, classification, sorting standards, telegraph standards, development of the Service, &c., &c.

On the other hand, I could refer with a good deal of uneasiness to disagreements which appear to indicate the disinclination of the official side to move too fast. A traditional tranquillity is more than disturbing to a spirit still full of political prowess after fighting and failing at two elections. I could refer at length to the power of the Treasury, the unbending, uncompromising opposition, to proposals for improvement on the ground of cost, the insuperable difficulty of argument when there is a firm hand on a clasped purse, but I resist the temptation. I can, however, feelingly deplore the decision of the Treasury to apply wage cuts after disagreement with the staff side, and their refusal to go to arbitration; but as I have already referred to this principle at some length, I need not pursue the matter further now.

We are entitled to claim that the strengthening and development of organisation on the staff side has been an important factor in the progress of Whitleyism in that representatives are able to speak in a larger corporate capacity and with the fulness of knowledge and experience which the organisations have been able to apply to a study of conditions of labour in the Service and to the more complete recognition of the needs of the Service itself. The more thorough the preparation of the staff side is, the more competent is it to meet the official side on equal terms, and in proportion to the development and concentration of the sections comprising the staff side will the ability of the latter be more and more demonstrated, not only to win concessions from the official side, but also to become real guides to, and directors of public policy. The experience gained in this connexion has been most valuable, and its worth has become very marked in those who have shared in consideration of problems dealt with by the Councils, or by their many Sub-Committees.

In so far as these activities indicate progress in part control we can view them with a good deal of satisfaction; they demonstrate the capacity of the staff side for greater responsibilities.

The staff side has not used the Post Office Council "only as a vehicle for complaints." Constructive efforts have produced some most useful results. But there are recurring complaints of the limited scope of Committee work. The limitations of office Committees and the restrictions imposed upon Postmasters and other Departmental heads call for revision if the Whitley machine is to function with greater utility.

A wider devolution of local authority would, I feel sure, make for closer interest in the work of the service. Local discussions would be more free and decisions could be made earlier.

The official fear of development on the part of the staff is quite natural, having regard to the traditional distrust of movements from the bottom; but the evidence of a Trade Union official speaking of the Bourneville scheme may be useful in showing that such distrust is not justified. He said: "The question of output has been one of mutual concern. Through development of the suggestion scheme workers are as desirous as the technicians of improving methods. The health of the factory has improved, avoiding loss to both firm and workers alike. Discipline is increasingly becoming a matter of mutual concern, and the habit on the part of the worker of accepting responsibility is spreading. There has been an outburst of new life in the works' activities." Similarly, the acceptance by the Post Office man and woman of larger responsibilities would lead to improvements in the Service, but there should be departmental recognition of the improved worth of the worker.

Depression in trade has, unfortunately, lessened the power of Trade Unionism in outside industries, and employers, who, when they were threatened by a revolution, hastened to accept means of conciliation, are, to-day, intent upon exertion of their own power which cannot but have a boomerang effect in the near future. I hope the new Government will recognise this and encourage further development of the principle accepted by many of their representatives in the late Government :—

> "To meet the demand for more recognition of the workers' interest in industry."

They can do this best by setting an example in the Post Office and the General Civil Service.

Our Whitley Scheme is not perfect. I am frankly disappointed with the limitations of the present system and the restrictions imposed upon the staff. It is not a final solution in regard to the position of the workers, but time and experience will bring improvements. A larger share of control is imperative to future peace and progress, but while that is being secured I believe that the development of the policy of control of industry by the workers will be a matter of evolution. For my own part I am willing and ready to help in speeding up that process.

In acceptance of the *principle of control*, there will be many theories as to the most practical steps to achieve the objects. The Post Office as a Guild is a proposal presenting many features of real practical worth. Other theorists point to the Douglas analysis and capitalisation of the nation as a principle, which would affect all industries and include the Post Office in its scope.

State Socialism or a Co-operative Commonwealth with the motive of social service rather than personal gain, also provides interesting studies, but above all, I claim we must have such a system as will provide for the workless. Whitley schemes do not fully take to account that fatal defect in our social life. The Government, and our Civil Service Departments, are not exempt from a charge of neglect in this connexion.

The prospect of a broad system of control by workers is fair. Questions which arise as to a concise definition of the word "control" should not prevent recognition of the right, and the desirability of workers having a larger and larger share in the management and control of the machines for which they supply the power; but there is need for more and more education and organisation, need for greater development of the brain power and energy which are now allowed to remain latent in many of our services, a task which can be undertaken by Whitley Councils. I shall be greatly dissatisfied with any Whitley schemes that do not promote activity of the "Whitley" spirit, and which do not provide for the salvation of the industrial soul.

With the stimulation of interest in craft and the condemnation of craftiness; with goodwill and faith in humanity, we can safely encourage the well-ordered evolutionary progress of government of industry by the people who, in the future, will be concerned less with profit and more with the real prosperity of the Nation as a whole.

I think "Whitley" is a helpful step in that direction; we must add to its strength and efficiency by unremitting attention to its machine. Small efforts need not be despised, but we have now sufficient experience to warrant our going much further, in that I am much encouraged by helpful words of the late Rev. Silvester Horne, who once said :—

> "The law of progress is the law of losing your present gain for a larger gain that lies beyond. That is the law of progress, that when you have with great effort, and struggle, and hardship, gained your summit, you should lose it for the summit there is beyond."

OBITUARY.

WE regret to record the death of Mrs. Waite, the wife of the District Manager of Telephones, Cardiff, after a long illness. Much sympathy is felt for Mr. B. Waite and his daughter in their bereavement. Evidence of respect in which the deceased was held was shown when the funeral took place at Penarth. A large number of friends were present, including representatives from the various departments of the Post Office.

SUGGESTIONS TOWARDS THE IMPROVEMENT OF THE SERVICE.

BY MISS J. M. DALLEY (*London Telephone Service*).

IT is with some trepidation that one ventures to write upon such a subject as the heading of this paper indicates, knowing that there are so many officials whose duty, wholly or partly, consists of probing into all the questions and difficulties which arise in the Telephone Service with a view to future improvement; it is difficult indeed to convince oneself that any suggestion herein given can be of any value. In all probability the points set out in this paper have already been discussed, but no originality is claimed for them. It is only hoped that perhaps a new view may be given in favour of the adoption of the various points herein raised, which may ultimately lead to a practical application.

At the present time when changes are all about us, when new ideas and methods are constantly replacing those which have grown with us and which we are loath to part with, it behoves us to bear in mind that progress along any line brings change in its train, and old ideas and methods must be set aside if true progress is to be made.

In the Telephone Service which has been so heavily criticised recently there must be room for improvement and advancement in more than one direction, and it is necessary that all officers of that Service should carefully scrutinise all possible points, with a view to improving the Service generally.

We all know that from the most insignificant beginnings have sprung some of the most wonderful of our inventions and concerns. Therefore, it behoves us all to maintain a critical attitude towards our particular duties, considering no point too small or unimportant to be worthy of examination.

With regard to the following points which I am bringing forward for your consideration, it is proposed to divide them into two sections, dealing first with those suggestions which affect the actual operating, and secondly with those affecting the Service generally.

The first suggestion is one which would, if adopted, prove of great value to the "A" telephonist, but depends entirely upon the engineering aspect of the question. As I cannot pretend to a knowledge of engineering difficulties I will but explain the point in question with regard to its value to "A" operating. The "A" telephonist when one call overlaps another is often hindered in completing the second call by having to test the junction allotted for the first call, the speaking key of the second call having to be placed in a normal position before the telephonist can enter circuit on the first call and establish the connexion by testing and picking up the junction allotted. The necessity for the testing of junctions before connecting is understood, when one's attention is repeatedly drawn to the number of cases of a third subscriber being connected, which is undoubtedly due to the failure of the "A" telephonist to test correctly the junctions allotted. It is suggested that the "A" positions in an exchange should be so constructed that the telephonist should be able to test all lines and junctions with her speaking key in a normal position. All incoming junction positions and signal junction positions are so constructed and a great saving of time and errors would be the result if such a method could be introduced on "A" positions.

The "nine" panel multiple is a big grievance to the "B" telephonist, and contributes largely to the wrong number trouble, to the mishandling of cords, and is often the cause of a third subscriber being connected. The greater the number of telephonists concerned in one connexion the greater the chance of error. To the average telephonist the "nine" panel multiple is too wide a stretch, and the idea that the adjacent telephonist can help to connect and disconnect has proved a fallacy. It is often impossible for a "B" telephonist to wait for the adjacent telephonist to complete a connexion, with the result that the telephonist makes a frantic dive for the number, and often, due either to the distance, when the "fives" marking is not so visible, or to the confusion of cords, a wrong number is connected, or more annoying still to the subscriber, the plug has not been pushed home, with the result that the called subscriber receives a ring, but is unable to make himself heard.

Regarding the mishandling of cords, the "B" telephonist with most of her cords in use, will often allot a junction on which a "clear" is given before disconnexion from the multiple is made, in which case, if the cord is out-of-reach, and the adjacent telephonist is too busy to attend, the junction is often cleared by a violent pull of the cord, instead of the correct clearing by handling the plug only. Also, on a keyless ringing position, the picking up of a junction before disconnexion from the previous call, rings the subscriber connected, thus causing the subscriber to complain of receiving a ring and being advised "not wanted." When the adjacent telephonist is available to connect a required number which is out of reach, possibly, before the connexion can be completed, her own position is requiring her attention, with the result that a hurried connexion is made, often resulting in an engaged line being taken, as the engaged test cannot be detected if the connexion is made too rapidly.

The foregoing reasons are those concerning the disadvantage of the "Nine" panel multiple in its relation to the service given to subscribers; there is also the telephonist's point of view, which is, that excessive stretching is most injurious to health, not to mention injury to wearing apparel.

The above reasons, I consider, are sufficient proof against the introduction of further "nine" panel multiples in exchanges, and a big improvement in the Service could, I am sure, be effected, if those in use could be altered. As that is impossible, I strongly urge that an "eight" panel multiple should be considered the widest stretch of multiple which can be correctly worked by the telephonists.

The testing of distant exchange junctions used on a "no reply" call, which matures later.

The duty of testing junctions in the above case rests at present with an officer at the Information Desk. This duty could be performed with better result, if tested by an operator from the same strip of the junction multiple as was used for the original call. The monitor, when testing junctions, has to test *via* the "A" telephonist, and uses whichever junction to the "A" telephonist is clear, or most easy of access; therefore, if there should be a fault in that section of the multiple used for the original call, it is impossible that it should come to light, unless the monitor's circuit should happen to terminate on the same position as that of the subscriber disputing the "no reply" call, which case would happen only very rarely.

I suggest that all junctions requiring to be tested, should be tested from the position from which the call was originally passed, and not from the Information Desk, to ensure a more complete test, and to remove all doubt of the possibility of a "one section" fault existing.

The further suggestions I have to offer are such as would tend to a smoother working of an exchange, but do not concern the actual operating procedure.

Firstly, I would like to suggest that a simplified copy of Traffic Instructions could be compiled. All senior telephonists and supervisors have grappled with those existing, and no doubt have won in the end, after wandering through a maze of repetitions and technicalities which are confusing in the extreme to the novice. I do not wish to cast any reflections on those who are responsible for the Traffic Instructions now existing, on the contrary, I am quite ready to admit that they are most admirably put together, and no doubt serve the purpose for which they are issued. But I wonder if those responsible have ever seen some of the notes taken by the supervisors-on-probation and senior telephonists on the Traffic Instructions? Concise, is hardly the word for these notes. To see pages of a Traffic-Instruction cut down to one small sheet, is more than startling, and yet the gist of the matter is there. I do not think these notes would satisfy all concerned, but I would like to suggest that a happy medium might be struck, and the Traffic Instructions necessary be issued in a more simplified form.

The local observations are a subject of much dissatisfaction to some telephonists. These observations are not brought home to individual telephonists, but concern a section collectively. If the observations of a section happen to be above criticism, well and good, few comments are heard from the telephonists, but let there be one or more irregularities, and the section as a whole blamed for them—the comments *then* heard show a vast amount of dissatisfaction.

Is it not possible for the praise or blame, arising from local observations, to be borne by the telephonist responsible? There is much satisfaction and impetus to further good efforts in receiving praise when due, and also censure when necessary has its salutary effect. The supervisors of the sections also, would feel a greater satisfaction in knowing the telephonists responsible for the good or bad results of the local observations, and could deal accordingly, with much better result than at present.

The diversity of working at exchanges is a point which could be discussed with advantage to the Service. The few items under this heading have come to notice during periods spent at three exchanges, and no doubt could be well supplemented if other exchanges added their quota.

One of the most prominent features under this heading is the keeping of a "carried over" record of faults on exchange apparatus. A "carried over" list of faults on subscribers' circuits and on junctions is kept by the testing telephonist in all exchanges, and is considered necessary for the clearing of these faults. It should be just as necessary that the unregistered exchange faults should also be carried forward each day until satisfactorily dealt with. This would tend to a more prompt clearing of faults, which is absolutely necessary if the telephonist is to work without hindrance. This "carried over" list of unregistered exchange faults is a complete success at one exchange, and would give satisfaction to telephonists and supervisors alike if introduced in others.

The marking of the "fives" in the multiple is also different in exchanges. In one exchange the "fives" will be marked by a double row of white dots, one row on the left hand, and the other on the right-hand side of the "five" jack. In another exchange the "fives" will be marked by one row of white dots only on the left-hand side. This I have found to be very confusing to a telephonist transferred from one type of exchange to the other, and also to telephonists loaned to other exchanges for Sunday duty. This difference of marking has been repeatedly the cause of wrong numbers being connected. If the marking could be made uniform, I feel sure an appreciable drop in subscribers' complaints would result.

Another difference in practice existing, is the coupling of a telephonist's duty with a position number, which means that a telephonist allotted a certain duty is responsible for the position which is attached to the duty. This practice is weak in working, telephonists having to be moved continually to avoid those of the same seniority sitting next each other. At other exchanges the Duty-Chart is made out irrespective of position numbers, and the telephonists follow a rota which is based on the number of telephonists required in the section, the sectional supervisor being responsible for the placing of the telephonists in the various positions. This last mentioned practice is a real help to the sectional supervisor, who knowing the individual capacity of the staff under her control, is able to place them to the advantage of the Service.

Digitized by Google

A further practice worthy of discussion is the pegging by means of paper spills of certain subscribers' circuits in the "B" multiple, where subscribers have complained of poor incoming service, or of being continually called in error.

When a telephonist receives a call for any circuit so pegged, her supervisor's attention is drawn to the call; the supervisor then listens in circuit and notes the call, and any difficulty which may occur. The above procedure supplements the interception of calls on the Information Desk, and is only brought into force when all the interception circuits are in use. The call is not interrupted in any way, but if found to be an error can be quickly traced and taken up by the supervisor attending. The notes of all calls observed can be referred to whenever necessary. This practice I have only seen in use at one exchange, and is of great advantage in tracing any trouble of which the subscriber, whose circuit is so pegged, complains.

It is suggested that this method of observation could be introduced into all exchanges with advantage.

I should like to suggest that these minor points be fully discussed with regard to their adaptability for general application.

I now come to my last point—the equipment of the Information Desk.

The Information Desk is equipped with a smaller amount of apparatus than an "A" position, and is considered an economical way of dealing with irregular calls, thus leaving the telephonist free to take a higher load of straightforward calls. Such is the explanation given, in Traffic Instructions, Division E, Section E3, for the "Introduction of Monitors, and the Information Desk." Also in the same instruction one reads the following:

> "Monitors come into immediate communication with subscribers who are in difficulty with their telephone service. It is therefore essential that a monitor should be able to grasp promptly the nature of such difficulties, and to appreciate, from the subscriber's point of view, the annoyances caused thereby. She must be business-like, resourceful, tactful and able to convince the subscriber that he is talking to someone in authority, who is able and anxious to help him."

After reading the foregoing, anyone unaware of the limited facilities of the Information Desk, would consider that everything possible has been provided to help the monitor to satisfy the subscribers with whom she comes in contact, instead of which the equipment supplied to enable a monitor to satisfy subscribers is limited in the extreme.

I wish it to be clearly understood that I am referring principally to the monitor who deals with subscribers' complaints.

The subscriber who complains has usually reached the limit of his patience, which limit varies according to the type of subscriber. The best means of pacifying him or her, as the case may be, is by the speediest possible connexion to the required number. Therefore it means that the monitor's position should be equipped to this end: if anything, the position should be more fully equipped than that of the "A" telephonist. We find instead, a position devoid of the principal means of connexion, viz.:—Order wires and junctions to distant exchanges and the local multiple. Every connexion has to be made *via* an "A" operator in the case of distant exchange calls, and *via* the "B" telephonist for connexions to local numbers, which may mean, and very often does, that the monitor experiences the same difficulty as the subscriber is complaining of, thus causing a double delay, and often calls forth the remark that the supervisor is as bad as the operator.

The monitor, if trying to complete more than one call at a time, has constantly to move to and from the lines connected, until the distant exchange answers, as the supervisory signals do not act on cords connected *via* the "A" telephonist. This lack of supervisory signals is a big hindrance to the monitor, and is often the cause of long delay in completing calls, as the distant exchange supervisor often answers when the monitor is not in circuit and *vice versa*.

To the monitor who realises her responsibility toward the subscriber, who is complaining bitterly of the attention given, the Information Desk is a trial, and an obstacle in the way of giving satisfaction to the subscriber, and the constant realisation of inadequate equipment does not tend to a smooth and even-tempered performance of her duties. If the Information Desk has been so equipped for the sake of economy, surely it is a false economy, and is at the expense of giving satisfaction to subscribers, which should be the chief aim of the Service.

I would like to suggest to remedy the short-comings of theInformation Desk working, that, in all exchanges, one position at least on the Information Desk should be supplied with "order wires" and junctions to the distant exchanges, and also a local multiple. It would be found to be a big asset, as the monitor would be enabled to deal with a much heavier load, with great satisfaction both to the subscriber and herself. With regard to new exchanges this suggestion could surely be considered seriously. To most of the exchanges at present existing, the suggestion would be most difficult to apply. I should like to suggest for these exchanges, that an unused "A" position could most easily be converted into a position from which a monitor could deal with subscribers' complaints, with much benefit to the Service generally. Complaint lines could easily terminate on such a position, and all facilities would be to hand for the speedy connexion to distant exchange numbers, also the supervisory signals would act on such a position. Delay, consequent on the connexion *via* an "A" telephonist would be obviated. The call when completed should also be more satisfactory as regards hearing, as there would be at least one connexion less in the call.

Another suggestion with regard to the Information Desk working which I would like to urge, is the using of the direct lines to distant exchanges for the completion of calls on which undue delay has been experienced. These direct lines are or should be used only in cases of emergency, and are used very rarely if this rule is adhered to. I should like to suggest that when clear these lines may be used for completing calls, if by so using them the subscriber is saved further delay and annoyance.

The foregoing suggestions have been awaiting an opportunity to be presented, and I hope through the medium of this paper they may reach the officers concerned, and be considered by them in all their bearings with the knowledge that they have been brought forward in the hope that they will ultimately benefit the Service.

THE FIRST COLONIAL REPEATER STATION OF THE BRITISH POST OFFICE.

BY E. G. FURNEAUX.

ON July 1 last the British Post Office staffed its first colonial repeater station. This interesting event took place at Harbour Grace, Newfoundland, where four men from the home repeater stations relieved the Western Union staff who had been working the Muirhead Gold Wire repeaters connecting the two cables between Ballinskelligs, Ireland, and Halifax, Nova Scotia.

Early that morning a cable ship left Halifax to divert that end from the Western Union Cable hut to the Imperial. This work was completed on the following day, but in the meantime the Irish Irregular forces had declared war on the Imperial land lines between Ballinskelligs and Dublin, and communication between Halifax and TS *via* Imperial Cable No. 2 was held up indefinitely.

The cables were laid during the years 1874-76 by the Faraday, the Irish section being 1,994:17 knots in length and the Canadian section 687.96 knots, the conductor resistance of the former being 2.61 ohms per knot, and the latter 2.86 ohms. The capacity of the longer cable is 787 mfds. and that of the shorter 271.5 mfds. An average working speed of 115 l.p.m. to Halifax and 110 l.p.m. to Ballinskelligs is maintained with duplex conditions.

Harbour Grace is situated on the shores of a fine natural harbour, nearly three miles long and opening into Conception Bay. A long low rock stretching across the entrance acts as a natural breakwater and a lighthouse is situated on its northern end. The city is connected to St. John's by a railroad operated by the Reid Newfoundland Co. It is a narrow gauge single track, and the builders avoided all inclines possible with the result that the track winds in and out amongst all kinds of beautiful scenery. It creeps along the sea-shore, through miles of pine woods, skirting beautiful lakes and crossing some of the smaller ones with the wheels barely out of the water. Rushing streams and lonely swamps are all included in its itinerary. The Harbour Grace branch leaves the main cross-country line at Brigus Junction, which is about half the total distance of the 70 miles between the two cities. The trains are drawn by a typical American engine fitted with cow-catcher and searchlight. A large bell is suspended between the chimney and the footplate and this is rung when the train nears a station. The scheduled time for a trip from St. John's to Harbour Grace is 5 hours 10 minutes, but the train being a mixed freight and passenger one and time of little importance, passengers congratulate themselves if they arrive only an hour late. During the winter the trains are often snowed up for several days and the unlucky passengers either try to reach the nearest village for supplies or break open the freight. As the harbour also gets frozen over and its mouth packed with ice floes, when the severe weather is on, Harbour Grace is usually cut off from the outer world for several days each winter.

A Roman Catholic cathedral gives Harbour Grace the title of city, and the inhabitants are very proud of its designation, and newcomers get frequent reminders of its standing should they refer to it by any lesser term. Although it is the second "city," it is not now the second largest town, but ranks third as the population is diminishing. According to the 1921 census it has about 3,800 inhabitants and as trade is bad and no new industries are starting, the population is gradually drifting away. At present a large number of men are employed at the Labrador fisheries, going there

Digitized by Google

about the middle of May and returning again at the end of October. Seal and cod are the mainstays not only of Harbour Grace but of the colony, and in the past men would earn sufficient during the season to maintain themselves and families in comfort for the year. This does not apply nowadays and last winter there was considerable distress amongst the fisherfolk.

There is a seal oil factory and also two small boot factories in the city. There are a few small farms on the outskirts on which potatoes, turnips and cabbages are the main crops. Soil is very poor and stony and not much trouble is taken with the cultivation.

The post office is one of the largest buildings in the city, not only housing the postal section but also the Customs offices. The telegraph office is also in the building, but not under the control of the postmaster. Mails are received and despatched from and to St. John's once a day. On receipt of the mail bags the letters are sorted into the private boxes of the box renters. The public side of the boxes is locked, the owner keeping the key. When mail time comes a crowd gathers to await the distribution of the letters. Those who are not renters of a private box either call for their mail or wait for it to be delivered when one of the sorters and counter clerks has enough spare time to go out with such correspondence. The front of the counter is enclosed and business is done through a pigeon hole, similar to English railway booking offices. The savings bank section is totally enclosed in a large wire cage, business being transacted through a pigeon hole in the wire front. The telegraph section also does its business through a pigeon hole, which is normally closed. Customers rap on the door, obtain a form, write out their message, pay the cost, affix no stamps, have a chat with the operator-counter-clerk and depart.

The Harbour Grace—St. John's circuit being an omnibus one with eight stations on it, the operator waits his code turn and hopes none of his colleagues up the line will leave their switch over as the line is worked on the "closed circuit" system. The American Morse code is used and the apparatus is also American and of poor structure.

The Imperial Cable station is connected to the telegraph office by private telephone, over which cablegrams *via* Imperial are dealt with. Both the post and telegraph offices close for meals throughout the colony—time not being a very important factor with the Newfoundlanders.

The Anglo-American Telegraph Co. have offices in all the larger townships and secure a large share of the traffic. As they have their own lines to St. John's they are able to deal with their work expeditiously.

When Harbour Grace was originally laid out as a city it was hoped it would become the future capital and seat of government. Thanks to this hope of their forefathers, the present generation are blessed with one of the best water supplies in the colony and can also congratulate themselves on the fairly good roads in the immediate vicinity of the city. The streets have no pavements, the "side walk" being strewn with gravel and the centre is not even tar coated.

Flocks of geese, herds of goats, and a few cows wander at their own sweet will in the main streets of this decaying city of Harbour Grace.

ABERDEEN NOTES.

A meeting of the District Manager's staff was held on Friday, Nov. 24, to recognise the completion by Mr. Clow of twenty-five years' service as Chief Clerk.

Mr. Storrie, District Manager, presided, and expressed the high opinion he had formed of Mr. Clow as a man and a Chief Clerk, and, in the name of the staff, presented him with a selection of books in an oak book rack. Mr. Brodie, Contract Manager, Mr. Davidson, Assistant Traffic Superintendent, and Mr. Scott, Overseer, also spoke of Mr. Clow's popularity with all the Departments in the office.

Mr. Clow, who was completely taken by surprise, replied in a reminiscent speech, thanking the staff for their gift, which, he said, would always be one of his most cherished possessions.

Miss M. C. Longmore, Shorthand Typist, District Manager's Office, Aberdeen, was presented by the staff on Nov. 25, with a silver centre piece and silver side vases on the occasion of her approaching marriage.

"TALK OF MANY THINGS."

REFERRING to the report of the Committee of the Union of Postal Workers, in which it is alleged that Manchester telephonists often faint under the strain of the work, a London supervisor is reported as saying: "*We* don't faint, and we don't weep. We cannot speak about Manchester, of course, *but it is a terrible handicap to live in Manchester any way* . . . The London girl makes the most efficient operator."

We shall be glad to have the views of our Manchester colleagues on this somewhat controversial subject.

Up to the date of going to press, *all* the entries in the "Amusing Incident" competition have been from the Provinces. "Stands *London* where it did!" We hope to publish the names of the winners in the February JOURNAL. It is gratifying to know that our column is read by so many of our Provincial colleagues, and they are to be congratulated on the high standard of their contributions.

Might one Suggest.

Might one suggest that just for a change,
The pow'rs who aver that our load
Is all insufficient to keep us employed,
Should try for a month, say, our mode
Of whiling away the sweet dreamy day,
Plug-pushing!

Of course, each wise man should forget for a month,
The wage he deservedly earns,
And gratefully grasp on each week's golden (?) day
What is proved by the "Low Cost of Living Returns,"
Too much to ask, for so easy a task, as
Plug-pushing!

Religiously punctual they daily must be,
(They sternly demand that *we* are);
And daily must wrestle, like you, or like me,
To obtain a small space on a train, bus or car,
Punch on, and be well in their seats by the hour,
Plug-pushing!

And calmly, when shrieked at, or (whisper it low),
E'en sworn at by subs. in a rage,
They must answer politely, like so and like so,
(Little Green Books I cannot remember the page),
Which says, "Be polite," tho' your wrath's at its height,
Plug-pushing!

And patiently sit with a small key depressed,
Depressed in their spirits as well,
While feebly they try midst the yells of the rest,
To obtain a clear junction for just a short spell,
Might one suggest they'd enjoy a month's *rest*,
Plug-pushing?

J. ISOM, Victoria Exchange.

We print a reply to the verses "The Open Window"—"And the Closed"—published in last month's JOURNAL. We shall be pleased to receive the views of other sufferers—for and against.

DEAR EDITRESS,

I am not usually given to standing up for the sterner sex (except when I am obliged in the Tube of a morning); but I really have a kindred feeling for the intrepid male who found his way into our exclusive columns last month.

Fresh air, of course, is eminently desirable; but I wonder why, in the name of all that is comfortable, it cannot be administered without draughts. Telephonists particularly can speak most feelingly on this subject. For the most part, the matter of ventilating and heating exchanges is a dark blot on the more or less fair escutcheon of the G.P.O. It is a patch-work sort of an arrangement. In the self-same exchange, some people will be dying of suffocation whilst neighbouring colleagues will be dying of exposure. For

Digitized by Google

my part I prefer suffocation—it s quicker and does not have to be assisted by mustard plasters and linseed poultices. Moreover, when one is harnessed to a certain position, with a draught playing with one's hair like a typhoon over the pampas, one cannot take one's work and retire to a sheltered corner —it just *has* to be endured—ugh ! I am resolved—if ever I am rich, or if I earn my marriage gratuity before the various Councils and Commissions decide that I really owe *them* a trifle instead, I shall have a house built on the Thermos flask principle. Then I shall make myself warm to a comfortable degree, go right in, and stay there. After a time, I shall thus hope to counteract the frigid effects of many chilly years as a telephonist.

Yes, I am glad the intrepid male had the courage to protest—I wish him a happy and warmer New Year.

With cordial wishes for the continued success of the Telephonists' column.—Yours sincerely, STIFF NECK.

Contributions to this column should be addressed: THE EDITRESS, "Talk of Many Things," Telegraph & Telephone Journal, Secretary's Office, G.P.O. (North), London, E.C.

THE PUBLIC SERVICE.

BY H. MORGAN.

THE criticism which is from time to time heaped upon the Civil Service arises in a large measure from a mistaken impression as to its functions. It is desirable therefore to consider the principles which are essentially operative in service under His Majesty's Government and which rightly understood ensure efficiency and economy.

At the outset it is well to observe that the late war created difficulties in administration of public service never before experienced, and that the aftermath has caused confusion in the minds of the public generally as to the functions of Government Departments, and prejudice as to the commercial ability and acumen of its administrative officers as well as rank and file. This prejudice and confusion of thought has been accentuated by a Press campaign in which misrepresentation has been clearly discernible.

The organisation and methods of giving effect to Departmental requirements, *in the interest and service of the public*, must of necessity widely differ from those appertaining to purely commercial and dividend-earning establishments. In the former case the principal desideratum is to render service in the national interest, and for public benefit and welfare, commercially and otherwise—such service to be of a character in keeping with the particular Departmental activities concerned, whether revenue-earning or otherwise. In the latter, the entire effort of the establishment is made to tend towards the definite object of securing gain for those interested, the chief end being dividend.

The first principle to be observed in all Departmental activity of a Government and public character is that it is a service *to* the nation *for* the nation, and not for any particular coterie, federation, clique, or party.

Reverting, at this point to the statement set out in the second paragraph, we are able to readily comprehend the causes which have operated. Departmental procedure follows sequentially along definite lines and in accordance with well-thought out plans and operation, and although this has a tendency to stultify initiative it has proved to be eminently satisfactory, and previous to the war was held up as a pattern by a Press which was at that time vilifying private enterprise (particularly of a telephonic character) and designating it "pirate" enterprise, only, it should be stated, because the differentiation between private and public interest was not perceived or preserved.

Climacteric conditions of course necessitate emergency measures, and the public services were during the War subjected to administration partly by staff whose whole training, outlook, and perception of duty was "service" and partly by gentlemen introduced for special purposes, and with unlimited spending powers whose life training had tended solely to "commercialism."

It is doubtful whether it has yet been recognised by the public that the administration of a Government Department for the purpose of winning a war under terrible emergency is distinct and different from that required for the conduct of a similar Department when such calamitous happenings are absent, and in these circumstances the terms "profit and loss," "profligacy and parsimony," "fair-dealing and cheeseparing," "efficiency and redundancy" need to be restated and re-valued.

In all commercial enterprise and public administration "service" and "profit" are closely associated; commercially, by reason of the fact that service badly rendered, or commodities served to the purchaser in unsatisfactory or unserviceable condition, have a direct effect on sales, output, and profit; administratively, because of the very important bearing that the service rendered has upon the commercial activities and general welfare of the nation as a whole.

A public Department does not, as is erroneously supposed, exist to make profits in the ordinary dividend earning sense, and it should be evident that any profit made by it in financial transactions, apart from that of the profit of general benefit to the community, is a profit derived from the community by the community. It is clear, therefore, that the relationship of the two factors is distinctly different when viewed from the two aspects cited, and that the profit accruing to the State by reason of service efficiently rendered by its servants, cannot be computed and set-out in monetary terms in a "statement of account" or balance sheet.

It follows, therefore, that the *rendition of service* is the objective in the training of public servants, and how well this has been achieved was, it is thought, fully set forth during the period of world-wide crisis.

Nelson's famous signal is becoming like his flag, a bit threadbare, but it is nevertheless not inapplicable to the present day, and although service faithfully rendered may perchance receive somewhat tardy recognition, its punctilious and conscientious fulfilment has a full and rich reward in the personal satisfaction consequent upon duties well done and tasks successfully accomplished in the endeavour to maintain a clean and efficient public service.

CONCERNING EFFICIENCY.*

BY T. A. BECK.

EFFICIENCY of high degree is the end in view of all earnest workers no matter what their walk in life may be. The ways and means of arriving at that desirable state must of necessity vary; firstly, according to what might be called one's natural gifts; secondly, by determination to succeed backed up by honest endeavour; and thirdly, by opportunities of acquiring experience and proficiency.

It is not the rule but rather the exception, I think, for people to find themselves engaged upon a career that fulfils their early aspirations, so that for most of us much honest work is necessary before we become really efficient.

So far as the arts such as music, literature and painting are concerned it is probably true that those engaged in them are following their natural inclinations, and therefore the path to high achievement, although steep, is not strewn with the difficulties which confront those who drift into commercial or industrial pursuits. Artistic vocations seem to provide more scope for inspiration and joy of labour for its own sake than do the more mundane but nevertheless very necessary occupations. Not that the motives of those who are engaged upon the latter are purely mercenary.

Each profession or trade has its own fascinations and none more than that of telephony. The new entrant to the telephone service, particularly in the manipulative section, finds that very little of the experience which may have been gained elsewhere is of much value so far as the details of her new task are concerned. The first step, therefore, in the progress of a telephonist towards efficiency is the course of training at the schools where a thorough ground work is provided in the rudiments of the art of switching. It was not always so. It is not many years since it was the practice to send learners direct to an exchange, and they acquired the whole of their knowledge in the rough school of experience. Since it is easier for us to impart our bad habits to others than whatever good habits we possess, it was only natural that with the rapid development of the telephone system more scientific methods were evolved, with the result that the present system of training could perhaps hardly be bettered.

Assuming that the embryo telephonist has passed the successive ordeals of the process of selection, which in itself are severe, and the preliminary training, I propose to dwell for a moment on some of the qualities which one expects to find and which are necessary parts of the equipment of an efficient telephonist to be. Mention will be made of four qualities which in the opinion of the author are essentials, for ultimate efficiency depends upon the degree to which they are possessed and developed.

The first is an even temperament. In the course of a day's work the telephonist comes into touch with a multitude of people, each one making some demand upon her services. Imagine for a moment what that means. She holds conversation with a variety of persons whom it would be well nigh impossible to find collected together at any one place, so different are their interests. From first to last their emotions probably extend over the whole range of human emotions. The voices one after the other indicate success, failure; grief, joy; fury, complacency; haste, leisure; insult, courtesy; command, invitation; and so on.

Whilst the telephonist cannot be altogether disinterested in the emotion or passion in the voice of the caller which reaches her through the medium of the receiver, yet her temperament must be such that it keeps her from becoming influenced to the extent that the atmosphere of one call is permitted to disturb her treatment of another.

In one call she may be accused in no uncertain fashion of having ruined a bright and prosperous career beyond hope of redemption by failure to gain attention from a required number. On another she may be condemned to eternal torture because the subscriber required is so inconsiderate as to be making a call on his own account instead of leaving his line disengaged for the benefit of the caller.

It is not intended to give the impression that telephonists are continuously harassed at their work, but the effect of the harmless and useful telephone upon some natures is such that the flood gates of anger, sarcasm and, I fear, abuse, sometimes are opened wide, and it is the telephonist who bears the brunt of it. A very human impulse in these circumstances would be to show resentment and a desire to retaliate, but the trained telephonist refrains.

One's efficiency would suffer immediately if a sense of injustice was fostered, and it is at such times as these that an even temperament is of the utmost value in maintaining a high degree of personal efficiency. Those not fortunate in the possession of an even temperament must draw upon their measure of self control.

*From an address given to the London Telephonists' Society.

Digitized by Google

Another essential quality is agility of mind. This may sound strange to those who regard the work of a telephonist as very largely mechanical. That view is demonstrably erroneous.

There is not a movement in the handling of a telephone call that does not call for a mental decision first.

A few examples will illustrate the point. The moment a subscriber calls starts the mental process. The telephonist has to translate the lamp cap marking, of which there are commonly about 12 in use, into the class of service to which the subscriber is entitled. She has then to be prepared to sort out into proper form the number demanded by the subscriber. The name of the exchange required has to be connected to code and the position of the order wire key and junctions determined. Then the significance of glowing and darkened supervisory signals has to be determined according to the progress of the call. Similar conditions on two or more signals do not necessarily call for the same action. Sufficient has been said to show that the mind has to be constantly working at a high speed.

Agility of mind, however, would be of little use unless combined with the facility of translating rapidity of thought into equally rapid actions. Speed and precision of movement *can* be developed to a degree that become akin to the mechanical, but only if the same movement or sequence of movements are repeated.

In factories where articles of standard pattern are turned out in large numbers, it is possible so to organise the production that they pass from hand to hand, each worker performing certain functions constituting a part only of the complete process, and the work is mechanical. A telephone call cannot be handled in such a way. The telephonist handling it has to build it up from beginning to end, seeking the assistance of others when necessary, but never losing control.

The physical actions must necessarily be decided upon according to the circumstances of the moment and the most efficient telephonists are those who have developed the twin qualities, agility of mind and of action, to a high degree.

One other quality I will mention as an essential to the telephonist's vocal expression. I can imagine nothing of greater value to the telephonist than a voice capable of a wide range of expression. The quality of the voice is of course of considerable importance, but as the utterances of telephonists are mostly in the form of set phrases, the amount of expression put into them is most important.

A glance at the list of standard expressions immediately impresses one as giving wide scope for the display of flexibility of vocal expression. Many are the instances in which subscribers have expressed their appreciation of the sympathetic treatment received at the hands of the exchange staff in times of distress, and there can be no doubt that the telephonists who were concerned were able to modulate their voices according to the circumstances.

All the ordinary courtesies given and received when we meet face to face should not be abandoned when we communicate by telephone, and although shorn of the assistance of eyes, hands and facial expressions, the voice can be made to express full measure of sympathy and understanding. The fortunate possessor of a well-modulated voice must surely find her efficiency less impaired at the end of a long and trying day than does her more unfortunate colleague who lacks this important quality.

It is not without a feeling of timidity that I pass on to a brief consideration of a few of the attributes one expects to find in those who wish to climb the ladder of success.

In the first instance there must be ambition. The desire to get on ; to excel. But it must be honest. Not of the kind that seeks preferment at the expense of others, but the honest aspiration to succeed in healthy rivalry. There is a danger, I think, that unbridled ambition creates a tendency to self-aggrandisement. We tend to become blind to deficiencies which are only too obvious to others. Instead of steady endeavour there is an inclination to become crafty, and the best efforts are reserved for occasions when there is an influential audience. Such a state of mind is to be abhorred. On the other hand an ambitious person cannot afford to be timid. Self-reliance is also necessary.

There should be a quiet steady confidence in one's own powers. Tasks which may be new and strange should be tackled with a will and steadfast assurance to succeed. Doubt in our own ability courts disaster. Whilst self-reliance is a very estimable quality it has a counterfeit which is to be avoided. I refer to conceit. We so often detect it in others, but I am afraid that it is a case of having first to remove the beam from one's own eye.

There are other qualities I can only mention in passing, such as imagination, power of concentration, grasp of detail, power of controlling others, self-control, sense of humour and tact, but I would like to enlarge upon just one other. That of individuality.

Those who are employed upon work of a routine character may find it difficult to preserve their individuality, because their task seems to give them no opportunity or scope for exercising it. Unless such a person's character is strong, there is a tendency for one's individuality to become subordinate to one's surroundings instead of rising superior to them. To make such a surrender is fatal ; if we let go our individuality then with it goes initiative and originality, and we become just copies of somebody else.

We may be chagrined because others appear to be making better progress than ourselves, but they succeed because they are using their natural gifts to the best advantage. They have not thrown their personality overboard.

The greatest measure of personal efficiency is to be obtained not by imitating others, but by the full development of our own character. To mimic others is flattery to them, but a poor compliment to ourselves.

LONDON TELEPHONE SERVICE NOTES.

London Telephonists' Society.

ON Friday, Dec. 1, at the Society's third meeting of the Session, Mr. A. O. Gibbon, of the Engineer-in-Chief's Office, gave a lecture on "Wireless Telephony and Telegraphy." The lecture was a "popular" one, free from technical complications. With the aid of some very interesting lantern slides the lecturer gave a short history of the development of wireless telegraphy. The subject was led up to by a description and pictures of the Central Telegraph Office, and by reference to men of science who have been prominent in assisting to make possible the very latest scheme of "broadcasting" to our homes. The latter part of the lecture consisted of illustrated descriptions of various types of wireless apparatus. Mr. Gibbon charmed his listeners by his intimate manner, and to say that he gave a lecture scarcely describes the case. It was more like a chat by one's own fireside.

For the demonstration which followed, Messrs. Burndept, Ltd., the Wireless Engineers, of Blackheath, very kindly loaned one of their Ultra III sets. It was on one of these sets that a concert broadcasted in America had been heard in London the previous week.

Promptly at 8 o'clock the concert broadcasted from 2 L.O. (Marconi House) was picked up and was reproduced on a loud speaker, an affair like a gramophone without the works. The wonder of transmission and reception of music by wireless was well demonstrated, but it seems to be a fault with loud speaking devices that a mechanical effect is produced. In the headgear receivers the reproduction was perfect.

Mr. Gibbon misjudged his audience when he thought they had had enough by 8.45 p.m. There were unmistakable sounds of disappointment when the end of the demonstration was announced. During the evening an interesting experiment was tried of using a number of the audience as the aerial. First, a dozen or so of the ladies joined hands for this purpose, followed by a chain of the sterner sex. Hopes had begun to run high that a mixed aerial would be tried, but it was not to be.

At the conclusion a very hearty vote of thanks to Mr. Gibbon was passed for the instructive and interesting evening he had provided. In reply, Mr. Gibbon expressed his indebtedness to Mr. Read of Messrs. Burndept, Ltd., and to Mr. Winstone of the Post Office for their assistance in connexion with the apparatus.

For half-an-hour before the meeting there was music provided by Miss Gall at the piano and Messrs. Cracknell and Beck with song.

The annual dance is being held on Saturday, Dec. 30, at the Bishopsgate Institute. All the tickets were disposed of immediately the announcements were out.

The next business meeting will be on Friday, Feb. 2, when the winning competition papers will be read.

Langham Choral Society.

On Wednesday, Nov. 22, the first concert of the session was held at Queen's Hall. The performances of Coleridge-Taylor's "Tale of Old Japan" and excerpts from Berlioz's "Faust" were well up to the Society's standard of excellence. The program contained also some orchestral items and songs, two of the latter being compositions of the conductor, Mr. Hugh Marleyn.

The attendance was a fairly good one but the Hall was not sufficiently full to make the evening a success financially. The anxieties of the Committee would be much smaller if more men would join the Society. There is plenty of room too for instrumentalists of all kinds. The Hon. Secretary, Mr. W. R. Child, will be pleased to hear from vocalists and instrumentalists. They may write to him at 102, Dean Street, W.1, or better still attend at the Ranger's Hall, Chenies Street, Tottenham Court Road, any Tuesday evening at 6.30 p.m.

A popular concert in aid of the funds of the Society will be held at King George's Hall, on Thursday, Feb. 15. The tickets will be 2*s.* 4*d.* and 1*s.* 3*d.*

* * * *

A Retirement.

A familiar figure is missing from the G.P.O. South Building in the person of Mr. A. H. Stanley who retired last month. Mr. Stanley was on the staff of the Office of Works and was responsible for keeping the furniture and fittings in good order. If anything went wrong with a door or a drawer, if a window would not open or would not shut there was instant demand for "Old Stanley," as he was affectionately called. As an expression of appreciation of his never failing courtesy and consideration for the comfort of the staff a cheque for twelve guineas was sent to Mr. Stanley. Unfortunately Mr. Stanley was not well enough to attend a little reception. Here's wishing him a speedy return to vigorous health.

Western District Contract Office.

The fourth annual dinner of the Western District Contract Office was held at Pritchard's Restaurant, 79-81, Oxford Street, W.1, on Nov. 17, 1922. The District Contract Agent, Mr. W. V. Pegden, in the Chair, was supported by the following guests :— Major G. F. Preston C.B.E. (Controller, London Telephone Service), Mr. W. A. Valentine (Deputy-Controller), Mr. J. Stirling (Assistant Controller), Mr. W. Bold (Superintendent of Accounts), Mr. W. F. Taylor (Superintendent of Contracts), Mr. F. J. Phillips (Sectional Engineer, West External). A most enjoyable evening was spent and an excellent dinner was followed by a musical programme contributed by members of the staff and visitors, the artistes being Messrs. W. V Pegden, G. Pollard, T. Poland, H. G. Evans, H. Neil, W Horlock, S. W. Swain, C. F. Bradshaw, W. R. Child and F. J. Evans. A display of sleight-of-hand by Mr. J. E. Williams was also much appreciated.

Between the items the following toasts were honoured :—The King, the Western District Contract Office, the London Telephone Service, the Visitors and the Chairman. The work of the London Telephone Service during the past year, with especial reference to the Western District Contract Office, was brought under review and excellent speeches were given by Major G. F. Preston, C.B.E., Messrs. W. A. Valentine, W. F. Taylor, F. J. Phillips, W. V. Pegden, W. Glenny, and T. Poland. A very successful evening closed with the singing of "Auld Lang Syne."

Culled from the Exchanges.

Avenue Exchange.

A bazaar in aid of the London, Westminster and Shadwell Children's Hospitals, organised by the Avenue Exchange staff, was held on Saturday, Dec. 2, in the Aspland Hall, Hackney. The bazaar was opened by W. A. Valentine, Esq., and Mrs. Valentine, who were presented with a buttonhole and bouquet respectively, of red and white carnations, by little Miss Marie Rowe.

Miss Newman introduced Mr. and Mrs. Valentine in a few well-chosen words, and the announcement of a donation of £5 towards the bazaar funds from H.R.H. the Princess Mary, was received with cheers by all present. Mr. Valentine in a brief but telling speech, made reference to the splendid work done by the three hospitals and the London Children's Hospital, Shadwell, Westminster, which were to benefit by the bazaar, and concluded by commending the stalls and their contents to the notice of all prospective purchasers. A vote of thanks to Mr. and Mrs. Valentine was proposed by Miss Metcalf, and seconded by Miss Marlow (joint organisers) which was carried with acclamation.

As a result of this effort, £100 was realised, and this will be distributed as a Christmas gift to the hospitals mentioned.

Our tame poet, who on this occasion refuses to be suppressed, has perpetrated the following account of the proceedings :—

OUR BAZAAR

Thank you, dear reader, whoever you are
If you patronised our grand bazaar.
Our gratitude just overflows
Toward all who helped—especially those
Who came in such a gracious way
To officiate upon "the Day."
The stall-holders gratefully bear in mind
That their interest was of the practical kind,
For they subsequently toured the hall
And made a purchase at every stall.
Truly a wonderful show was there,
'Twas like an old-time Christmas Fair.
The prevailing colours were red and white—
Each stall with bunting and ribbons bedight.
We'd like to mention, first of all,
The artificial flower stall
Whose tinted blossoms and foliage rare
Were made by the cripples in John Groome's care
Its attendant fairies too, were decked
In chaplets of flowers, with charming effect.
The toffee-apple stall below
Stuck to its guns and made brave show,
Whilst the weighing machine just on the right
Plied a brisk trade, though out of sight.
The toy stall next entranced our eyes,
With dolls of every shape and size—
Not forgetting "Rufus the Red"
Who bore a price upon his head!
And then we came to the fancy stall
With dainty garments for boudoir and ball,
Of laces and ribbons so filmy and sweet
(To name them, I fear, would be indiscreet.)
The houp-la stall and the Christmas tree
Filled both young and old with glee;
Whilst the bran tub got us in its grip,
And we soon returned for another "dip."
The household, woollen and grocery too,
Claimed our cash as we hove in view.
And poorer, but weightier, we passed along
To the Christmas Cards, which were "going strong."
Then the fortune-teller, a gipsy bold,
Read the cards and our fate foretold.
Whilst the orchestra, to quell our fears
With strains of music charmed our ears.
From the sweet stall scarce could we break away,
For those sweets were all home-made they say,
And before our fascinated sight
Loomed marzipan fruits and Turkish delight!
To turn and flee seemed the only hope,
But the way was barred with scent and soap,
Perfumed bath salts and candle shades—
Offered for sale by beguiling maids.
The refreshment staff with its handmaids neat
Seemed to promise a safe retreat;
And the dainty teas which were served with speed,
Refreshing us in our time of need,
Were instrumental, we must confess
In making this effort a real success.
We think our Staff were simply splendid
And when their arduous day was ended
Their spirits rose by leaps and bounds
For their profits totalled one hundred pounds!!!
This good round sum will shortly drift
To hospitals, as a Christmas gift—
But the joy of giving will still remain,
To have lighted a way through the gates of pain.

Hence with a Happy New Year to all
Who helped our bazaar in the Aspland Hall.

C. A. S.

City Exchange.

The City telephonists on Friday, Dec. 1, gave a concert at St. Mary Ward Settlement in aid of St. Bartholomew's Hospital before a very appreciative audience. The items included two amusing sketches "The Soup and the Savoury" and "The Wrong Flat." Also several songs, recitations, violin and pianoforte solos were included. Not forgetting the Jazz Band which gave finesse to the concert. The amount realised was £36 1*s.* 7*d.*

* * * *

Park Exchange.

On Tuesday, Dec. 5, the staff of Park Exchange held a social and dance to raise funds to provide a Christmas Tea for the poor children of the district. A very jolly evening was spent by nearly a hundred of the staff and their friends at Shearn's Restaurant, Tottenham Court Road. Dancing was the order of the evening, but for the pleasure of the non-dancers there were musical items, recitations and competitions. A palmist was mysteriously hidden behind a screen in one corner of the hall and her clients were many and varied to judge by the long queue continuously waiting their turn to consult her. A bran tub was not the least of the evening's attractions and was well patronised by all. At 9 p.m. an interval was called and everyone adjourned to partake of refreshments served in the supper room below. The revellers continued their merry-making until 11 p.m. when they very reluctantly departed homewards.

TELEPHONIC DEVELOPMENT OF THE WORLD AT DECEMBER 31, 1921.

BY W. H. GUNSTON.

IN the year 1921 some 950,000 telephone stations were added to the total for the world. As we should have expected, the bulk of this increase comes from North America, viz., upwards of 500,000, whilst Europe accounts for nearly 300,000. The total may be put at 21,798,000, made up as follows:

	1921.	1920.
Europe	5,560,000	5,248,000
Asia	585,000	507,000
Africa	102.000	95,000
North America	14,882,000	14,365,000
South America	307,000	286,000
Australasia	361,000	322,000
	21,798,000	20,823,000

The telephone stations of the United States increased by over 450,000, those of Germany by 100,000, and those of Canada and France by about 50,000 each.

It may be of interest to compare the development of the world at 1921 with that existing in 1911, ten years earlier. Despite four years of war in which all the chief telephone-using countries except Sweden and Denmark were engaged, and despite also ensuing years of comparative stagnation, an increase of 940,000 telephones during that period will be noted from the following table. The war and its effects told, of course, more heavily on Europe than on America, and increased the disparity already existing between the old and new worlds.

	1911. (*Thousands.*)	1921. (*Thousands.*)
Europe	3,156	5,560
Asia	204	585
Africa	36	102
North America	8,693	14,882
South ,,	88	307
Australasia	142	361
	12,320	21,798

Of the countries which now possess upwards of a quarter of a million telephones, the relative positions are as follows:—

	1911. (*Thousands.*)	1921. (*Thousands.*)
United States	8,357	13,875
Germany	1,514	1,915
Great Britain	701	998
Canada	302	902
France and Algiers	261	503
Sweden	199	390
Japan	159	370
Denmark	107	257
Australia	101	251

It may be observed that the number of telephones in Great Britain and Ireland at the end of 1922 (Post Office, Irish Free State, Hull and Guernsey systems combined) was about 1,060,000. In 1911 Russia occupied seventh place on the list, and the Austrian Empire eighth. Germany shows a good increase despite the decrease of territory which it has suffered, and France with the addition of Alsace-Lorraine has nearly doubled its figures. Sweden and

Digitized by Google

Japan have increased over 100 per cent., and Denmark and Australia 150 per cent.

In 1911 there were 102 cities with upwards of 10,000 telephones; in 1921 there were about 200, whilst the cities with 20,000 telephones and upwards numbered exactly 100. (*Vide* Table VII.)

A comparison of the development of some of the largest cities in 1911 and 1921 shews the following progress:—

	1911.	1921.
New York...	441,128	979,534
Chicago	279,383	605,495
Berlin (Greater)	177,854	347,735
London	220,782	345,797
Boston	140,153	313,295
Philadelphia ...	145,535	233,122
Paris	84,489	173,300
San Francisco	100,523	162,430
Los Angeles	86,922	162,118
Detroit	77,866	154,077
Cleveland	71,532	153,951
Pittsburg	71,249	129,436
Stockholm	73,600	110,095

It will be noted that the number of telephones in New York, Chicago, Boston, Paris, Detroit, and Cleveland has more than doubled, and that Berlin has nearly doubled its total. It is interesting to record that Los Angeles passed San Francisco during 1922 and that the latest available total for the London telephone area is 365,533.

Tables are annexed shewing the development of each country classified in continents.

TABLE I.

EUROPE.

NUMBER OF TELEPHONES.

	Dec. 31 1921.	Dec. 31 1920.	Population (Thousands)	Population per Telephone.
Austria (est.)	140,000	133,480	6,100	46
Belgium (see notes) ...	85,200	62,867	7,700	90

Total ...	5,560,000	5,248,000	400,000	74

* June 30.

The ratio of population to telephones in Europe, is unfavourably affected by the poor development of the Eastern and Southern States. If a line be drawn along the eastern boundary of Scandinavia and Germany, and southern boundary of Austria, Switzerland, and France, and embracing Holland, Belgium and Great Britain. it will be found that 4,786,000 of the 5,560,000 telephones in Europe are comprised within that line, yielding one telephone to every 38 inhabitants.

NOTES.

Austria, Czecho-Slovakia and Poland.—Information relative to 1921 has not been received. The figures given have been estimated from those for 1920.

Belgium had 61,932 subscribers at the end of 1921. This figure has been converted into "stations," by assuming that the relation between subscribers and stations is proportionate to that existing in 1920. There were 23,800 telephones in Brussels and about 12,000 in Antwerp.

Denmark.—This is the best telephoned country in Europe. Of the 257,672 stations, 138,950 belong to the Copenhagen Telephone Co., 68,236 to the Jutland Co., 17,713 to the Funen Communal Co., and 13,023 to the South Jutland Co.

Finland.—The telephone companies of Abo, Helsingfors and Viborg had between them 21,944 stations. No other information is obtainable, but as these companies do not serve one-third of the population of Finland, this figure had been doubled to arrive at the total for the country.

France has added nearly 50,000 stations. Paris has 173,300, Marseilles 12,414, Lyons 11,891 and Bordeaux 8,285 telephones.

Germany.—103,376 stations were added during the year. Greater Berlin now possesses 347,735 telephones, Hamburg 95,534, Munich and Leipzig over 40,000, Cologne, Frankfurt, and Dresden over 30,000, Breslau, Düsseldorf, Stuttgart, Nürnberg and Hanover over 20,000, and Bremen, Mannheim, Essen, Chemnitz, Magdeburg, Königsburg, Stettin Duisburg, Dortmund, Elberfeld and Halle over 10,000.

Great Britain and Ireland just failed to reach one million stations by the end of 1921. This total was attained in the following January. 981,529 were connected with the Post Office system, 13,470 with the Hull Corporation exchanges, and 2,806 with the Guernsey system. London had 345,797 stations, Manchester 47,301, Glasgow 42,514, Liverpool 38,219 and Birmingham 26,391. Edinburgh, Newcastle, Leeds, Bradford, Sheffield, Dublin and Bristol all had 10,000 telephones and upwards.

Italy had 111,711 telephones at June 30, 1920, and 116,922 at June 30, 1921. It may therefore be assumed that there were 119,000 at the end of December. In June, 1922, Rome had 14,573 stations, Milan 19,938 and Genoa 8,161.

The Netherlands.—The total for 1921 has been obtained by increasing the figure for 1920 in accordance with the usual rate of development in these countries.

Portugal.—The Anglo-Portuguese Telephone Co. had 14,673 stations of which 10,741 were in the Lisbon district. The State system comprises upwards of 1,000 stations.

Russia.—Information relating to the States formed out of the late Russian Empire is difficult to obtain. Poland, Finland and Esthonia are dealt with separately. Information from Moscow shews that there were 133,280 telephones in 57 Governments in 1920, and 73,768 in 50 Governments in 1921. The former figures probably included States more loosely connected with the Soviet rule. If allowance be made for the Ukraine, Lithuania and Latvia, an estimate of 200,000 for Russia and these States will not be excessive.

Roumania.—Bucarest had 8,537 stations and Cluj 1,495.

Sweden still shews a slight reduction in her total, due, no doubt, to the effects of the amalgamation of the Stockholm Telephone Co. with the State system. Stockholm itself has gone back to 110,095 from 118,180. Gothenburg has 22,804 stations and Malmö 12,043.

Serbs, Croats and Slovenes.—The total has increased by 4,000. Zagreb has 2,569 stations and Belgrade 1,907.

Switzerland shewed an increase of 7,996 stations. Zurich has 21,000 telephones, Geneva 14,199, Basle 12,179 and Berne 10,205.

Spain.—See note on Netherlands.

Turkey.— „ „

HOW THE TELEPHONE WORKS.

By A. CROTCH.

V.

Automatic Telephony.—By the earlier term, "automatic working," was meant that in order to gain the attention of the exchange the calling subscriber had merely to lift his receiver from its hook. By the present term is implied a system by which the human operator at the exchange is dispensed with and suitable machinery installed there to perform mechanically all the operations of switching. The switchboard, with its jacks, indicators, plugs and cords, is superseded by mechanism, the centre and chief of which, in the system we are about to describe, is a spindle switch capable of vertical and rotary motion at the will of the subscriber.

Such a machine is shown, in principle, in Fig. 15. A spindle or shaft carrying some ten ratchet steps (circular in plan) on its upper portion and some other ten arranged in a series of vertical slots or teeth, is supported in suitable bearings. When the electro-magnet VM is energised, its armature, by means of a suitable pawl, lifts or strikes up the shaft one step. If a number of impulses (not exceeding ten) are passed through VM, the shaft will rise a corresponding number of steps. Similarly, if RM be now energised it will propel the shaft round one step and so on up to the limit of ten steps. Another pair of pawls or "double dog" DD, ensures the support of the shaft in the intervals. Further, as the shaft rotates, it winds up a flat spiral spring and it naturally rises against gravity. If the spindle is released (by the double dog) the spring will rotate it in the opposite direction and its weight will cause it to fall. The striking away of DD is the function of the third electro-magnet, Rel. M. When this is energised the spindle is allowed to rotate backwards, and then to fall to its normal position.

On the lower part of the spindle a pair of metallic arms are mounted, insulated from the shaft and from each other. Before these is a "bank" of 100 double contacts, arranged in ten layers of ten each, so as to form an arc of a circle, the centre of which is the spindle. These 100 double contacts are connected to 100 subscribers' loops.

The arms are normally just to the left of the bank and below it. A single impulse through the vertical magnet brings them to the level of the lowest row of contacts: two impulses will bring them to the second and so on. One impulse through the rotary magnet will then turn the spindle one step, and the contact arms, which are separated from each other by a very small space, will "wipe" or rub over the first pair of contacts on a particular row. Three impulses through RM will bring the arms over the first and second contacts and to rest on the third and so on. Now, if these 100 sets of contacts represent 100 subscribers (strictly speaking, 99, in order to keep to two figures) we can, by lifting and rotating the shaft, cause the contact arms or "wipers" to make contact with any one of those loops, the calling subscriber's line being connected to the wipers and thus through, *via* the contacts, to the desired subscriber. Thus, for number 63, we must cause six impulses of current to pass through the vertical magnet—which will lift the shaft to the sixth level—and three impulses through the rotary magnet, which will bring the wipers on the third position on this level, or on No. 63.

Now, since each switch or "connector" is under the control of a subscriber, the 100 double contacts on the bank of each must be multipled together, so that every subscriber shall have before him the whole exchange. Again, some means must be devised so that when any member is engaged at any one switch, an indication shall be given on all the other switches that this is the case. This is effected by fitting a second bank of 100 (single) contacts above the first, and another pair of wipers to engage with these, as in Fig. 16 which repeats the spindle. The two wipers of this pair are connected together so as to rub on both sides of the single contacts. We thus have a line bank of contacts and a "private" or local bank, all the latter being multipled together like the line banks.

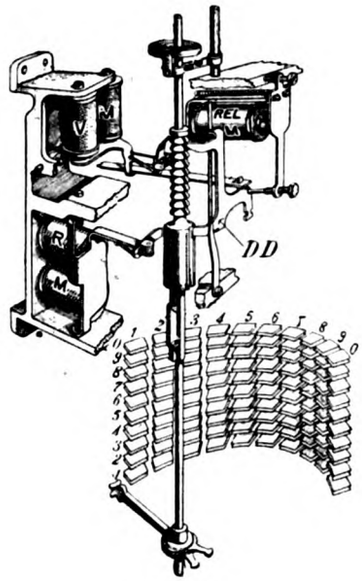

Fig. 15.

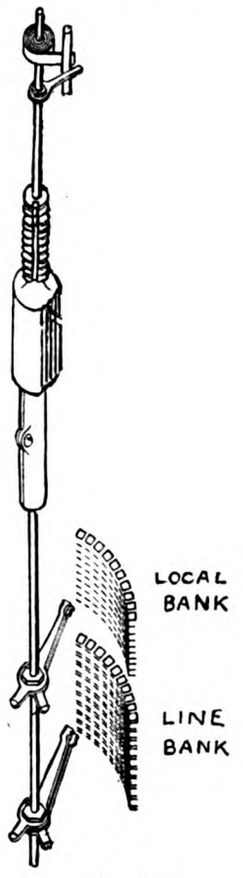

Fig. 16.

The analogy between these arrangements and those of the switchboard is easily seen. The wipers correspond to the answering switch-springs of the manual board, since it is on these that the calling subscriber appears; whilst the multiple (line) banks are the avenue by which the wanted subscriber is obtained. The local multiple banks correspond to the sockets of the jacks and sleeves of the plugs.

A simple way of sending the impulses is as follows:—At the subscriber's end, it will be remembered, a condenser and magneto bell are across the lines, for ringing purposes. At the exchange imagine one line to be brought to the vertical magnet and the other to the rotary, the battery being connected to both. By suitable means we can earth, at the subscriber's end, first the vertical line for the required number of times for the tens' digit and then the rotary line the necessary number of times for the units figure. Other means will, of course, be required to ring up the wanted subscriber or to indicate that he is engaged, the means of calling, clearing, &c.

Since each subscriber has one of these connector switches, there will be as many such connectors as subscribers. But if the whole of the exchange were busy at once, only half the connectors would actually be in use—those belonging to the calling subscribers. Hence half the number would be the *maximum* required for actual connection. But this state of things never occurs and a considerably smaller number will suffice. A much simpler piece of apparatus, the "line switch," is therefore allotted to each subscriber, and on the lifting of the receiver this is actuated and automatically "hunts" or searches for a disengaged connector. As regards these line switches, the connectors must be multipled to them, so that any line switch can pick out a disengaged connector.

Again, a 100-line exchange is very small: a three-figure (999) system will generally be the lowest practicable scheme. To bring in the third (hundreds) digit, an additional and simpler form of

Digitized by Google

connector is used. The connector proper is then utilised to pick up the units and tens figures and the new intermediate switch or selector is placed in series with it to select the hundreds digit. A four-figure (10,000) exchange will require two selectors and so on. We thus have line-switch, 1st (and 2nd, &c.) selector, and connector; or, in more formal terms, a pre-selector, 1st and 2nd selectors, and final selector. We shall, however, keep to the first terms and a three-figure exchange. This involves the line switch, to whose contacts the selectors are multipled: the selector, to whose banks the connectors are multipled, and the connectors themselves, to whose banks the subscribers' lines are multipled. The office of the first is to put the caller through to a selector, that of the latter to put it through to a connector, and that of the last to put it through to the required subscriber's line. The manner in which these operations are performed is as follows:—Imagine that No. 365 is required. The subscriber lifts his receiver and commences to "dial" the first figure. Before he does this, however, his line switch has been actuated and has picked up a disengaged selector. The signalling of the first figure (3) steps up the spindle of the selector to the third level and it immediately, and automatically, hunts along that level until a disengaged connector is found. The second figure (6) steps up the spindle of the connector to its sixth level, and the third figure (5) causes it to rotate to the fifth position.

The principle we have just outlined is the Strowger system of automatic telephony. We now propose to show how that principle is applied by the Automatic Telephone Manufacturing Co.

First, the dial switch on the subscriber's telephone, by which the impulses are sent to the exchange. The subscriber's circuit is normally interrupted by a condenser. When the receiver is lifted this circuit is completed through the subscriber's instrument. He then dials the required number, which we will assume to be 365. The dial, in returning to zero after each figure, disconnects the circuit of the loop a number of times—3 times for the first, 6 and 5 times for the second and third figures. The "impulses," therefore, are really short intervals of disconnection, that is, the circuit (receiver off) is normally closed and current flowing, and the return movements of the dial interrupt this flow the requisite number of times. This finishes the subscriber, and we now go on to the equipment at the exchange.

Rotary Line Switch.—One of these is permanently fixed to each subscriber's line. It is a combination of three parts: (*a*) a bank of 100 single contacts arranged in a semi-circle in four sets of 25; (*b*) four rotary wipers on a single spindle, each wiper making contact on one of the four sets of contacts; and (*c*) an electro-magnet. When a current of sufficient strength passes through the latter its armature is attracted, but in its movement breaks the circuit, so that if a battery were continuously applied, the armature would make and break like an ordinary trembler bell. On the shaft carrying the four wipers is a ratchet wheel, and on the armature a pawl, which, on the release of the armature, propels the wiper shaft forward one step. Further, each wiper arm extends both ways (on a diameter) and carries a wiper at each end, so that when one wiper leaves the last contact of the series (of 25) the wiper at the other end starts on the first contact of the series. There is thus no zero position and the wipers are always ready.

Two of the wipers carry the circuit (+ and −) and one the "private normal" or local connexion to the local multiple bank. The other is left disconnected, for reasons which do not concern us here. Each set of four contacts touched simultaneously by the wipers has three of its contacts taken to a selector, and the fourth left disconnected, as above. When the selector is engaged, its local contact, *i.e.*, the contact in the local multiple bank, is earthed. Hence, when the local wiper of the switch makes contact with it, the electro-magnet battery is earthed and the wipers propelled forward to the next position, on which is another selector. When a disengaged selector is found, its local contact is simply disconnected, the electro-magnet is not energised, and the wiper remains stationary.

(*To be continued.*)

TELEGRAPHIC MEMORABILIA.

IT was a personal disappointment that the writer could not be present at the Presentation Concert held in the honour of Mr. F. J. Muller (Assistant Superintendent of the C.T.O.) on Monday, Dec. 18 last, with Mr. G. T. Hutchinson, Plant Superintendent, and himself a veteran, in the Chair. That a "previous engagement" was the cause, it is hoped, will be accepted as something more than an excuse of the euphonious type. Thanks, however, to the kindness of a colleague our readers will not be deprived of an interesting if brief account of the proceedings. The Deputy-Controller, Mr. A. W. Edwards, at some personal inconvenience was present, and added to the representative nature of the send-off to our old friend "Fred," the celebration of whose retirement formed the centre-piece of the evening's function. Mr. Edwards showed his correct psychological appreciation of a function of this kind by making a brief and very interesting speech during the proceedings, and alluded to the exceptional number of retirements due to eventuate during the next two or three years.

The Chairman, unfortunately, owing to an anticipated long train journey was compelled to leave some time before the gathering broke up. He did so, however, with complete confidence that he was able to hand over his duties to a most competent "Vice" in the person of Mr. C. Sanderson (Master of Statistics!) His confidence was not misplaced as all had anticipated.. Before Mr. Hutchinson left, however, he presented a time-piece to our mutual-friend and colleague on behalf of the many well-wishers and admirers of the latter. "Fred" duly replied and was evidently deeply moved by the many expressions of affection and esteem. He may rest assured that even the things left unexpressed or expressed, as he said, *to his own dissatisfaction*, were well understood and appreciated by everyone present sympathetically attuned as they were to some of those thoughts which would naturally surge through the mind of our kindly colleague at so momentous a milestone of life.

The musical programme was under the competent guidance of Mr. R. Comben who provided specially good fare by the aid of many old friends and well known artistes, Messrs. C. Oberst, Frank Hudson, Gould, Bert Sainsbury, Brereton, Orchard, Culley, Mr. Comben himself contributing to the general delight of the audience. Mr. Dowson gave a delightful rendering of the "Intermezzo to Cavaliera Rusticana" on the violin, while Mr. Bonnor as accompanist, maintained his usual high excellence.

Yet another retirement took place towards the end of last year which, though not *on* the Traffic staff of the C.T.O., was yet most decidedly of it. Mr. Hunt, Skilled Workman, Class I, was a well-known figure of the Engineer-in Chief's Department. He was one of those quiet unassuming personages, attached to "Maintenance"—with which the C.T.O. engineer has been blessed by not a few, who knowing their work thoroughly are never unduly disturbed by the queries and obstacles at times—unwittingly be it said—may be placed in their way by some of us of the Traffic side.

In so large an office as the C.T.O. where modern developments are causing almost daily changes, it is impossible, certainly at times, not to miss some new detail of construction, lay-out, &c. One never appealed in vain to Mr. Hunt for help or information who would however always make light of any service thus rendered. Many happy returns of your retirement date, Mr. Hunt! May your *lines* always fall in pleasant places; may you never come in *contact* with misfortune and may your *voltage* keep steady to the last.

The retirement of Mr. H. E. Dauncey, Assistant Superintendent, on the 7th ult., at the age limit is also to be noted, and his withdrawal from C.T.O. activities will be felt in no circle more than in that of the P.O.T.A. Society of which he was Branch President.

Presentations have likewise been well to the fore of late, to Mr. H. A. Longhurst, to Mr. E. J. Dawe, and Mr. Joe Kellaway, for example, all showing the spirit of sweet remembrance and good comradeship of old colleagues of the Telegraph Service.

Indicative too of the same spirit of kind thoughtfulness was the collection of the U.P.W. to provide Christmas dinners for children of the unemployed, as also the collection for that smaller fund to present each of the thirteen orphan children elected to orphanages by means of the C.T.O. Benevolent Fund, with the sum of 10*s.* as a Yuletide gift.

In International Telegraphy one is used to receiving telegrams by all possible combinations of devious routes, but during the month of December, owing to a certain breakdown of wires, a small shoal of Americano-British traffic reached London from the United States *via* the Continent, which if it led to complication in International accounts certainly showed excellent co-operation between the various wireless organisations of America and Europe. Thus traffic from New York, Philadelphia, &c. reached London *via* the new French wireless station of St. Assisse near Melun, not far from the forest of Fontainebleau, thence to the chief office of the company in the Rue Haussman, Paris, and thence, it is believed, by pneumatic tube to the Central Telegraph Office in the Rue Grenelle, and lastly, by direct line to the English capital. Some of this traffic had again to be diverted eastward by cable. Other traffic reached London *via* Berlin wireless, and yet a third portion of the diverted telegrams reached this country *via* Stavanger wireless. Thus round-about journeys of certain telegrams were noticed, such as one from Jersey City to Bombay which came from the U.S.A. by wireless to Norway, thence by cable to England, where it was handed to the Eastern Telegraph Company on a cable jaunt of another few thousand miles.

Successful wireless trials were carried out between the C.T.O., London, and the High-Speed Telegraph Laboratory, Berlin, during the early part of

Digitized by Google

last month by means of Hughes' printing telegraph apparatus. The arrangement was for simultaneous two-way working, London controlling the aerial of the Stonehaven wireless station by an overhead low-resistance line of about 500 miles in length. Konigswusterhausen's signals controlled by Hughes' apparatus at Berlin were picked up by the Central Wireless Office, Roof, C.T.O., and passed down by means of a relay to the Hughes' receiver in the Cable Room. Arrangements may shortly be made to put this new method into daily practical use. Should the result prove satisfactory, there is considerable probability that wireless communication between England and Germany may take another step forward in the direction of a higher speeded type of telegraph printer.

The *Electrical Review*, in paying tribute to the late Sir John Gavey, who died during the fading days of 1922 at the ripe age of 80 years, records as follows the list of other notable names in electrical and kindred activities who have passed to the Great Beyond during the year recently closed. Our contemporary says :—"Such familiar names as J. J. Easton, R. E. Graves, Dr. Edward Hopkinson, Dr. J. T. Merz, G. G. Ward, Sir John Benn, B. S. Broadhust, F. E. Hesse, Dr. Gisbert Kapp, H. W. Miller, Sir A. K. Rollit, and Sir R. Vassar Smith all carry with them suggestions of various specialised departments of activity in which the men who bore them performed a leading part in this country, while the death of Graham Bell, of telephone fame, was a world loss, and the disappearance of Dr. Walther Rathenau by a murderer's act removed from the stage one who seemed to be destined to do much to put Germany upon her feet as well as to organise her electrical and other industries for future expansion."

What *The Times* calls "a radio express telegraph service has been opened between Berlin and Budapest. This is said to be the first occasion upon which Siemens telegraph instruments giving a speed of about one hundred words per minute have been employed in an international radio service."

Successful trials across the Atlantic have, however, been made between Berlin and New York by the same type of high-speed printing telegraph apparatus.

The development of wireless by the German authorities demands the careful attention and study of all interested in wireless matters, and the following condensed report from a recent number of the German *Telegraph und Fernsprech Technik* will be read with interest by most of our wireless readers, all indeed who are keen for the future of the craft of telegraphy.

From about a year or less after the Armistice Germany has been organising a wireless system which already consists of a central post at Berlin ; 17 provincial stations, the principal having multiple transmitters and the secondary simple transmitters ; 75 receiving stations ; 7 meteorologic receiving stations, and 2 coast stations—at Norddeich and Swinemunde. The central post at Berlin comprises a transmission installation at Konigswusterhausen, and a receiving installation at Zehlendorf, both controlled from the Berlin central telegraph office. The equipment at Konigswusterhausen consists of one 32-kW Poulsen ; one of 5/10 kW ; two tube transmitters of 5/10kW ; five tube transmitters of 2×500 W ; and five transmitters of 500 W. All these transmitters are furnished with separate antennae, and can work simultaneously with distinct wave-lengths. The big tube transmitters consist mainly of 10 tubes of 1.5 kW each. For the chief provincial posts, the transmission apparatus is separated from that of reception (by from 1 to 2 kW), and is worked on the duplex system.

Although a belated item, it is as well to place on record the fact that "In the French Chamber on Dec. 23 an amendment by the Deputy, M. Lambert, to authorise the telephone service being transferred from the Government to private hands, was rejected by 397 votes to 170. The Postmaster-General declared that such an amendment, if passed, would lead to gross abuse on the part of speculators.

Further, that the French Chamber, on Dec. 27, continuing the discussion of the Posts, Telegraphs, and Telephones Budget, the Under-Secretary of State of the P.T.T. said that State cables would not be ceded to private companies. With regard to the Brest-Dakar-Pernambuco cables, it was stated that the prolongation of the Dakar-Pernambuco line in South America was being investigated. It had not yet been decided whether this new line would be developed by the State or by a private company, and the question would be settled by Parliament. With regard to the request made by M. Loucheur for the reconstruction of the Paris-London, Paris-Strasbourg, Paris-Lille, Paris-Marseilles, Bordeaux, &c., cables, the Under-Secretary stated that his suggestions were to be carried out."

Equally interesting is the report, issued by the Treasury of the Pacific Cable Board for the year ended March 1922. The salient features are as follows :—"The receipts exceeded the ordinary expenses by £210,257. From this must be deducted a special contribution of £100,000 to the Reserve and Renewal Fund for cable duplication. Traffic receipts were £521,643 or £98,409 less than those of the preceding year. This was largely the result of the re-instatement of cheap services, especially week-end telegrams. The Board has recently placed a contract with the Telegraph Construction and Maintenance Co. for the laying of cables between Suva (Fiji) and Auckland (N.Z.)—a distance of over 1,300 nautical miles ; and between Southport (Queensland) and Sydney (N.S.W.)—about 540 nautical miles. The cable steamer *Colonia* will lay the cables by August next, it is hoped."

This apparently is but the beginning of the duplication scheme which, when completed, will probably cost from £250,000 to £500,000.

The longer section—that from Bamfield to Fanning Island—is to be taken in hand later. Important experiments by the Telegraph Construction and Maintenance Co. have been so far successful that a new and improved type of cable will, it is believed, be perfected in the near future. This promises such a gain in handling the traffic that the Board is awaiting the result of further tests before making a decision whether the duplicate Fanning Island to Bamfield cable shall be of the type of those now ordered or the new one.

Thanks to those many friends of the Telegraph Service who have favoured us with New Year's cards of greetings from across the sea, Canada, Belgium, France, New Zealand, Australia, India and China, for example. The kindly thoughts are much appreciated and are heartily reciprocated.

"JANUARY 15, 1923, will stand as an historic date in telephone history," said Mr. Frank Gill, President of the I.E.E., on the above-mentioned date in the opening sentences of his lecture, on "Some Aspects of the Art of Communication" given before the members of the Telephone and Telegraph Society of London. This is undoubtedly true, as is also true the fact that Mr. F. Gill himself was among the favoured few, who at 2 a.m. that morning heard the first real telephone message to reach us across the Atlantic with a distinctness by no means always equally on local lengths, thus witnessing one of the greatest wireless feats of communication yet established. Apart from this announcement the most interesting feature of a most interesting lecture was the earnest persistence with which Mr. Gill returns to the subject of the International Telephone Service of Europe, and provided the existence of a real Central Controlling Authority continues to emphasise the possibilities which remain ready at hand to be realised if only there were more unity amongst the nations, less suspicion and more good faith.

From the London *Times* we learn that several months ago the Danish Government sent an engineer to Greenland to examine the possibilities of establishing radio stations in that Danish colony. He has now returned and advised the establishment of four stations. It is expected that three will be established on the west coast and one on the east coast, near Angmagsalik, the latter in response to a special request from the Government of Iceland, which declares that a station there will be of the greatest importance in transmitting weather information to Iceland.

According to *Indian Engineering*, some progress has been made in the installation of the radio telephone in the Moplah tracts of Malabar and a few sets have been installed and messages transmitted and received.

Big schemes are anticipated to materialise in connexion with broadcasting in Norway. The Norwegian Radio Co., the Norwegian Marconi Co., and the Norsk Telegram Bureau companies intend to form a joint broadcasting telephone company for the purpose of building sending stations in Christiania, and subsequently at Bergen and Trondhjem, each with a radius of one hundred miles, for the regular transmission of concerts. Receiving apparatus, for hire by subscribers at an annual fee, will be placed under the control of the telegraph board. The companies, having applied for a concession, have also requested Government leave to build a large radio-telephone station in Christiania in order to broadcast Press exchange news and weather forecasts over the whole of Southern Norway. Radio-telegraphy is intended to be used for long distances, such as Trondhjem and the North Cape.

The most interesting demonstration in this country up to the present of the possibilities of broadcast telephony was arranged for Jan. 8, when parts of the British National Opera Co.'s performance of Mozart's "Magic Flute" at Covent Garden was radiated from the London station of the British Broadcasting Co. The demonstration was highly successful and selections from operas will be broadcast nightly until the conclusion of the present Covent Garden season.

Some of our C.T.O. enthusiasts who listened in to this display and whose musical ears are of the most fastidious attunement assure the writer that for one-and-a-half hours not a note was missed. The range of the London aerial, it is understood, was somewhat increased during the early part of last month.

Reuter's Agency is responsible for the following item forwarded by their Constantinople correspondent to this country. The Angora Government has decided that Adnan Bey shall henceforth act as delegate at Constantinople of the Commissariat of Foreign Affairs of the Grand National Assembly of Turkey. He will negotiate the handing over to Turkish control of the posts and telegraphs, the cable of the Eastern Telegraph Co., and of the Constanza cable requisitioned by the Frency military authorities.

Such has been the success of the Anglo-Dutch telephone cable that the need of a second has already become sufficiently urgent as to necessitate the laying of a second cable, thus providing three more circuits between this country and Holland.

It is noted with regret, that one of the chief compilers of Bentley's code who was actually employed at the time in the preparation of a section of that complicated work for the special use of bankers, recently committed suicide. Evidence was given that deceased had suffered from depression and insomnia for as one can well imagine, "the work upon which he had been engaged demanded extreme concentration and apparently the brain gave way under the strain."

The following telegraphic arrangements are being made by the local Government for the sending of messages to ships in the harbour of Port of Spain, San Fernando and Brighton, and for the captains of such ships to communicate with their agents in Port of Spain. It has also been decided to establish a receiving station at North Post, which will do all receiving work, the Tobago traffic, and ship work. The Port of Spain station, which will be the controlling or head station and the one with which alone the public will deal, will thus be left free for long-wave work with Venezuela, British Guiana, St. Martin, Curacao, &c. Communication between North

Digitized by Google

Post and the head station will be maintained by the existing telephone line and also radio. A scheme for linking the telephone systems of Tobago and Trinidad by radio is also likely to be inaugurated.—*Financier.*

We are indebted to *The Times* for the following interesting and succinct account of some of the "freak" results of broadcasting, some of which our wireless friends have already noted, regarding the "blind" (or should it be "deaf?") spots well-known to our wireless amateurs and others :—

"Several freak results have been observed since broadcasting began in this country. One problem is why the London programme should be heard faintly in Yorkshire and strongly in the North of Scotland—more strongly, in fact, than the Newcastle programme; and why Southampton and Portsmouth should hear the Manchester programme with ease and the London programme with difficulty. Furthermore, why should such spots exist, where wireless signal cannot even be heard at all? Several such places have been discovered in England. Didcot is one, Newbury another. The same problem has presented itself elsewhere. America has its 'blind spots,' and the Dutch Army authorities found it impossible to reach a certain area of four square miles by wireless signals. Geological conditions, contour, the presence of water, and atmospheric conditions are all believed to be influencing factors. It is believed that 'fading' and 'blind spots' are parts of one and the same problem. 'Fading,' is a known phenomenon, which is much more pronounced when a short wave-length is employed. This explains why English amateurs can often pick up Paris and The Hague messages with greater ease than British messages. When the wave-length is over 600 metres there is comparatively little 'fading.' The average wave-length of the British broadcasting stations is 400 metres. It has been found that 'blind spots' vary and move with the alteration of the wave-length. Among other 'freak' results recently registered was the receipt of the Newcastle programme at Gibraltar, and of the London programme on a crystal receiving set at Bridlington."

Brighton is another spot where audition is at times "dead" and by some is attributed to the chalky soil of the neighbourhood. This is apparently quite unconfirmed up to the present.

The Cableites have been pleased to note the visits of certain representative parties from our friends of the F.T.B. to the Foreign Section of the C.T.O., where they have been able to realise some of the difficulties with which the staff and supervision have to cope. One of the comments of a party of these was, "How cramped you are for space!"

One could well soliloquise upon the uncertainties of life, its defeated anticipations, plans and hopes on the occasion of the sad and what, from a human point of view, was the *premature* death of the much respected Assistant Controller of the C.T.O., Mr. W. H. Offord. Never robust but possessing a strong, quiet, patient will, he had struggled through years of adverse conditions in his private life due to the ill-health of those near and dear to him. Never dismayed but courageously picking up the threads of life when "outrageous fortune" appeared to have done its worst, he pressed quietly on once more. Official success finally seemed to be making an attempt to balance the inequalities by advancing our late colleague no less than four steps within twelve months, *i.e.*, between Aug. 1, 1921, when he was made Superintendent, B class, passing to C class the succeeding month, to the Higher Grade in March, 1922, and was promoted to Assistant Controller on July 20 last. Those who noted the change which came over our much-regretted colleague soon after this date were justifiably alarmed, but were scarcely prepared to believe that before the end of the year he would be with us no more. To his wife and daughter the sincerest heartfelt sympathy is respectfully tendered.

A Modern Prophet's View of Life :—

> "Life is still only a promise, still waits to be born, out of such poor stirrings in the dust as we. . . .
>
> "Some day here and everywhere, Life of which you and I are but anticipatory atoms and eddies, life will awaken indeed, one and whole and marvellous, like a child awaking to conscious life. It will open its drowsy eyes and stretch itself and smile, looking the mystery of God in the face as one meets the morning sun. We shall be there then, all that matters of us, you and I. . . . ."—*H. G. Wells.*

J. J. T.

LONDON ENGINEERING DISTRICT NOTES.

Extension of the London Engineering District.

BY the time that these notes appear in print the absorption of portions of the surrounding provincial districts by the London Engineering District will have been accomplished, and the staff will be settling down to the new conditions.

Although the Engineering Department has reason to be proud of its organisation and methods of standardisation, which, indeed, can be rivalled by few concerns of equal size, yet, owing to the latitude wisely allowed for dealing with local peculiarities, there are inevitably differences in administration between districts. The reasons for these differences may not at first be apparent to those who may be slightly inconvenienced thereby, but after a few weeks the machine will be found to have overcome the temporary check and to be running perfectly smoothly again.

The total addition to the staff of the London district is 536, and a cordial welcome is given to them. It is hoped that they will identify themselves quickly with the various organisations, technical, social, and benevolent, which already exist and will give their London colleagues the benefit of their experience in provincial organisations of similar character.

Benevolent Society.

The special attention of the newcomers is drawn to the work of the London Engineering District Benevolent Society. The members of this Society subscribe one penny per week, and with the money thus contributed the Committee make grants to necessitous cases. This avoids the constant necessity of "sending the hat round," and also enables a subscriber to accept assistance when the necessity arises without feeling that there is a stigma about it. Few can be absolutely certain that they will never need such relief. If a subscriber does not need to receive anything from the fund, he has something to be thankful for, and the knowledge that he is able to help men who are down on their luck is also a cause for thankfulness.

Applications for Telephone Lines.

The boom in trade which followed the Armistice resulted in a large number of applications for telephones which could not be met owing to the shortage of telephone plant. At one time there were over 14,000 applications in London that had to be refused. It was difficult for subscribers to understand why they could not be joined up immediately, and some very hard things were said about the Post Office. Business men who held commissions in the army and saw the expeditious work carried out by Post Office staff attached to "Signals," expected to be connected up with equal expedition. They knew nothing of the difference between the work of slinging a few wires to trees and hop poles and that of providing a properly designed underground system that would allow for expansion, and they thought that the delay was accounted for by the difference in administration. Those who know and appreciate the difference in the nature of the work will be glad to learn that by Dec. 31, 1922, all the arrears had been wiped off. This means that not only have wires been provided for actual applicants, but prospective applicants have also been provided for at the same time. This has only been possible by the active and cordial co-operation of all ranks and we may now congratulate each other.

We cannot spend much time, however, in admiring ourselves. There is still much to be done before London has a telephone service such as the greatest and most important city in the world ought to have. An appetite for telephones must be created, and the means to satisfy that appetite placed within easy reach of every potential subscriber. It must also be possible to provide the meal without undue expense, and that can only be done if the utmost work of hand and brain is applied to increasing the output.

The larger the service becomes the greater will be the opportunity for the competent man to prove his worth.

Retirement of Mr. J. E. Gibbons.

A large and representative gathering of the staff of the London Engineering District assembled at North Side, Wandsworth Common, on the evening of Dec. 28 last, to bid farewell to Mr. J. E. Gibbons, the Executive Engineer of the South-West External Section, on his retirement from the service under the age limit. As a mark of their esteem the staff spontaneously decided to present Mr. Gibbons with a handsome half-hunter gold watch and chain, and an aneroid barometer, accompanied by a gold brooch for Mrs. Gibbons. Mr. F. F. McMillan, Assistant Engineer, presided, and Messrs. Shackleton, Holmes, Judd, Mizen and H. Sperry, representing the various grades, bore testimony to the genuine personal regard in which Mr. Gibbons is held.

The Superintending Engineer (Mr. R. McIlroy), in making the presentation, expressed regret that the time had arrived when the Department was to lose the services of so excellent an official, and feelingly referred to the difficulty which he and others felt in saying goodbye officially after so many years of association. Mr. McIlroy made it clear that Mr. Gibbons, although he had reached the age limit, was leaving the service solely at his own request, and he commented in flattering terms on the tactful and capable manner in which Mr. Gibbons had performed the various grades of his duties, thereby gaining the esteem of all his colleagues from the head of the District downwards. He trusted that both Mr. and Mrs. Gibbons would be spared many years to enjoy well-earned rest with the accompaniment of good health and happiness.

Mr. Gibbons hails from the North, and joined the Service in 1878. He was transferred to the Engineering Department of the Post Office in 1887. He had a thorough knowledge of the intricacies of telegraphy, and his technical attainments marked him out for early advancement. He served as Engineer in charge of the Fenny Stratford Section of the South Midland District for six years, and in 1900, when the Department undertook the telephoning of the Metropolis, came to London, where he had no small share in laying underground cables in the City, the streets of which, it may truthfully be stated, are the most congested of any in the world. His wide experience and his thorough knowledge of men assured the successful termination of the work, and on its completion he took up his headquarters at Wandsworth Common. Here he has been responsible for the carrying out of many important works, and the present satisfactory condition of the plant in the South-West Section bears eloquent testimony to the energy and ability displayed by Mr. Gibbons in the performance of his duties.

Mr. Gibbons has given no definite indication of his future line of action, but if the difficulty of obtaining a house to which he had been heard to make reference can be successfully negotiated, it will not be surprising to hear of his taking up his abode at Southsea, a place with which he has had pleasurable associations in the past at holiday times. That he will succeed in obtaining his desires, and that he has a long period of rest and contentment in store for him, is the wish of all who have come into contact with him during his official career.

"TALK OF MANY THINGS."

WE have pleasure in announcing the results of the "Amusing Incident" Competition :

First Prize (half-a-guinea, &c.)—"Anonymous," Liverpool.
Second Prize (the JOURNAL free for a year.)—Miss Z. F. Rich, Llandudno ; Miss I. James, Weybridge.
Third Prize (mirror).—Miss M. L. Roxburgh, Llandudno.

It is hoped to publish next month (with her permission) the name of the first prize winner.

The Misses Rich and James have tied for the second prize ; and by the courtesy of the Editor of this JOURNAL, a year's JOURNALS will be sent to both winners.

The winning stories will be published in later issues, with the exception of the one gaining the third prize, "Courtesy in the Provinces," as this appeared (inadvertently) in the November issue of the JOURNAL.

In next month's London Telephone Service Notes will, in all probability, be given a report of the meeting of the Telephone Staff Hospital Collections (in connexion with the Hospital Saturday Fund) to be held on Jan. 25—after these notes go to press.

The exact amount subscribed by the Telephone staff is not yet known ; but we are assured that we have attained to—and passed—the ambitious amount which Mr. Preston had hoped to reach before his retirement, viz., £2,000. We congratulate Mr. Preston, the Honorary Secretaries, the Fund, and ourselves !

The Gentle Sub.

If it were not for fear of shocking the London Telephone Service until the very plugs trembled in their sockets, we would boldly assert that the natural enemies of telephonists are subscribers. We know this is directly contrary to all the teachings and tests and rulings which have been instilled in telephonists since their first awe-inspiring day at the Schools ; but it is true, and the subscribers have only themselves to blame. If a subscriber gets a wrong number, or is rung in error, he has the whole of the Press in which to make his complaints to the world, and legions rise to support him. It has just occurred to us that *we* have got, at least, a *Column* of publicity, and it will do us good to voice those thoughts which we have to suppress underneath a suave rising inflection, a cooing invitation to "call again," when we are simply bursting to consign the callers to nether regions.

We may have bones which are long since dead to the weight of a transmitter—and they *do* become heavy by the end of a day—and ears whose cartilages resemble the tracks of a scenic railway—but we still have feelings.

We are told to enunciate clearly and distinctly ; if we do not, there is an irregularity up against us. We are impelled always to employ a tone of voice which shall be gentle, tasteful, sympathetic, inviting trust and confidence. We must always forbear and make things generally easy for subscribers. We are taught this, until it becomes second nature to us. But what of the subs ? Who is to teach them ? Who is to bring them to book and make them have just a little regard for the telephonist attending their lines !

We maintain that we are entitled to as much consideration as they.

Heads of firms—the real owners of the telephones—are invariably polite and considerate. They speak in cultured tones and restore the receiver with a gentle movement which does not leave us with splitting headaches for the rest of the day. We are mutely grateful to those of this kind and would slavishly wait upon their signals and call them for numbers in a frenzied effort to show our appreciation. A telephonist *loves* a kindly subscriber with that impersonal love which is permitted by a genial department. It is the minions we are up against and would wage war upon. The "cheeky" office boy who says, truculently, "Er you goin' ter gimme my number, Miss ? Sorry to disturb your nap." The pert office girl who yells out a number in a shrill voice miles away from the telephone, or with her mouth full of hairpins—if some inconvenient person wants a number whilst she is engaged upon her toilet—and rudely tells us to "wake up" if we repeat the wrong number.

The haughty typist who declares she is the Duchess of Goodness-knows-where, and threatens to report us every five minutes, and assumes a tone which no Duchess of our English aristocracy would ever dream of using.

The hateful "New Rich" who tells us if it "wasn't for the likes o' me, you young wimmen wouldn't be wanted for your jobs."

The shrewish women who grumble and complain the minute they lift the receiver.

The foreigners of every nationality upon earth, who speak their own particular idea of our language and then demand to know if we do not understand English.

The old gentleman who barks at us ; the men in a hurry who gabble, the men with a nasty wormy slur in their voices who always seem to imply something far more than the number they ask for—Ugh !

The P.B.X. telephonist who has a little learning and never omits to expound it. . . .

Through it all, we have to sit almost like divinities—never giving way, never relaxing our attitude of meek and smiling efficiency. Always straining, straining to listen, to catch the barely muttered phrases, to repeat them correctly, to guide these peevish clients of ours through the mazes of their own pitfalls.

Oh, to the Outer Limbo with the lot of them !

Psychologists would say this is a very unsuitable atmosphere in which to work ; but—"ours not to reason why." If this *should* happen to catch the eye of a subscriber, please, *dear* man or woman, *do* try to speak clearly and distinctly to us, and *always* adopt a kindly tone. It makes *such* a difference. Besides, *we* have to do it or——

It is good to let off steam and we feel much better now, thank you.

DOROTHY TURNER.

"The Open Window."

DEAR EDITRESS,—I am very glad that you have opened the windows of your column for the ventilation of this very controversial subject.

I am greatly obliged to your correspondent, "Stiff Neck," for her valiant defence of the sterner (?) sex, though it is black shame to us that she should have to stand up for us, in either sense ! ! I am carefully keeping her breezy contribution in the hope that it may prove sufficiently reviving to one of our fresh-air enthusiasts some cold, foggy morning, and so save the rest of us from pneumonia, bronchitis, and all the other cheery concomitants of the ever-open window.

Civilisation, with all its boasted progress, does not seem to have advanced very far in this direction for thousands of years. Probably, Noah had just the same difficulty in gaining unanimous approval as we have. I wonder how he fixed up matters between the Polar Bear and the Salamander ? Poor old Noah !—and he had only *one* window to do it all with !

But, seriously—and this really is a very serious matter—what is to be done about it ? Are we *all* to die of phthisis, pneumonia, asphyxia, and all the rest of the Medical Dictionary, before we qualify for our pensions ? We might, indeed, say then that the case is summed up in the familiar words :

"Those glories come too late
That on our ashes wait,"

and since it seems that 50 per cent. of us will die if a window is opened, whilst the remaining 50 per cent. (I hope my arithmetic is correct) will die if one is closed, perhaps the problem resolves itself into the determination as to which of us is the fittest, and, so, entitled to survive ; and the settlement of this point might, perhaps, be entrusted to a super-sub-committee of the (un) Departmental Whitley Council for their wait-y deliberation.

Before taking such extreme measures, however, it may clear the air a little (and it seems to be somewhat foggy) if I briefly recapitulate the rules which appear to be at present in force regarding ventilation, and it may be that some of your correspondents will be able to suggest some improvements which would save us all from an early demise.

From years of observation, the rules seem to be as follows :—

(1) With cold, biting, north-east winds, open all north-easterly windows, and all doors.
(2) When the temperature is 90° in the shade, close *everything* tightly, and turn on all radiators, &c., to the full.
(3) In a London Particular, open windows until the room is lost in impenetrable darkness ; then close, in case it clears outside.

There are, of course, others—but they are all variations of the above, and I have already trespassed too long on your time, and on your space—so I will hastily bow myself out, and subscribe myself.—Yours sincerely,

"A. TISHOO."

Will the author of "If"—a Parody, published in the October JOURNAL, please communicate with the Editress at the address given below.

Contributions to this column should be addressed : THE EDITRESS, "Talk of Many Things," Telegraph & Telephone Journal, Secretary's Office, G.P.O. (North), London, E.C.

WIRELESS TELEPHONE BROADCAST RECEPTION: THE FACTS.

BY B. S. T. WALLACE (*Central Telegraph Office*).

THE promise of broadcasting was honoured with more attention by the daily press than is usually accorded an innovation. Before any scheme was formulated, columns of descriptive matter and long technical articles were published daily. Broadcast programmes have been transmitted nightly from London, Birmingham and Manchester for some weeks past, and barely more than mention of it has been made by the newspapers. It must not be inferred from this that the subject is merely a seven days' wonder soon to be forgotten. Fleet Street had seen the American papers with their columns of radio copy and formed the erroneous conclusion that history would repeat itself in England. We are slow and sure, and learn from other people's mistakes. Instead of the hopeless chaos prevailing in America, it has been the endeavour of the British authorities to provide for high-class transmissions free from interference. This has necessitated the

Digitized by Google

imposition of restrictions not, *so far*, enforced in the United States, and consequently development over here will be more gradual.

The appeal of wireless telephony is widespread. Thousands of old and lonely people have already, by its aid, been given a new lease of life, and as a cure for fractious children it has no equal. It will prove to be a medium for education even more than for entertainment. Every programme from Marconi House contains a lesson in perfect speech and faultless song. Ideas are more easily absorbed from the spoken word than the printed letter, and the long-familiar phrase, "I saw it in so-and-so," will gradually be replaced by "I heard it over Radio."

A large number engaged in the Telegraph and Telephone Services will, no doubt, feel morally compelled, owing to the competitive interest of less technically-minded neighbours and the urgent entreaties of the younger generation, to take some practical interest in the reception of the broadcasted programmes. To say that valve apparatus can be operated without any technical knowledge is only half the truth; the knowledge and experience are required as soon as a fault develops, which in valve sets is quite certain to happen sooner or later. Perhaps the most useful service will be rendered by indicating a few of the causes of failure, and other pitfalls.

The most likely trouble to appear will be a continuous scraping and crackling sound accompanied by weakening or total loss of signals, due either to a fault in the high-tension battery, or in the transformer or headgear.

The high-tension battery of from 40 to 80 volts is composed of tiny dry cells, usually made up into blocks of eleven or more and sealed with pitch. The little cells are liable to break down unexpectedly owing to irregular chemical action, and the failure or partial failure of one cell, will put the whole receiver out of action. The difficulty, of course, is that the unsophisticated operator has no means of testing his dry battery. It can only be done with satisfaction by means of an accurate voltmeter (an expensive instrument) and a knowledge of what voltage each individual cell or complete section should read when in good condition. A bad fault may be indicated by a drop in voltage of only one in twenty. Another way of testing the battery would be to substitute one known to be perfect. Certain transformers and and the telephone headgear are wound with many turns of wire, finer than a hair. This wire is mechanically weak, and when used in high-tension circuits, is liable to perish from a variety of causes that are still under investigation by the manufacturers. The result is either a complete, or an intermittent disconnexion; a most baffling fault to meet.

If one earpiece of a double headgear becomes disconnected, signals are still received though weaker and accompanied by scraping noises, and a fault in the telephones is about the last thing suspected. Continuity can be tested for by a battery and sensitive galvanometer. This is not entirely satisfactory and might fail to reveal a high resistance fault, where the wire is on the point of breaking or is broken intermittently. Resort must be had to a Wheatstone bridge or a low reading milliamp meter and known voltage, all beyond the scope of the man in the street.

There are other causes of breakdown in valve circuits, many of them an almost hopeless task to find and rectify without considerable experience. Accumulators for heating the valve filaments are spoken of quite casually, whereas they are really the greatest bugbear in connexion with this type of receiver. They soon give trouble if not kept in condition. This necessitates charging every two or three weeks, and the use of an accurate voltmeter for checking the condition of each individual cell. Cheap low resistance voltmeters are unsuitable. A moving coil instrument with a resistance of at least 100 ohms per volt should be used, and the voltage measured with the valves alight. It is not at all an easy matter to get accumulators reliably charged. It is not a paying proposition unless done on a large scale. Many garages do it in a haphazard sort of way by holding the accumulator till a dozen or more of all shapes, sizes and conditions, are ready for charging, with the result that the receiver is out of action for a week or more and the cells probably only half charged when returned. More often than not there are no facilities for charging within a reasonable distance, especially in localities where direct current is not available. Unless money is no object, charging from the house supply is equally hopeless. The valve itself, skilfully used, may last for many years; carelessly handled, not many minutes.

The advent of broadcasting has revived the utility of the crystal detector, and much apparatus employing this device is being marketed. At its *best* it will enable good enjoyable music to be received within 40 or 50 miles of the proposed broadcasting stations. Some difficulty is likely to be experienced with the detector, owing to the great bulk of them being very badly designed, necessitating too much "fiddling about" in the adjustment. The tuning in the cheaper sets is usually done with "sliders," a device moving along a metal rod and making contact with a coil of insulated wire which has been scraped bare in the path of the contact. This system should be avoided, as it is liable to give trouble in a variety of ways. It has the sole merit of being cheap and easy to make.

For the reception principally or solely of the broadcasted music, crystal receivers are recommended, with these reservations:—

Do not purchase an instrument until an opportunity has been given to hear the actual broadcasted music on it, preferably at one's own distance from the broadcasting station.

Avoid all forms of sliding contacts and choose stud tappings or variometers for tuning.

Put the detector out of adjustment to ascertain the ease or difficulty with which it can be readjusted.

The illustration shows a crystal receiver designed by the writer especially for the broadcasted music. The circuits are arranged to compensate for any variation in aerial length between 20 ft. and 150 ft. or more, in view of a possible increase in size of aerial that may be permitted in the future. The correct adjustment of the detector is obtained automatically with facility and certainty by the simple turning of an ebonite thumbscrew, working in conjunction with a special spring device. In practice, readjustment is very rarely needed. On this set, the experimental broadcast transmissions from Marconi House are received clearly on headgear at a distance of 40 miles, and with the Brown microphone amplifier shown in the illustration operating on 6 volts with dry cells, the music is pleasantly reproduced on a loud speaker within a radius of 10 miles. These distances apply with an average good aerial, such as can be arranged with a 20-foot bamboo on the house, and a 50 ft. to 100 ft. length of wire down the garden.

Near the transmitting station crystals can do very well on an inside aerial. A recent test was made on an aerial built in the attic of a small undetached suburban house situated 12½ miles from the above-mentioned station, and made up of twelve short lengths of wire disposed like the ribs of an umbrella. All speech and music was sufficiently loud and clear to be quite enjoyable in three pairs of headgear. Other stations that can be taken on this receiver using a P.O. 100 ft. aerial, are the leading amateurs—some of whom transmit very creditable music, the 600-metre ship and coast stations within a very wide area, and the aircraft telephony ground stations. A very simple modification would intercept Paris time signals. Very little interest is likely to be taken in Morse when the full broadcast programme is working.

It may here be pointed out that providing the apparatus is in order, transmission and reception by wireless telephony is better in every way than ordinary line telephony can ever hope to be, and the reproduction of the human voice and tones of musical instruments, far more perfect than by any other means.

The two methods of reception with either *at its very best* can be summarised as follows:—

Valve apparatus is capable of receiving broadcast telephony at distances up to 1,000 miles, and if required, of amplifying it sufficiently to be audible throughout a large building. Such performances require expert knowledge and wide experience. In its simplest form technical assistance is sure to be required at some time or other. There are appreciable running costs.

Crystal reception of this telephony is limited to about 50 miles. It is exceptionally clear and pure in tone, requires no technical skill to manipulate, and there are no upkeep expenses. Valve amplifiers can be added subsequently if desired. There is no better way of making a practical study of wireless than commencing with a crystal receiver, afterwards adding a low-frequency note magnifier. It is the simplest form of valve circuit to experiment with. Other circuits can be followed up much in the same way as given in the excellent series of articles appearing elsewhere in these columns.

GEORGE FREDERICK PRESTON.

IF the question were asked what is the most harassing and thankless post in London, a fair reply would be "The Controllership of the London Telephone Service," involving as it does such heavy and wide responsibilities. It is not necessary to enumerate them all, but much imagination is not required to realise what they are when it is remembered that the position includes the control of a staff numbering between eight and nine thousand. In addition, there are the accounts of some 160,000 subscribers to be kept and rendered, and the new Directories to be compiled at stated times. Moreover, the Controller has to be continually investigating new methods of improving the Service, while at the same time keeping a close watch on economy. Also it must not be overlooked that he is always at the call of any subscriber who may not be satisfied with the attention received and even at night he may be and is called up. But, onerous as the duties now are, it is doubtful whether they will ever again be as difficult as during the past 22 years, for this period covers the early days of the Post Office Service when competition existed with the National Telephone Company's system.

Then after about ten years of these conditions followed in 1912 by the amalgamation of the Post Office and National Telephone Services, an event fraught with many and complex problems and necessitating the rebuilding of out-of-date exchanges. It involved also the correction of areas and the transfer of subscribers from one exchange to another. After that, the Great War, causing terrible depletion of trained staff, enormous demands on the Service from other Government Departments, and shortage of new material of every description. But now the work in arrears has been made up, new exchanges have been opened, rates have been adjusted, the Toll Service has been initiated, and London has a Telephone Service second to none in the world. During all these years the Service has been under the guidance of G. F. Preston, General Manager, from 1901-1912, Controller from 1912-1923. Mr. Preston had had valuable experience in his earlier life, for in 1880 he joined the Metropolitan Brush Electric Light Company, and subsequently entered the service of the London and Globe Telephone Company,

Digitized by Google

whose business was taken over by the United Telephone Company. After serving with this Company for some time, he went to the Northern Telephone Company with which he remained till 1891.

Copyright.] [*Miles & Kaye, 54, Cheapside, E.C.*

MR. G. F. PRESTON, C.B.E.

When the Northern District Telephone Company was absorbed by the National Telephone Company, Mr. Preston was transferred to the management of the Sheffield District, and was subsequently appointed in 1896 to be the Superintendent of the Southern Province. It was while acting in that capacity in 1901 that he was offered and accepted the position of General Manager of the Post Office London Telephone Service then about to be started. Mr. Preston thus brought with him a wide experience, but more than that, a broad vision and a dogged determination to make the Service a truly public one and one worthy of the Empire's capital. His quickness in detecting weak points, his readiness to adopt new ideas, his geniality, his ability to deliver an appropriate speech on any occasion, his love of sports, in some of which he still takes an active part, are all indicative of the man. But he needs no words of praise, for his record stands and his name will always be associated with the London Telephone Service for which he has worked so hard and to which he has devoted the best years of his life. *Ave et Vale.* L. A. P.

THE NEW CONTROLLER OF THE LONDON TELEPHONE SERVICE.

THE Postmaster-General has appointed Mr. W. A. VALENTINE, Controller, in the place of Mr. G. F. Preston, C.B.E., who retires. Mr. Valentine has had a long experience of telephone work. He has risen through various grades of the National Telephone Company to the rank he has now attained. At the time of the transfer he was District Manager in charge of Glasgow. In a few months he became one of the three officers who held the position at headquarters of Provincial Superintendent. His colleagues were Mr. Dalzell, now Director of Telegraphs and Telephones, and Mr. John Scott, now Postmaster of Birmingham. The functions of the Provincial Superintendents were advisory in order to help over the transition stage and when a more definite organisation was constructed Mr. Valentine became Deputy-Controller of the London Telephone Service. From the point of view of one who had spent his life-time in the Post Office service

Copyright.] [*Miles & Kaye, 54, Cheapside, E.C.*

MR. W. A. VALENTINE.

and was thrown into intimate relations with the three Provincial Superintendents, it was a great gratification to find how wide a vision they exercised and how carefully they thought of all the various considerations to be taken into account in adapting the Telephone Service to its new conditions.

Attractive in personality, clear in judgment and sensitive to the influences on character which any large organisation is bound to exercise, he will continue his wide outlook on men and affairs and seek a progression in efficiency which is founded upon those personal relations which are strengthened by mutual confidence and enlightened by wide-reaching discussion. It will probably be his lot to be at the head of the London Telephone Service at the period of its greatest growth, and he will meet that growth with a conception of public service which takes no narrow vision of duty and is never indifferent to opportunities as they may present themselves of developing the dependence of the public on the means of communication for which he is responsible. In the present days of readiness on the part of the public (and of that portion of the articulation of the public which falls to the newspapers) to criticise all efforts which are made by public departments, Mr. Valentine will be found as ready to learn as he is to defend. Such criticism is often mixed of diverse elements. There is in it at times a substratum of truth from which lessons in administration can be learned, and it is not always wise to take up an attitude of resentment. At the same time there are misconceptions to be cleared away and misunderstandings to be corrected. The staff may rely upon Mr. Valentine not to be lacking in his duty in these particulars. He has been associated with the direction of this JOURNAL for a number of years. In that aspect of the responsibilities which he has accepted he has been both helpful and enlightening and a sound and trusty counsellor, and those associated with the conduct of the JOURNAL hope that he will long continue to give them the benefit of an experience which is as wide as the sympathy with which that experience is invariably interpreted.

VOL. IX. FEBRUARY, 1923. No. 95.

A TELEPHONE CALL FROM AMERICA.

JANUARY 15, 1923, as Mr. Gill, the President of the Institution of Electrical Engineers, announced to the members of the Post Office Telephone and Telegraph Society of London, will be a notable day in telephone history, for in the early hours of that day, to quote Mr. Gill's words, "the first, definite, good-quality, pre-arranged telephone message from the United States" was received in London. Wireless telegraphic transmission across the Atlantic is no new thing, and we hear of possessors of wireless receiving sets in the suburbs of London listening to concerts at Schenectady, New York, but the clearly-transmitted telephone message of Jan. 15 marks a development of which no one can foretell the outcome. It clearly establishes the practicability of exchanging speech between Gt. Britain and the United States. There are many difficulties, financial as well as electrical, to surmount before a telephone service across the Atlantic can become what is termed a "commercial proposition," and indeed it may never develop to that extent; but the interchange of speech, once established, even under conditions of restriction as to its use, will make a powerful addition to the growing number of chains which bind together the people of this country and the people of the United States.

TELEPHONE DEVELOPMENT AGAIN.

THE annual summary of the telephonic development of the world which we publish in this issue presents no novel features. It shows that at the end of 1921 there were in existence about 21,800,000 telephones in all, of which North America claimed 14,880,000 and Europe 5,560,000. It is perhaps hardly to be expected that Europe which suffered and still suffers so heavily from the war should have made any perceptible progress in the task of diminishing the commanding lead of America in telephone development. It will be seen that Great Britain just failed to reach the million in 1921, that figure being passed in the January of 1922. The year under review was, owing to trade conditions, an unfavourable one for this country, and only 11,000 stations were added, but 1922 showed a net increase of 65,000 stations, and 1923 is expected to show a gain of at least 75,000. Denmark alone of the countries of Europe has a development at all comparable with that of the United States, showing a ratio of one to every twelve inhabitants. Sweden shows no apparent progress for a well-understood reason. Duplicate connections in Stockholm have been gradually diminishing since the amalgamation of the Company's system with that of the State, and although there is probably an increase in the number of telephone users, there is an actual decrease in the number of stations.

It is worthy of consideration whether the number of telephone stations expresses the development of a country as accurately as the number of telephone lines. The former unit is that most commonly adopted in the telephone world, but the ratio of stations to lines varies considerably in different countries. In some few European states the extension stations form a third of the whole, in some a quarter, in others sixth, even less; in this country they are two-fifths, but in America the position is far different. In a New York exchange which was recently converted to automatic working, we learn that there were 7,765 extension stations to 1,088 lines, and whilst not assuming that this extraordinary ratio is typical of the whole of North America, it is certain that hotels, department stores and offices in which extension stations are counted by the hundred are common in all large American cities. It is obvious from this that to say there are 9 or 10 inhabitants per telephone in North America does not connote quite the same thing as to say there are 38 inhabitants per telephone in Western and Central Europe. There must be hundreds of thousands of telephones in America which are not installed for the use of any particular "inhabitant" but for the use of transient guests and customers, and the average of 8 persons per telephone in the United States does not therefore mean (as it suggests at first blush) that practically every head of a household is connected with the exchange system. It may, of course, be protested that an average is only an average, that in Europe also there are large hotel and office installations, that one man has a dozen or more telephones which go to improve the general average; all that we contend is that the difference between the average and the actual figure is much greater in America. We do not seek, however, to extenuate the poor development of Europe. We are well aware of the advantage both to business and to social life of liberal and adequate telephone installations in stores and hotels, and realise that their multiplication is all to the good. We know there is a great field for development in the private house telephones, and in all these directions our keenest efforts will be addressed in the coming years.

THE RIGHT HON. NEVILLE CHAMBERLAIN, M.P.
H.M. POSTMASTER-GENERAL.

I send my hearty greetings to the Telephone and Telegraph Staff and trust that the year will bring happiness to them and increased progress in the great undertaking with which we are connected.

NEVILLE CHAMBERLAIN.

HIC ET UBIQUE.

MR. W. A. VALENTINE, lately Deputy-Controller, has been appointed to the Controllership of the London Telephone Service, filling the vacancy caused by Mr. PRESTON'S retirement at the end of last month. We refer more fully to both gentlemen elsewhere in our columns. Mr. W. H. U. NAPIER (Inspector of Telegraph and Telephone Traffic, Headquarters) becomes Deputy-Controller, and Mr. J. F. EDMONDS (Assistant Controller) is transferred to Headquarters as Chief Inspector of Telegraph and Telephone Traffic. Mr. M. C. PINK becomes Assistant Controller, L.T.S., and Mr. W. D. STEWART, Inspector of Telegraph and Telephone Traffic (Headquarters).

WE learn from the Press that the French Chamber of Deputies has negatived by a vote of 397 to 70 the proposal to hand over the State telephone system either wholly or in part to private enterprise.

AUTHORITY has been given for the opening of telephone exchanges in Kirkwall and Stromness in the Orkneys, the first to be opened in those islands. They will obtain trunk communication with the mainland, limited at present to Thurso and Wick.

WE understand that the Indian Government Telegraphs Department projects the establishment of trunk lines between Bombay and Calcutta, and Bombay and Delhi. Three or four repeater stations will be required on the former line. They are expected to be completed in about 12 months.

With regard to experiments to find out the longest distance which can be spanned by a continuous trunk line without an intermediate repeater installation, says the *Westminster Gazette*, conversations have been carried on between Bombay and Nagpur (520 miles), and Bombay and Ratlam (410 miles). Conversations over these distances was not heard distinctly enough for commercial purposes, although conversation was found possible.

The next longest distance trunk is that between Bombay and Ahmadabad, about 315 miles, and this has proved a complete success as regards distinct hearing.

A WEEKLY journal gives the following valuable "Telephone tip":—

A society friend of mine, anxious to soften the sound of her telephone bell which tinkles all day with appointments, applied to the London Telephone Service. A representative called, solemnly examined the instrument, and regretted that nothing could be done. After he had left, my friend inserted a piece of blotting paper between the bell and the connexion, and her bell now makes a delightful, soft, whirring sound

If the delightful, soft, whirring sound cannot be heard from an adjoining room the society's person's line will be reported: "No reply." Later she will protest indignantly that she was within call all the time, and an altogether abandoned Telephone Service will be blamed.

MR. J. M. KEYNES' complaint in the *New Statesman* of the abuse of the private house telephone attracted a good deal of attention in the Press. He says:—

"At no time during the day can I rely on a quarter of an hour's uninterrupted work. Any unconcentrated person who finds it easier to ring up than to write a postcard, any hostess making up her party, any American tourist to these shores who thinks he would like a few words with me, is entitled by the existing conventions, *and is able*, suddenly and at any hour, to interrupt my business and make me attend to theirs."

Much as for general reasons we desire to see an increase in residential traffic, we admit that Mr. Keynes has just cause for complaint. Indeed, it is the action of people such as he mentions which militates decidedly against the extension of the telephone amongst private people. Mr. Keynes considers that a code of manners for telephone users is required, that a stranger should have no more right to use the telephone of a private house than to open the front door, and that it should be bad manners, except amongst intimate friends, to issue an invitation on the telephone, which gives the guest no time, without apparent rudeness on his part, to consider whether he is really free, and whether he wants to accept.

The *Daily News* cynically suggests that a simple remedy is to hang up the receiver and let the telephone operators bear the blame for the interruption of speech.

A COLLABORATOR has been moved, not so much from a desire to burst into song, as with the aim of rendering mnemonic assistance in a good cause, to indite the following:—

CODE OF TELEPHONE MANNERS.

Use not thy telephone to thrust
Thy personality
Impertinently through the crust
Of English privacy.

Thou wouldst not suddenly intrude
In inner chambers where
Celebrities sit coy and brood—
Unless first bidden there.

Thou wouldst not force an office door
To interrupt a friend
In private converse, like a boor,
To gain some instant end.

Why then thy telephone employ
With underbred insistence,
And Publicists or Peers annoy
In safety from a distance?

Digitized by Google

No; in the interests of the famed
(And not for them alone)
A Code of Manners should be framed
For those who telephone.

Thou shall not wantonly ring up
A stranger to divine
His views upon the Football Cup,
The Ruhr or Palestine.

No Scribes or Statemen shall be vexed
In their exiguous ease
To make a fourth at Bridge, perplexed
By sudden messages.

Bishops thou shalt not take to task
For dicta on Divorce,
Nor noble race horse-owners ask
The odds upon a horse.

Nor beg a Dean, a gloomy one,
Decide: "Should Cousins Kiss?"
For who can solve by telephone
Conundrums such as this?

Thou shalt not urge that Bonar Law
"Tranquillity" define,
Nor seek to know of Bernard Shaw:
"Is Drama in Decline?"

The telephone to men of sense
Has proved a constant aid.
'Tis not a crude impertinence
'Tis not a weapon of offence
And should not so be made.

W. H. G.

GENERAL FEATURES OF THE ANGLO-CONTINENTAL TELEGRAPH SERVICE SINCE THE WAR.*

BY J. J. TYRRELL.

I HAVE met with two difficulties in writing this paper. They are:—(1) the superabundance of material, and (2) the difficulty of writing of post-war matters without touching the war period. In the case of the latter there is no clear cut line of demarcation between the war and peace periods, and one is forced to touch upon the war and even pre-war events to obtain the correct perspective. This paper, then, practically amounts to a continuation of that which I had the honour of giving before this Society in March, 1914.

To open my subject intelligently one must perforce first give a rapid review of the actual war conditions, as those conditions affected Anglo-Continental communications. Had anyone conceived a contempt for the importance of Anglo-Continental telegraphs *prior* to the war, that contempt should surely be replaced by respect in 1922. The enemy at any rate did not so under-estimate its potentialities, as his fairly frequent night visits to the neighbourhood of St. Martins-le-Grand very clearly indicated. On separate occasions bombs were dropped to the north, the south, the west and the east of us, and finally struck us, though not fatally, one beautiful Saturday morning, July, 1917.

In order to epitomise the history of the war period, the following C.T.O. War Calendar will give a condensed history of the fateful four years.

WAR CALENDAR OF EVENTS DIRECTLY AFFECTING BRITISH TELEGRAPHIC COMMUNICATIONS WITH EUROPE.

July 28, 1914.—Austria declares war against Servia.

„ 31, 1914.—Germany cuts Indo-European Company's telegraph lines with Karachi. Provisional censorship instituted in London.

Aug. 1, 1914.—Germany declares war on Russia and on France.

„ 3, 1914.—Telegraph and telephone communication between Germany and Belgium cut. Censors installed in Cable room.

„ 4, 1914.—8.46 p.m.—Following telegram received from Berlin:—"German Embassy, London. English Ambassador just demanded his passports shortly after 7 o'clock, declaring war.—JAGOW."

„ 4, 1914.—9.40 p.m.—Working of all wires to Germany ceased. 10.30 p.m.—Berlin requested London to reserve a wire for diplomatic correspondence. This done, but 11 p.m. (London time) no further communication from German side. War commenced.

* Paper read before the London Telegraph and Telephone Society, Dec. 18, 1922.

The censorship mentioned under date Aug. 3, 1914, was extended to all the telegraph companies whether working cables to Europe or elsewhere, so that the Great Northern Telegraph Company, with its ramifications in Norway, Sweden, Denmark, Russia and beyond; the Eastern Telegraph Company with its European and world-wide network, as also the American Cable Companies, were all placed under military control.

MAP SHOWING INDO-EUROPEAN TELEGRAPH CO.'S LINE.

The Indo-Telegraph Company's circuits, as you will have noted, were cut by the German Authorities some few days before war was actually declared, thus severing important communications with Russia, Persia, and India. These wires passed through Emden and Berlin, and had always been carefully watched at the latter two points, as anyone interested would have easily noted when visiting these German offices. I think the circuits are the longest Wheatstone circuits in the world and, when on occasions, one of them has been extended to Calcutta, it has successfully worked through nine repeaters. The section between Warsaw and Teheran has recently been restored and we are now waiting for the restoration of the remaining section between Warsaw and London. The route of these lines is a very interesting one and passes through Lowestoft, Berlin, Warsaw, Odessa, the Crimea to Kertsch, thus by cable to Jaman in the Caucasus, to Tiflis, Tabriz and to Teheran. Here the Indo Companies and the British Indian Government staffs are in the same office and here, too, the Indian Government takes over

VIEW OF CABLE ROOM, C.T.O. LONDON, LOOKING SOUTH.
(Dutch, Belgian and German circuits.)

control. This diary of the foreign section of the Central Telegraph Office, known as the Cable room, is the diary of the ebb and flow of the Allies' fortunes. This view gives a rough idea of a portion of the room in question. The severance of telegraphic communication between Germany and America, the abandonment of Brussels, the removal of the French Government to Bordeaux, the laying of a new cable giving communication between London and Nantes to meet this new situation and its possibilities, the interruption of the London-Antwerp circuits, the laying of another new cable giving communication, this time between London and Dunkirk, the return of the French Government to Paris because of the improved military situation and with this return the re-allocation of emergency circuits, all were bound up with the magnificent work of the engineers of the British Post Office and their struggles to maintain communication between this country and the continent.

Digitized by Google

It is probable that the Press of this country were vaguely aware of something in the nature of cable laying, about this time, but whatever it may have been it resulted in a ludicrous report that the enemy had been

GERMAN CABLE STEAMER "STEPHAN" LAYING THE SHORE END OF THE MUNDESLEY-NORDENEY CABLE 1913.

laying secret cables on the East Coast. I have not the cutting at hand but one imaginative journalist pictured a Teutonic boat laying a "secret" cable on Mundesley Pier. Those who know Mundesley will appreciate the exactitude of the information and the wonderfully imaginative details of the landing place! The picture which follows will enable the reader to appreciate how much secrecy there was in the whole of the proceeding, which took place of course before the war, the German Government manufacturing and laying the cable by agreement with the British Government and the latter paying their quota of the cable cost. In the offing is seen the German cable ship *Stephan*, date 1913. From this photograph we can readily estimate the chances of enemy craft landing a deep sea cable in war time on an *enemy* coast without being detected.

WAR CALENDAR 2.

Aug. 5, 1914.—*Before dawn*: German cables to America cut in English Channel.

„ 20, 1914.—Brussels abandons chief telegraph office as enemy approaching, communication cut to Paris.

„ 30, 1914.—All London wires to Paris *via* Boulogne and Calais interrupted.

Sept. 3, 1914.—French Government removed to Bordeaux.

„ 16, 1914.—New cable laid from Beachy Head to Nantes.

„ 27, 1914.—Communication with Paris, *via* Boulogne and Calais, partially restored.

Oct. 8, 1914.—Communication with Antwerp ceased.

„ 10, 1914.—Dover - Dunkirk cable laid.

Jan. 19, 1915.—Cable ship *Colonia* completed laying of Anglo-Russian cable.

„ 28, 1915.—Anglo-Russian cable opened for traffic.

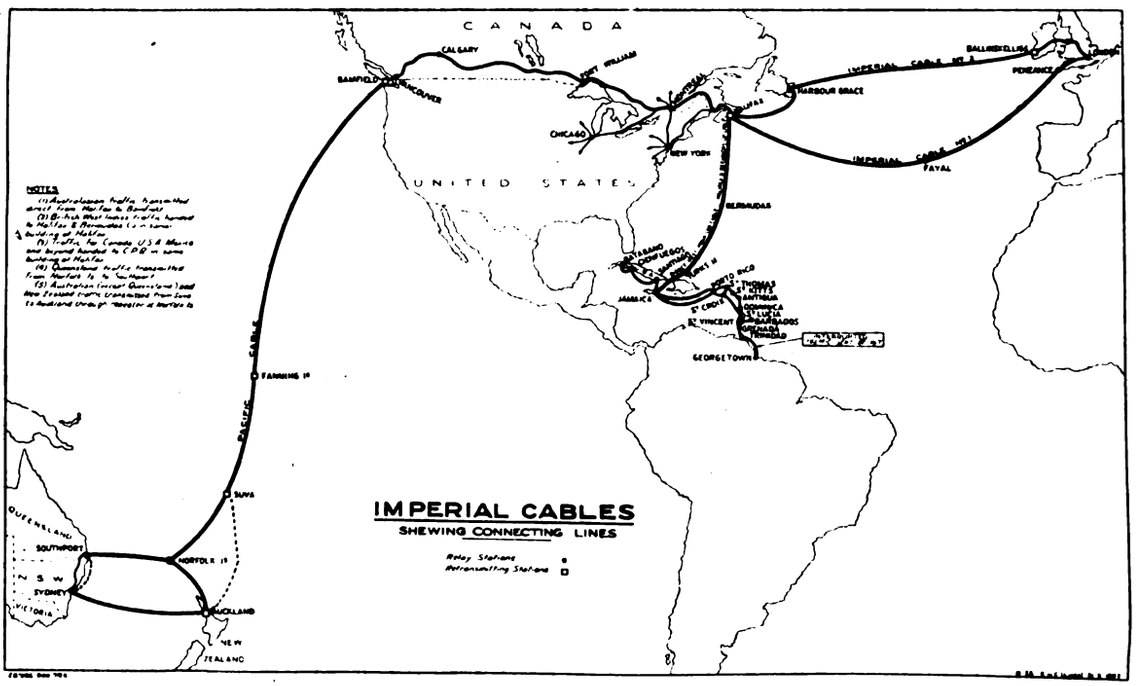
Jan. 17, 1916.—New six-core cable laid to France *via* Dungeness and Gris Nez.

July 18, 1917.—New Anglo-Canadian (London to Halifax) cable opened for traffic.

July 7, 1917.—C.T.O. bombed.

Sept. 6, 1917.—New Cuckmere-Havre cable laid.

Nov. 11, 1918.—Armistice.



1915 opened with one of the finest of the many fine feats performed by the engineers, the laying of the Anglo-Russian cable, ably aided by experts loaned by the Eastern Telegraph Company. The cable was worked for the remainder of the war period by the Eastern and P.O. staffs, the British staff controlling both the Russian and the London ends and initiating the Russian telegraphists into the technicalities.

In 1916, owing to the need for more communications with France, the P.O. engineers laid yet another new cable, this time a six-core length between Dungeness and Gris Nez. It is obvious that these feats could not have been performed without the aid of our Navy, and if anyone needs excitement let him try cable-laying and repairing in war time.

Here in England the same year you will recall that we were visited by one of the most severe snow storms which have ever struck our communications, uprooting literally thousands of poles all over the country. These were not very easily replaced, but despite a depleted staff the more important circuits were again working in a few hours, or special arrangements were made, as in the case of the Anglo-Dutch circuits, to work the cables themselves from the nearest coastal point.

1917 saw the laying and installation of the first Government-owned Trans-Atlantic cable, London to Halifax. This cable, as is known, was actually a war-prize. It is marked on the map as Imperial Cable No. 2. Imperial Cable No. 1 is the ex-Direct United States cable which was purchased from the company after the war. The eastern end of the latter has now been brought round from Ballinskelligs to Penzance as a more convenient and economical cable station. During the war, therefore, and under super-difficulties, an all-red route across North America to New Zealand and Australia was thus actually realised. Contracts are at the moment out for the manufacture and laying of two additional cables between Suva and Auckland, and Southport and Sydney, as shown on the following map by the dotted lines. The use of a submarine cable to cover the *land* distance between Sydney and Southport is due to the instability of the land route owing to physical difficulties. The respective lengths of these two cables are 1,313 and 539 nauts.

The same year saw a third new cable laid to France owing to the needs of the American Military and Naval Forces, viz., one from Cuckmere (Sussex)

to the Port of Havre. The event of July 7, 1917, has doubtless not escaped the attention of my audience, and as a memento of that occasion, photographs were taken by one of the C.T.O. staff not very long after the bomb fell through the roof and were reproduced in the pages of the T. AND T. JOURNAL. The time between the departure of the last member of the female staff from the damaged section of the building and the falling of the bomb was only measured by a few minutes.

The following tables will give some idea of the variety of circuits which were maintained for military, naval, transport and diplomatic purposes :—

LIST OF CROSS-CHANNEL WAR EMERGENCY LINES UNDER CONTROL OF THE CABLE ROOM, C.T.O., 1914-1922.

Description of Line.	Date of Opening.	Date of Closing.
Admiralty—Paris Marine	Aug. 8, 1914.	Sept. 18, 1914.
„ Bordeaux Marine	Sept. 19, 1914.	Dec. 7, 1914.
„ Paris Marine	Dec. 7, 1914.	Sept. 1, 1919.
„ Dunkirk	Oct. 5, 1914.	June 1919.
War Office—Paris Guerre	Aug. 9, 1914.	Sept. 2, 1914.
„ „ Havre	„ 10, 1914.	„ 14, 1914.
„ „ Le Mans	Sept. 9, 1914.	Dec. 5, 1914.
„ „ Dunkirk	Oct. 1, 1914.	Oct. 14, 1914.
French Embassy, London—Paris Affaires Etrangères	Aug. 12, 1914.	Sept. 4, 1914.
„ „ „ Bordeaux „	Sept. 4, 1914.	Dec. 9, 1914.
„ „ „ Paris „	Dec. 9, 1914.	Sept. 2, 1919.

Direct wires from the British Admiralty, War Office and French Embassy in London, were respectively connected with the French Admiralty, the French War Office, and the Quai D'Orsai in Paris, in the very early days of August, 1914. Owing to military pressure upon the French capital, the French terminals of these circuits had to be extended to Bordeaux less than a month later.

The tide of battle swinging for a while in favour of the Allies these communications were again restored to Paris in December of the same year.

WAR EMERGENCY, No. 2.

Paris—Antwerp *via* London	Aug. 25, 1914.	Sept. 2, 1914.
War Office—Boulogne	Oct. 7, 1914.	June 1914.
„ „ Abbeville	„ 7, 1914.	Oct. 1, 1918.
„ „ Ostend	„ 8, 1914.	„ 13, 1914.
„ „ G.H.Q., France	„ 9, 1914.	June 1919.
„ „ Havre	„ 11, 1914.	Oct. 15, 1919.
„ „ G.H.Q., Folkestone	Nov. 30, 1914.	Dec. 15, 1917.
„ „ Rouen	Dec. 5, 1914.	June 13, 1919.
„ „ Dieppe	Jan. 2, 1915.	Feb. 11, 1917.
„ „ Etaples	July 16, 1916.	Dec. 15, 1916.
„ „ Calais	Feb 4, 1917.	„ 4, 1919.
„ „ G.H.Q.A., 2nd wire	April 1, 1917.	Nov. 1, 1919.

On Aug. 25, 1914, the lines between Belgium and France were cut, but a circuitous line was made up from Paris, *via* Calais, Dover, London and Ostend to Antwerp. This was interrupted by the capture of the Belgian Port on Sept. 2, 1914. It is a curious piece of war history, but despite the devastation of Belgium and its over-running by the enemy, and although only by one very slender thread, practically, telegraphic communication by cable between London and Belgian territory existed right through the war. To be exact there was one small office, the Furnes cable hut on the Belgian coast, with which we were always in telegraphic touch night and day. This little spot was repeatedly bombed from above and bombarded from the sea but the Belgian telegraphists never budged.

In addition to the War Office connexions just shown we were frequently switched through to our own various armies in France, and at times in Italy. Not infrequently the French H.Q. needed us, and occasionally the Italian. Here are a few more circuits :—

WAR EMERGENCY, No. 3.

War Office—Wimereux	Oct. 1, 1918.	Mar. 10, 1919.
Newhaven—Boulogne	Aug. 9, 1914.	Sept. 29, 1914.
Southampton—Havre	„ 9, 1914.	„ 5, 1914.
C.T.O. (Cable Room)—Nantes	Sept. 16, 1914.	Jan. 13, 1920.
„ „ „ Dunkirk	„ 25, 1914.	Aug. 20, 1920.
„ „ „ Furnes	Oct. 15, 1914.	April 1919.
„ „ „ Alexandrovsk ...	Jan. 28, 1915.	Still in service.
„ „ „ Grand Quartier Générale Française	Sept. 24, 1916.	July 1919.
American H.Q.—Havre—Paris—London 5 lines	Dec. 16, 1917.	July 1919.

It was through these various circuits that, day and night, the details of the departure and arrival of transports and hospital ships were announced, and over these lines for hours together high-speed Wheatstone mercilessly chattered out its long lists of torn and shattered humanity, to the monotonous tune of human agony.

It was through these same media that, despite all the stress and imperative needs of the war itself, officers and privates alike were brought home for a few brief days on special leave on account of matters of urgency at home, sometimes in as tragic circumstances as those obtaining in the fields of France. By the middle of 1917 there was an immense increase of traffic largely due to the activities of the United States, so that by mid-December there were five direct lines from the American Headquarters in London with Havre and Paris.

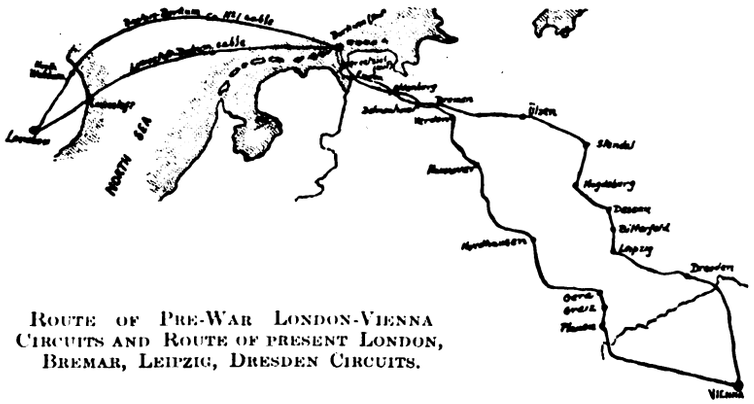
The hurried recitation of these facts brings me to the main theme. The mere naming of these circuits may not convey much to the man in the street. He is not in a position to realise that, during the whole period of stress and strain, private and civil needs were by no means neglected. It is true that anything in the nature of a privately worked telegraph circuit abroad was taboo, but the Press, those gentlemen of short memories and ungrateful hearts, were still able to publish their simultaneous editions in two countries and on two Continents, thanks to the labour, the devotion, the skill and the doggedness of those "terrible people" the Government officials, for the most part, humble men and women telegraphists.

As a supplement to the war—emergency lists—the following is a record of ten more interesting circuits which again show how closely European and our national history were still bound up with G.P.O. West, at what may be termed the armistice stage of relationship with the Continent.

C.T.O. (Cable Room)—Paris Hotel Astoria	Dec. 14, 1918.	Dec. 6, 1919.
Ministry of Commerce, London—Paris ...	Feb. 19, 1918.	Sept. 20, 1921.
London—Cologne Civil Office ... ... *Via* Military line through France opened for telegrams to civilians in German territory occupied by British.	April 16, 1919.	
London C.T.O.—San Remo Peace Conference	April 12, 1920.	April 28, 1920.
„ „ Spa (Belgium) Peace Conference	July 3, 1920.	July 17, 1920.
London Savoy Hotel, C.T.O., to Berlin Foreign Office	Feb. 27, 1921.	Mar. 8, 1921.
London C.T.O.—Cannes Supreme Council Conference	Jan. 4, 1921.	Jan. 11, 1921.
„ „ Genoa Peace Conference...	April 10, 1922.	May 19, 1922.
Also London Foreign Office—Genoa	April 10, 1922.	May 19, 1922.
London C.T.O.—Lausanne	Now sitting.	

In addition to the above there were two emergency circuits of particular interest which became necessary during the war and for some considerable period after the Armistice. Two important submarine cable communications, the first from Fano (Denmark) to Calais, which gave direct connexion between Fredericia and Paris, became interrupted somewhere in the North Sea, cutting France off from the whole of Scandinavia. The British telegraphs came to the rescue, however, and a direct wire was made up *via* Newcastle, London, Dover and Calais, and thus to Paris for the French Government and the Great Northern Telegraph Company. In the second case the shortage of cables between this country and the Near East was at one time specially serious, but the situation was again very considerably ameliorated by an emergency line arranged by the C.T.O., in co-operation with the French and Italian Governments. The route taken by this circuit was London, Boulogne, Paris, Lyons, Turin, Rome, thence to the south of Italy, where a short submarine cable near Scylla and Charybdis took the line into the island of Sicily. Here a further length of cable connected with the Eastern Company's system in Malta. That circuit, made up of a number of various odd gauges, lengths and qualities, was worked by the Company at about 25 words per minute.

An audience of experts will quickly realise that the make-up and the constant changes necessitated by the varied military needs, and more especially the constant bombing and destruction of sections of these communications on the Continent, demanded an equally constant re-allocation of conductors, the break-down of civil circuits to make up military ones, and again the selection of the best that remained for war purposes, leaving the faulty and poorer conductors for civil traffic. Now this constantly recurring process naturally resulted, at the end of the war, in deteriorated line conditions in all belligerent Continental countries. To these must be added the financial situation and the very subtle factor of the general acceptance of lowered electrical and manipulative standards of efficiency, from which not one of the Continental belligerents has yet recovered.



We stand alone here in England as the only European Power other than neutrals whose telegraph system has recovered from the war effects, at least measured by electrical standards. This is no attempt to boast, for we have to thank our insular position in no very small measure for our safety. Manipulatively we are not yet back to pre-war standards, a fact which is due to the heavy flow of young telegraphists since the Armistice and an appreciable amount of nerve trouble due to shell-shock and other war effects which have affected many of those who have returned from the various war areas.

The absolute re-orientation of European political geography has been a factor with which any dealings with Anglo-Foreign telegraphs must necessarily be most closely associated.

That re-orientation has not finished apparently, judging by the questions which have latterly demanded settlement. Even the "Victory" Atlase are already obsolete. The most concise map of altered Europe I have seen is one that has been drawn for the use of the Cable room by a late member of our staff, Mr. Binder. This was out of date a month or two after it was published in the T. AND T. JOURNAL of January, 1922. The cartographer himself has gone to his reward—by being transferred to the A.G.D. The uninitiated may ask: "What difference does all this re-arrangement of States and countries make to the telegraphs?" I have no doubt but that members of the A.G.D. could expand themselves on this point, and that extensively. With ourselves it has altered the location of centres of traffic; some like Magdeburg, before the war a busy centre of the sugar industry—do not now send us a twentieth of their former traffic. Vienna, with which capital we formerly had two busy wires now has not enough to supply one

Digitized by Google

line. On the other hand Praha has an increasing quota and needs additional channels as the capital of the new State of Czecho-Slovakia and is actually an extension of one of the old London-Vienna circuits.

ROUTE OF PRE-WAR LONDON-VIENNA CIRCUITS AND ROUTE OF PRESENT LONDON, BREMAR, LEIPZIG, DRESDEN CIRCUITS.

We are now waiting for a direct wire to Warsaw, which I hope Germany will be pressed to give very soon.

The changing over of territory and the self-determination of emerging new nations and the revival of old nationalities has given us a host of alterations of names certainly unrecognisable. The few shown on the screen will give a good idea of the nature though not the extent of such alterations :—

Even Ireland spells Queenstown Cobh nowadays, and Kingstown as Dunlaoghaire !

These changes have meant that our circulation of telegrams has had to be re-constructed and re-learnt, so that even our most experienced officers have been heavily handicapped and have had the task of learning to forget the acquired knowledge of years.

The conditions of the countries, Allies and ex-enemy alike, with which we are in direct telegraphic communication, is another factor. It takes at least two to work a telegraph circuit and the mental outlook of the man at the other end of the circuit can make or mar the output of the finest and the most expensive apparatus. For example :—In order to increase the output of certain wires, keyboard perforators with automatic transmitters have been tried with certain countries. On more than one occasion, when, owing to the persistent and increasing flow of signals it has been realised by the foreign receiving telegraphist that a machine was automatically pumping telegrams into him, we have received such interruptions as "Stop, stop, take that devil away !" Naturally endeavours were made to continue with the economical device, but persistence on our part was met by numerous and transparent excuses at the Continental end until slower methods were adopted. In the special direction where we have been met with the maximum opposition of this type, it is only fair to say that there are now evidences of real progress.

Since the war, too, the turbulent condition of States and people has been reflected in the fitful manner in which circuits are worked. A little while ago we lost touch with a foreign city for a few minutes, then received the words : "Wait, sir, the police are fighting in the office." Silence for perhaps half-an-hour, when once more our correspondent gave attention with : "Continue, comrade, we have thrown the gendarmes into the street !"

During the war itself a number of the more senior of our male telegraphists were employed in assisting military censors. The work done by these general body men, to my mind, has never received due acknowledgment. Most of the censors were generous enough to admit that their own knowledge of business terms and business methods was very meagre, and that without the help of the experienced telegraphist they would have floundered hopelessly. One dear old chap was one day discovered searching among a list of *metal* merchants for the name of a firm said to be dealing in coprah. Another thought he had discovered a secret code in the text of a telegram which read : "South African bastards are in good demand and good welting bellies are rising." It was a telegraphist well versed in International market phrases who convinced him of the harmlessness of this common term amongst wholesale leather merchants.

Most of my audience have heard of the censor who cut out the quotation : "The captains and the Kings depart" because it was thought to refer to the departure of certain officials.

I have never yet seen it recorded, how one officer stopped a telegram addressed to the name of *Barclay* because "it contained so many figures." It appears that he had associated the name of Barclay with the brewery and had never thought of the banking interest of that name.

The assistance rendered to the military in this and other ways did not help the Anglo-foreign telegraphs, but the women of the C.T.O., augmented by a number of refugee Belgian telegraphists, plus certain temporaries, assisted in filling the places of the "above-age" male telegraphists loaned for this purpose, and also filled the places of the many telegraphists who were performing telegraph duties under decidedly less comfortable conditions somewhere in France, Italy, East Africa, &c., in the trenches and in aeroplanes. Naturally these conditions continued long after the Armistice, and with these conditions continued the daily block of Government and private traffic. Owing to the necessary censor restrictions registered addresses had been abolished and telegrams were written *en clair*. This meant that the average length of a telegram was twice that of pre-war times. Right through the war the C.T.O. generally, but the Cable room with its foreign circuits more particularly, never ceased its labours throughout the 8,760 hours of the year. For days, and even weeks on end, the traffic was endless. One day's traffic was seldom disposed of before its successor was pouring in upon us.

Gradually, however, communications became restored. Temporary land-lines were erected abroad, and submarine cables, maimed by exploding mines, and severely damaged by heavy electrical charges of the enemy were once more placed into service.

POST-WAR CALENDAR 1.

April 16, 1919.—Communication with Antwerp re-opened *via* Amsterdam.

„ 18, 1919.—Communication with Brussels re-opened *via* Calais and Dunkirk.

May 7, 1919.—Direct communication restored with Brussels.

„ 15, 1919.—Telegraphic communication with the Hague.

June 28, to July 16, 1919.—Exchange of British and French staffs between London and Paris offices.

July 23, 1919.—Censorship removed.

„ 29, 1919.—U.S. hand over Cuckmere-Antifer cable to British Government.

Aug. 21, 1919.—Direct communication restored with Antwerp and Brussels by means of repaired Dover-Lapanne No. 2 cable.

„ 23, 1919.—Direct working with Berlin and Hamburg resumed *via* Bacton Borkum No. 1 cable.

Sept. 3, 1919.—Direct working restored with Zurich.

„ 15, 1919.—Liverpool-Havre direct wire restored.

Oct. 17, 1919.—Direct wire with Berne opened.

Nov. 4, 1919.—Direct communication with Geneva.

„ 10, 1919.—Newcastle-Paris wire given up, Fano-Calais cable restored.

Dec. 16, 1919.—French telegraph communication re-opened with unoccupied Germany.

On April 16, 1919, communication with Antwerp was obtained *via* Amsterdam. Two days after, a wire to Brussels was put through *via* Dunkirk ; on July 23 the censorship was removed, and a month later direct wires were established *via* North Walsham and Emden with Berlin and Hamburg. The remaining items have obvious interest as indicating further restorations towards the normal.

The re-opening of the German circuits was a delicate matter, but by strictly official courtesy on both sides "incidents" were conspicuous by their absence. One of the first business telegrams sent to a well-known Hamburg firm was : "Do you still deal in sausage skins ?" Strange to say we were still "at war" with Germany.

POST-WAR CALENDAR 2.

Jan. 10, 1920.—Official date of termination of war.
April 9, 1920.—Newspaper special wire services resumed.
„ 12/28, 1920.—Special Peace Conference wire, London-San Remo.
May 8, 1920.—Communication with Bale opened.
„ 23, 1920.—Eastern Company's Belgian cable restored.
June 21/22, 1920.—Special Peace Conference wire to Boulogne.
July 3/17, 1920.—Special Peace Conference wire to Spa.
Jan. 8, 1921.—Marconi Wireless Service, United Kingdom and France, established.
„ 21, 1921.—Through to Hanover (temporarily).
„ 26, 1921.—Direct communication Paris-Liverpool re-established.
„ 27, 1921.—Wireless service, London and Berlin *via* Stonehaven, opened.
Feb. 18, 1921.—Successful wireless trials, London and Cologne *via* Aldershot.
April 21, 1921.—Wireless messages from Berlin, received by Creed printer.

It was not until Jan. 10, 1920, that we were officially advised that the war had terminated.

The communications with France up to this time had left very much to be desired, and, owing to other causes over which the French Government had apparently no control, the working of the Paris wires was exceptionally bad. Visits had been exchanged between the two offices, a London deputation going to Paris and a Parisian delegation visiting London. Certain defects were noted, principally the miserably low and variable insulation of the French land-lines. *C'est-la guerre mon ami!* But matters did not improve, the traffic was still heavy and delays abnormally high. In the meantime there were special additional Peace Conference wires to provide for, to San Remo and to Boulogne with their attendant extra traffic elsewhere, and these circuits occupied some of the best of the Anglo-French lines, communication with Bale became a necessity, and the special newspaper wires to the Continent for the use of the British and American Press became a demand which could not be denied.

While making every allowance for the devastating results of the war in France some of us at least are still of the opinion that it would have been a real economy on the part of the French Government to have made a special effort to establish more reliable land-lines on their side of the Channel. The strength of a chain is its weakest link. However, in order to ease the situation the Marconi Wireless Service was established, as a temporary measure, between the United Kingdom and France on Jan. 8 last year. Meanwhile there were excellent submarine cables between this country and France, excellent land-lines from London to the coast only lacking the necessary electrical co-operation on the other side to give the finest International service going. Without fear of contradiction I would repeat, that, given the necessary conditions of a fair standard of maintenance on French territory, such as was intended by the International Convention, there are enough cable cores available to carry easily all the present traffic plus an additional 50 per cent., and that with a delay below the present average. That so good a service is possible one has only to prove by watching the London Stock Exchange wire working direct to Paris Bourse, with its average delay of something less than five minutes.

POST-WAR CALENDAR 3.

May 17, 1921.—London Stock Exchange and Paris Bourse direct 5-minute service opened.
„ 21, 1921.—Dresden wire opened.
„ 18, 1921.—Amsterdam wireless established *via* Caister.
„ 27, 1921.—Communication with Praha opened.
July 8, 1921.—Turin direct communication opened.
Sept. 5, 1921.—Amsterdam Stock Exchange wire re-opened (direct Bourse to Bourse working, Oct. 31).
Jan. 1, 1922.—Long-distance radio ships telegrams *via* Leafield.
„ 4, 1922.—Special Cannes wire (Supreme Council Conference).
Feb. 13, 1922.—Transmission of Italian traffic to S. Paulo, Rome, by wireless *via* Leafield.
„ 15, 1922.—Leafield-Cairo Wireless Service proved.
April 12, 1922.—Marconi Service opened, United Kingdom and Berne.
„ 24, 1922.—Opening of Oxford-Cairo Wireless Service to public.

(To be continued).

THE LATE SIR JOHN GAVEY, C.B.

ON Jan. 5 the remains of the late Sir John Gavey were laid to rest in the beautiful Teddington Cemetery situated between Bushey Park and the river Thames.

He retired from the Engineer-in-Chiefship in 1907, having held the office for five years. His reign at the G.P.O. is still well remembered, especially by those who came more immediately in contact with him.

His name is intimately associated in Post Office history with the valuation and transfer of the telephone trunk wires to the State in 1896, the introduction of the message rate of charge, the introduction of the multiple duct system for telephoning London, and the valuation and purchase of the National Telephone Company's plant and assets in 1912. In connexion with the last-mentioned work, he was appointed chairman of the Post Office Committee which determined the policy and the instructions to be given to counsel in connexion with the arbitration proceedings, and himself gave valuable evidence before the Railway and Canal Commissioners.

Permission by] [*Elliott & Fry, 65, Baker Street.*

THE LATE SIR JOHN GAVEY, C.B.

His outstanding ability both as an engineer and an administrator, his downright and straightforward honesty of character, were always in evidence. Ability, resource, and industry he was quick to discover and recognise, and in handling the large staff which he controlled fairness and justice were the basis of his actions. For these and other reasons he held the complete confidence and high regard of the whole of the engineering staff.

The late Sir John Gavey was a past President of the Institute of Electrical Engineers. Amongst the past Engineers-in-Chief of the Post Office this distinction was shared only by the late Sir William Preece. He was also a Director of the United River Plate Telephone Company.

Both at the church service at Hampton Wick and at the cemetery there was a fully representative attendance. In addition to Mr. De G. Gavey and Miss Gavey, son and daughter, Mr. Warner, son-in-law, Mr. de Gruchy, Mr. Ereaut and Mr. Schmidt, there were present Major Purves, Engineer-in-Chief; Mr. F. Gill, President of the Institute of Electrical Engineers, Sir John Snell and Mr. W. M. Mordey, past Presidents, and Mr. P. F. Rowell, Secretary of the Institute. Mr. J. E. Kingsbury and Mr. A. Anns, Directors, and Mr. A. J. Davis, Secretary of the United River Plate Telephone Company; Mr. G. F. Preston, Controller, London Telephone Service, Mr. F. Tremain and Mr. A. Moir, retired Superintending Engineers, Dr. Russell, Faraday House Institute, Mr. W. W. Cook, Consulting Engineer, Mr. Dane Sinclair of the Helsby Company, and others.

LONDON TELEPHONE SERVICE NOTES.

Retirement of Mr. L. A. Prossor.

THE retirement of Louis Anthony Prossor from the London Telephone Service on Jan. 5 of this year, marks an epoch in its history and is a milestone in the lives of many of his former colleagues who are now "20 years onward." It is but a few months more than that period of time since Mr. Prossor entered the Post Office London Telephone Service as its first Service Inspector, and in that capacity and subsequently as head of the Service Section, he had much to do with nursing it through the essential stages of early growth to that condition when it became a serious competitor of the National Telephone Company and a producer of an efficient means of speedy communication.

MR. L. A. PROSSOR.

Before joining the Post Office London Telephone Service Mr. Prossor had had experience of telephone work with the New York Company, and the knowledge so gained combined with a fine personality and the advantage of a University education made him a noticeable force. Moreover, at birth he had been endowed with a ready "Mother wit" and he knew in handling subscribers (many distinguished men) when to be suave and when to be indignant, when to yield ground and when to attack, and perhaps, greatest of all gifts in a "Telephone man," when silence is golden.

But this short appreciation to be complete must deal with the colleague as well as the official. Affectionately known as "Pa," he well merited the nick-name. Kindly and unselfish in his nature he had that sense of sympathy which enabled him to appreciate and understand the outlook of those who served with him. Undoubtedly the chief of this staff, he aimed at winning their goodwill rather than commanding their services. A man of marked intuition, he saw that time spent in furthering the social activities of the Telephone staff was time spent in furthering the well-being of the Telephone Service. Hence he took an whole-hearted interest in the relaxations of life. A staunch supporter of the Langham Choral Society and of the various Swimming Clubs associated with the London Telephone Service he did much to foster that spirit of good fellowship which means success. Perhaps, however, his greatest work was amongst the Boy Messengers. Boys ever appealed to him and he, the happy possessor of the "Spirit of Youth," appealed to boys. He interested himself in their education, their sports and their tastes for the Arts. May the music of the Orchestra he organised in the Boy Messengers' Institute be sweet and unceasing!

In taking his farewell, Mr. Prossor said "he was retiring but not going into retirement," and our hope is that the leisure he now enjoys may afford him opportunity for the full expression of his versatility. He will ever be a welcome guest amongst us.

It remains to be added that Mr. Prossor was given a very hearty and sincere farewell by his colleagues. First at an informal supper at which Mr. E. A. Pounds took the chair, and on the following day at a reception in the St. Bride Street Refreshment Club when the Controller, whose ready wit and ease of speech so well fit him for such occasions, presented Mr. Prossor with an antique Welsh dresser and a handsome solid silver salver as a token of his colleagues' esteem. Sandwiched in between these two functions was a little ceremony in the G.P.O. South when the Boy Messengers of the London Telephone Service gave Mr. Prossor an oak biscuit barrel, and on the evening of the same day Mr. Prossor listened to a further eulogy of himself at the Annual Prize Giving of the Boy Messengers' Institute. On this occasion, to the accompaniment of much vocal and instrumental efforts, he was "chaired" round the room. Truly a remarkable "Au Revoir," and one which we all hope will afford Mr. Prossor the joy which should be the lot of a valued friend.

* * * *

Post Office Sanatorium Society.

London Telephone Service Constituency.

At a Committee Meeting held on Dec. 15, some very interesting information was given by Miss Nurse (Trunk Exchange) who is a member of the Board of Management of the Society.

The Board have visited several Sanatoria this year—including Holy Cross Sanatorium, Haslemere, King Edward VII. Sanatorium, Midhurst, and Harefield Sanatorium. At the Holy Cross Sanatorium Miss Nurse had an opportunity of seeing two of our telephonists who were being treated there, and we were glad to know that they were happy and well looked after.

It is interesting also to learn that 5,500 new members have joined the Society since Jan. 1, 1921, of which over 400 were from the London Telephone Service. 96 applications for treatment have been received and dealt with since Jan. 1, 1922, and 43 cases still remain under treatment at 9 different Sanatoria, at which the cost varies from £2 2*s.* 0*d.* to £3 11*s.* 6*d.* per week.

It is hoped that any of our colleagues who do not yet belong to the Society will appreciate these facts and help the work by becoming members and adding their subscription (3*s.* per annum), as early as possible.

* * * *

London Telephonists' Society.

The annual dance of the London Telephonists' Society was held as usual on the last Saturday of the year, Dec. 30, at Bishopsgate Institute. Once more there was an overwhelming demand for tickets and many late applicants were disappointed. The full 250 turned up in spite of a very wet evening and the strains of Mr. Skinner's Orchestra soon obliterated all memories of damp journeys. As usual, everything went with a swing, Mr. Buckeridge, who has acted as M.C. at every dance of the Society within recollection, being once more in charge of the preceedings, and when he and Mr. Skinner collaborate, there is nothing for everybody else to do but enjoy themselves—which everybody duly did. The supper tables looked very inviting when the company sat down in gay parties for a brief period of rest and refreshment, but before long the programme was resumed with fresh zeal, one of the chief events of the second half being the "Telephone Quadrille," the *chef d'oeuvre* of the "Die Hards" of the Society. This year, owing to various causes, we missed a number of the familiar faces that have always been associated with the social events of the London Telephonists' Society, but shall hope to see them in full force next year. Those who were unable to come or were too late to obtain tickets will, perhaps, like to note that the Hall and Mr. Skinner have been booked for Saturday, Dec. 29, 1923!!

L.T.S. Successes at Typists' Hobbies Exhibition

The opening ceremony and distribution of prizes was performed by H.R.H. Princess Beatrice at the Fourth Civil Service Typists' Exhibition held at the Central Hall, Westminster, on Saturday, Dec. 9.

The chair was occupied by Sir Warren Fisher, Permanent Secretary to the Treasury, who, in his opening remarks said that the organisation produced a human interest, and in the Civil Service so much had to be performed which was inhuman, that anything which turned Civil Servants into ordinary human beings was for their good. There had been 1,500 entries in the competitions but their handiwork had not exhausted the good the Typists had done. They had collected over £100 for the great hospitals of London, and recently in one month another £30.

The competitions including painting, music (vocal, pianoforte and violin solos); elocution, essay, short story and poem; cookery, including cakes, apple pies, and assorted sweets; neddlework, knitted and crocheted articles in silk and wool; embroidery and doll dressing. Special mention is made of a hall mirror, the frame of which was made of beaten brass, with decorations of red enamel. Three brushes hung in the centre adorned with an initial letter. This was the work of Miss Henwood, a shorthand typist of the Controller's Office, London Telephone Service, and the whole article was beaten out and put together by hand. The judges were so impressed by its originality that a special prize was awarded. Miss Henwood also carried off the second prize for apple pie. The second prize for coloured embroidery was secured by Miss A. D. Taylor, and Miss Rumsey (both of whom are shorthand typists in the Controller's Office) was highly commended for a crocheted jumper in wool.

Culled from the Exchanges.

Central Exchange.

The appeal put forward to the staff at Central Exchange on behalf of the provision of Christmas toys to the children of Shadwell Hospital met with very gratifying results.

As a consequence a considerable number of dolls (which were dressed by the Supervisors and Telephonists of that exchange) and other toys were sent to the Hospital, where there is no doubt they were greatly appreciated.

Gerrard Exchange.

On Dec. 15, Gerrard Swimming Club held a Christmas party, and everybody thoroughly enjoyed themselves. Great fun was caused by Father Christmas who distributed the present from the Christmas tree, assisted by P.C.999 who kept order.

Dancing and games occupied most of the evening, and altogether the party was a huge success.

On Jan. 5 a dance was held at Finsbury Town Hall which, despite the weather, proved a great success.

Digitized by Google

Mayfair.

On Wednesday, Nov. 29, the staff at Mayfair held a very enjoyable dance at the Q.V.R. Drill Hall, Davies Street, W.1, in aid of the Hospital Saturday Fund.

Over 250 guests were present, and Mr. Howe, Inspector from the Engineering staff, was a very able M.C.

During the evening, Miss Reekie, the Hon. Secretary of the Staff Hospital Collections, announced that the proceeds of the dance would amount to £20, and she thanked those present for their kindly support.

A whist drive was held by the Mayfair staff on Dec. 4 at the Cabin Restaurant, Strand. Although the numbers were smaller than anticipated, a very pleasant evening was spent. Mr. Howe again kindly acted as M.C., and Miss Reekie presented the prizes.

In connexion with Miss Reekie's special appeal on behalf of the Hospital Saturday Fund collections, the staff at Mayfair held a small bazaar and sale of work on Friday, Dec. 15. The proceeds amounted to £21 and all those who took part are to be congratulated on a very enjoyable and successful evening. The bran tub and guessing competitions caused much amusement and added to the merriment.

Putney.

A tea was given by the staff of the Putney Exchange to 100 very poor children at St. Mary's Mission Hall, Garratt Lane, Wandsworth, on Saturday, Jan. 6. The staff, assisted by a "Charlie Chaplin" from the Engineering side, entertained the children after they had been regaled with sandwiches, "wedding" cake (so called by one of the tiny guests) and other dainties. The entertainment, which included a Japanese costume song, another with a chorus of realistic sweeps, and a show of waxworks conducted by the renowned Mrs. Jarley went well, but the culminating point was reached when—the lights lowered—the curtain went up revealing a large Christmas tree, lighted by tiny coloured electric lights (the work of the Engineers) and loaded with presents. Santa Claus assisted by a wonderful fairy "straight from Fairyland," distributed these presents to the little ones, whose eyes were wide with wonder and delight. Each girl had a doll and the boys had suitable toys, sweets, oranges, apples, and nuts were added, and 7.30 p.m. found the little ones "tired but 'appy" going home laden to their waiting mothers.

Trunks.

Members of the Trunk Exchange staff have this season formed a Net-ball Club to be known as the Stanbury. The first match was played on Saturday, Dec. 9, against a team from Clerkenwell, with a victory for the Stanbury who scored 20. Clerkenwell 11.

Matches with teams from other London exchanges are invited. Communications should be addressed to the Hon. Sec., Miss B. E. Finch, 22, Canonbury Street, N.1.

Victoria.

During the year 1922, the staff at the above exchange collected £62 13*s.* 3*d.* Of this total, £55 was sent to Westminster Hospital, and £7 13*s.* 3*d.* to other deserving charities. This collection is, of course, quite separate from the Saturday Hospital Fund.

REVIEWS.

"*Catalogue of Scientific and Technical Books.*" *Sir Isaac Pitman & Sons, Ltd.*—This is a very useful compilation, containing a list of works on all kinds of scientific and especially engineering subjects. There is a special section on telegraphy and telephony, comprising several books by Post Office authors.

"*The Journal of Public Administration.*" *Sir Isaac Pitman & Sons, Ltd. Quarterly* 2*s.* 6*d.*—We have received the first number of this journal which is designed to serve as a record of the work of the Institute of Public Administration. It extends to 80 pages and contains several authoritative articles by distinguished Civil servants. Viscount Haldane's inaugural address entitled "An Organised Civil Service," which we are glad to see reprinted here, deals with the ideals demanded of that service, and as might be expected insists on the importance of a high standard of education and largeness of outlook. Mr. Stuart Bunning contributes an interesting article on the American Civil Service, Sir W. Clark one on Government and the Promotion of Trade, and Mr. Corner another on the aims of the Institute. Mr. Lee in a characteristic article on "Security," deals with this subject from a fresh angle. In short, the journal is full of matter interesting to the Civil Servant and should form an invaluable medium for the exchange of opinion to all those interested in administration in all parts of the Empire. We wish it every success and concur in the editorial suggestion that even privately-owned industry may have something to learn from its pages.

PROGRESS OF THE TELEPHONE AND TELEGRAPH SYSTEMS.

TELEPHONES.

AN exceptionally large number of new stations were added to the Post Office system in November, the net increase for the month being 8,709. The total number of stations in use on Nov. 30 was 1,020,300, of which 365,533 were connected with London exchanges, and 654,767 with Provincial exchanges.

The number of call office stations working at the end of November was 16,093, the net addition during the month, viz., 131, exceeding that for October, the previous best on record, by 7. Public call offices in street kiosks numbered 356, an increase of 12 during the month.

The net increase in the number of rural party lines was 357, bringing the total up to 5,936 at the end of the month, as compared with 2,794 at the end of November, 1921.

Since the announcement of the revised conditions under which exchanges in rural areas may be authorised, support has been obtained for 255 new exchanges. At the end of December 27 of these exchanges had been opened and advice notes to open a further 146 exchanges had been issued. In the remaining cases the completion of preliminary arrangements, such as the question of housing the exchange or the necessity for a guarantee, had prevented the issue of the advice notes.

The weekly returns of traffic show that the average calling rate per line during November was the highest for any month since the introduction of the new tariff. Compared with the corresponding month of the previous year the increase in the calling rate, however, was only about 3 per cent.

The improvement in the trunk traffic referred to in the previous issue was maintained during October, the number of calls originated during the month being in fact the third highest on record. Compared with October 1921, the increase in traffic amounted to 14 per cent.

Further progress has been made with development of the local exchange system. Among the more important new exchanges opened are the following :—

London.—Chislehurst.

Provinces.—Edinburgh (Museum), Tonbridge and Ebbw Vale.

The following important exchanges have been extended :—

London.—Park and Epsom.

Provinces.—Birmingham (Victoria), Redditch, Torquay, Brighton (Kemptown), Glasgow (Western), and Dundee.

The main underground system has been extended by completion and bringing into use of new cables as follows :—

Manchester—Ashton—Mossley.
London—Brighton.
Brighton—Worthing.
London—Leatherhead—Dorking—Cobham.
Hertford—Ware.

During the month of December 21 new overhead trunk circuits were completed and brought into use, and 41 additional circuits were provided by means of spare wires in underground cables.

TELEGRAPHS.

During the month of January the following circuits have been equipped for Baudot working :—

Bristol—Plymouth, four duplex arms.
Birmingham—Edinburgh, four duplex arms.
Birmingham—Cardiff, two duplex arms.

The last-named circuit will shortly be extended to Milford Haven, the resulting facilities providing two duplex arms between each of the three stations.

THE ECONOMIC POSITION OF WOMEN.*

BY MISS NORA MILNES, B.Sc.

Director of the School of Social Study, Edinburgh University.

MISS MILNES said when she began to speak about women she was reminded of a play which many of the audience had seen or probably read. She referred to Maeterlinck's "Blue Bird." There, the little boys and girls in the other world before this world were anxious to come into it; always fighting to come into it. It was very charming to see it. She was sure that many would like to get into another world, and to say to one or two of those people that there are certain things to think about before they came. In the other world they ought to be careful of certain things: such as whom they chose for their parents; if they were going to be girls, think about it twice before they come at all.

Someone had said that it was not possible to talk about the economic position of women because it did not exist. She was not quite sure about that. She tried to remember that she was one of those babes anxious to come into this world and, having got here, tried to make the best of it, and to see that so far as her passage allowed, she left the world a little better than it was when she came into it.

Miss Milnes considered that the position of women to-day was very greatly influenced by various factors that arose during the War and even more a result of factors that existed before the War. The obligations with which they were faced to-day were due to the enormous increase that took place during the War among the number of women workers—about 1¼ million. The increase was very large in the Civil Service. She therefore found herself faced with an enormous number of women workers anxious for employment. It was very interesting from the point of view of women that they entered into fields of employment which were formerly regarded as an absolute prerogative of their friends or enemies—she was not quite sure which; any way, the men. It was found, however, that the women performed the work sufficiently well and, in some cases, it must be mentioned, even better than the men. She would like to add that in many cases they did not perform the work better than the men, and the general conclusion arrived at by the War Cabinet Committee on women's work was that it took three women to equal two men's work.

The lecturer considered that if women wanted to move forward they must examine themselves and see what their defects were. But apart from defects they certainly laboured under certain disadvantages in the fields of work, and organisers of business would say the same thing. When women and men were put working side by side certain definite provision had to be made for the women staff, and, unless that was going to be a fairly large staff, it did not pay to make that provision. A result in many occupations after the war was that when many women had to go out of employment the rest of the women also went.

Then again, the lecturersaid,the average woman was not equal to the average man, and she said this because she believed it was remediable. She did not believe it remediable by saying, "We are equal." She believed that things could only be remedied by asking what was the matter with them, and having found that out to try and put it right. The first disadvantage was a physical one. There were exceptions, but taking women as a whole, it was proved that they suffered strain more severely than men. Although they did most wonderful work in spurts, this work took toll of them. She thought that was admitted, in that the very women who fought for equality made it a point that night work for women should be forbidden. Unfortunately, the physical test was always coming out, and it was the physical test that told very largely in this world. She would like to say in passing that the old-fashioned headmistress who condemned sports ought to be dismissed from her post on the spot; their one chance of becoming physically better was thus being killed.

There was one important defect in women and that was they were not so well fed as men. The average girl worker really did not feed herself properly, although she had improved tremendously in this respect.

The old question turned upon the miserable question of equality. She laid it down dogmatically that things which are different cannot be equal. A man and a woman were different. It was said that if women did the same work they should receive exactly the same pay. She agreed, but it had not been proved that she was doing the same work. When a woman married she left her work. If a man was getting married he was offered an increase in salary, but she had never heard of a woman deciding that she would not get married because she was offered an increase of salary. That was a fundamental difference. When you are training people, it is going to pay you to train the people who stay with you. In consequence of that every employer was not thinking much of the present value of the individual, but was thinking of the future value as well, and that he did not know in the case of a woman. She might have just completed her training when she left to get married. The employer feels that all this training is thrown away. This had a very serious effect on the mind of men because looking

* Paper read to the Edinburgh Telegraph and Telephone Society on Dec. 5, 1922.

Digitized by Google

at the thing from a long time point of view and until you had solved the question of who was going to marry, a woman could not be regarded in the same way as a man. This worked as regards women's training. Many parents did not think it paid to train their daughters, and the woman found herself entering the labour market not so well equipped as a man.

Miss Milnes wished to insist that women had got to see to it that they started on their professional lives as well equipped as possible. It was going to be their only chance. She thought that women ought even to be better equipped than men because with the physical disadvantage and the marriage disadvantage they had obstacles to overcome.

TELEPHONIC DEVELOPMENT OF THE WORLD AT DECEMBER 31, 1921.

BY W. H. GUNSTON.

(*Continued from page* 74.)

TABLE II.

ASIA.

Japan (342,931 in 1920) est.	370,000
Chosen (13,700)	15,000
Manchuria (10,681)	13,000
Sakhalin (1,327)	1,400
Formosa (8,700)	9,600
China (1920)	35,910
Hong Kong	6,787
India	37,067
Ceylon	4,158
Straits Settlements (State)	1,264
Singapore (Oriental Telephone Co.)	3,739
Federated Malay States	2,898
Dutch East Indies	35,890
Phillipines (1920)	12,451
Siberia, Russian Turkestan, etc. (1915) ...	18,600
Azarbaijan (1915)	6,500
Georgia (1915)	2,700
Iraq	1,102
Palestine	1,129
French Indo-China	1,759
North Borneo	315
Total with allowance for Syria, Persia, and Siam	585,000

Population 910,000,000, or 1,569 inhabitants per telephone.

The figures for India, Malay, etc., the Dutch Indies, Hong Kong and Western Asia are official. The figures for Siberia, Transcaucasia, etc., relate to 1915 when those countries were part of the Russian Empire. It is probable that their number of telephones has decreased, but as a set-off no increase has been estimated for China in 1921. The telephone is making some progress in Mohamedan Asia, and official informaton has been furnished from Iraq and Palestine. A telephone company is known to exist in Persia. The figures for Japan and its possessions have been estimated on the basis of the normal annual increase in those states.

India.—On March 31 13,316 telephones were connected with the Government system and 23,958 with that of the Oriental and associated companies, of which 8,272 were in Calcutta, 2,102 in Madras and 9,885 in Bombay, Karachi, and Ahmedabad.

Dutch Indies.—Of the total of 35,890 telephones 8,227 were in Batavia and 5,799 in Soerabaia.

Azarbaijan and Georgia.—In 1915 there were 6,137 telephones in Baku, 179 in Elisavetpol, 155 in Erivan, 2,060 in Tiflis, 332 in Batoum and 185 in Kutais. The present state of development is not known.

TABLE III.

AFRICA.

South Africa (51,439 in 1920)	52,999
Egypt (22,665)	24,719
Algeria	15,400
Tunis (4,400) est.	4,800
S. Rhodesia	1,563
Mauritius	1,104
Madagascar (est.)	612
Mozambique (est.)	370
Senegal and Dahomey (French) est. ...	300
Gold Coast (est.)	258
Belgian Congo (est.)	175
	102,000

Population 180,000,000 or 1,765 inhabitants per telephone.

Egypt.—Cairo has now 9,817 telephones and Alexandria 7,134.

Algeria.—There were 4,863 telephones in Algiers and 1,833 in Oran.

South Africa.—The development of the principal towns is as follows: Johannesburg 13,863, Cape Town 9,334, Pretoria, 3,455.

TABLE IV.

NORTH AMERICA.

	1921.	1920.	Population (Thousands.)	
United States	13,875,219	13,411,379	107,000	7.7
Canada	902,090	856,266	8,700	9.6
Mexico (est.)	47,000	44,748	16,000	340
Cuba	38,000	34 376	2,900	77.2
Hayti and Dominican Republic	2,000	1,938	3,400	—
Central America	18,000	15,950	6,000	—
Total	14,882,000	14,365	145,000	9.7

United States.—The total is made up as follows:—

American Telephone & Telegraph Co. (Bell system)	8,914,155
Companies in connexion with the Bell system ...	4,466,064
Independent Companies...	495,000
	13,875,219

The first two items are official, and the third has been obtained from a reliable estimate.

Canada.—The number of telephones in the principal provinces is as follows:

Ontario	380,211
Quebec	146,856
Saskatchewan	96,239
British Columbia	79,069
Manitoba	68,463
Alberta	64,383
Nova Scotia	35,418
New Brunswick	26,322

The figures relating to *Mexico, Central America* and the *West Indies* for 1920 have been kindly furnished by Mr. Berthold, of the American Telephone and Telegraph Co. and have been increased in accordance with nominal development. The same remarks apply to the statistics for South America.

TABLE V.

SOUTH AMERICA.

	1921	1920	Population (Thousands).	Population per telephone.
Argentine	121,000	116,553	8,250	68
Bolivia	2,517	2,517		
Brazil	93,000	85,091	30,650	230
Chile	33,000	29,867	4,200	127
Colombia	7,700	6,843		
Ecuador	4,700	3,946		
Guiana	1,898	1,898		
Paraguay	400	406		
Peru	9,200	8,552		
Venezuela	9,500	8,896		
Uruguay	24,000	22,381	1,400	60
	307,000	286.950	60,000	196

TABLE VI.

AUSTRALASIA.

	Telephones.	Population.	Population per telephone.
Australia (233,406 in 1920) ...	251,029	5,500	21
New Zealand (88,541)	94,849	1,200	12.6
Hawaii (1920)	14,376	255	16
Fiji	742	157	—
Totals (with allowance for other places)	361,500	7,500	21

Australia.—The telephonic development by States is as follows, New South Wales 101,617, Victoria 74,927, Queensland 30,845. South Australia 22,505, Western Australia 13,591, and Tasmania 7,544.

Digitized by Google

Sydney had 62,301 stations, Melbourne 50,777, Adelaide 17,022 and Brisbane 13,202.

New Zealand.—Wellington possessed 11,684 telephones, Auckland 10,757 and Christchurch 8,327.

TABLE VII.

LIST OF CITIES WITH UPWARDS OF 20,000 TELEPHONES.

New York	979,534	*Cologne*	38,666
Chicago	605,495	New Orleans	38,316
Berlin (Greater)	347,735	*Liverpool*	38,219
London (Telephone area)	345,797	*Frankfurt on Main*	37,705
Boston	313,295	Atlanta, Georgia	36,541
Philadelphia*	233,122	*Dresden*	36,286
Paris	173,300	Des Moines	34,791
San Francisco	162,430	Winnipeg (1920)	33,682
Los Angeles	162,118	Osaka (1920)	33,004
Detroit	154,077	Houston (Texas)	32,954
Cleveland	153,951	*Amsterdam*	32,756
*Pittsburg**	129,436	Spokane	30,831
Stockholm	110,095	New Haven (Conn.)	30,871
St. Louis*	108,136	Rio de Janeiro	30,523
Copenhagen (and suburbs)	106,105	*Kristiania*	30,285
Cincinnati	102,166	Hartford (Conn.)	29,776
Toronto	101,452	Worcester (Mass.)	29,276
Vienna (98,000)	100,000	Springfield (Mass.)	29,213
Minneapolis	96,166	Syracuse (N.Y.)	28,575
Washington	96,111	Richmond (Virginia)	28,495
Hamburg	95,534	*Breslau*	27,736
Baltimore	92,259	Salt Lake City	27,550
Milwaukee	88,746	Dayton, Ohio	27,117
Montreal	83,917	*Birmingham*	26,391
Seattle	76,907	*Düsseldorf*	26,288
Indianapolis	75,325	*Stuttgart*	26,211
Buffalo	72,949	Youngstown, Ohio	25,830
Buenos Aires (1920)	65,383	Memphis	25,687
Oakland (Cal.)	67,729	Akron	25,226
Portland (Oregon)	65,173	*Rotterdam* (1920)	24,848
Tokio (1920)	64,564	Ottawa	24,996
Sydney	62,301	Habana (Cuba) 1920	24,936
Petrograd (62,000 in 1916)	—	San Antonio (Texas)	24,377
Denver (Col.)	58,751	Rochester, N. Y. (1920)*	23,940
Moscow (57,000 in 1916)	—	*Brussels*	23,809
Kansas City (est.)	57,000	*Nürnberg*	23,671
Omaha	56,651	Norfolk (Va.)	23,363
Columbus Ohio	56,423	Mexico City (1920)	23,503
Newark, N.J.	54,015	*The Hague*	23,179
Melbourne	50,777	*Hanover*	23,102
Providence	49,548	*Gothenburg*	22,804
Manchester	47,301	Oklahoma City	22,834
Toledo (Ohio)	46,692	*Warsaw* (1919)	22,400
Munich	46,214	Fort Worth	22,247
Buda Pest	44,398	*Zurich*	20,983
Glasgow	42,514	East Orange, N.J.	20,702
Jersey City	42,506	Birmingham (Alabama)	20,231
Leipzig	41,906	Tacoma	20,194
Vancouver	40,494	Scranton (Pa.)*	19,680
Dallas (Texas)	40,108	Louisville (Kentucky)*	18,787

55 of these cities are in the United States, 9 in the rest of America, 32 in Europe 2 in Asia and 2 Australasia.

* These figures relate to the number of Bell Stations only. Towns so marked have at least 10 per cent. additional stations belonging to independent Companies.

TABLE VIII.

CITIES WITH OVER 10,000 TELEPHONES.

United States (55 of these are enumerated in list VII)	106
Germany (enumerated in the notes on Europe)	23
Great Britain and Ireland (enumerated in the notes on Europe)	13
(In addition Nottingham and Belfast contain over 10,000 stations within the limits of the old telephone area.)	
Canada (Montreal, Quebec, Toronto, Vancouver, Winnipeg, Ottawa, Hamilton, London, Edmonton, Halifax, Victoria, B.C.)	11
Japan (Tokyo, Osaka, Kioto, Nagoya, Kobe)	5
Australia (Sydney, Melbourne, Adelaide, Brisbane)	4
Switzerland (Zurich, Geneva, Basle, Berne)	4
France (Paris, Lyons, Marseilles)	3
Holland (Amsterdam, Rotterdam, The Hague)	3
Sweden (Stockholm, Gothenburg, Malmö)	3
Italy (Rome, Milan)	2
Belgium (Brussels, Antwerp)	2
Russia (Petrograd, Moscow)	2
Spain (Madrid, Barcelona)	2
New Zealand (Wellington, Auckland)	2

One Each.

Denmark (Copenhagen), Norway (Christiania) Austria (Vienna), Poland (Warsaw), Czecho-Slovakia (Prague), Hungary (Buda Pesth) Danzig (Free City), Portugal (Lisbon), China (Pekin), South Africa (Johannesburg), Cuba (Havana), Mexico (Mexico), Brazil (Rio de Janeiro), Argentine (Buenos Aires), Uruguay (Monte Video)	15
	200

Of these 118 are in North America, 65 in Europe, 6 in Asia, 1 in Africa, 3 in South America and 6 in Australasia.

It may be of interest to put on record the number of telephones in the British Empire at the end of 1921:

Great Britain	997,805
India	39,450
Ceylon	4,158
Rest of Asia	15,000
South Africa	52,999
Rest of Africa	3,000
Canada	902,090
Australia	251,029
New Zealand	94,849
Total, upwards of	2,360,000

BAUDOT DUPLEX RESULTS.

BY A. C. BOOTH.

Now that the use of the Baudot Duplex, which is quite distinct from the Baudot Simplex system as developed in France, has been fitted to most of the main telegraph lines in Great Britain, it may be worth while to bring to general notice a few results which were obtained in the early days of its struggle for existence, when the conservatism of some of the older officials was sufficiently strong to delay, but not to stop, its development for a number of years.

The results obtained in those days were so good that they were considered to have been too good to be true. Indeed, it was actually stated that such results must have been "engineered."

The following results are extracted from *I.P.O.E.E. Journal*, and may be a useful guide to officers now in charge of Baudot Duplex sets as showing what the system is capable of doing when necessary.

Extracted from the "I.P.O.E.E. Journal," Vol. 6, page 324, 1913:—

"Duplex working of the Baudot system continues to yield the excellent results that were obtained from the sets installed at the Central Telegraph Office in 1910.

"The Quadruple Duplex on the underground loop circuit between London and Birmingham gives a uniform daily output of some 3,600 messages in 12 hours, including the slack hours of the early morning and late evening. Occasionally the daily total has exceeded 4,000, whilst on the day following the fire at the test-box of the C.T.O. in August, 1912, the following results were obtained between 10 a.m. and 5 p.m.:—

10—11 a.m.	= 595	Total of 3,851 messages in 7 hours.
11—12 „	= 576	„ 5,025 „ 12 „
12— 1 p.m.	= 551	Average of 550 messages per hour.
1— 2 „	= 579	„ 68.75 „ channel.
2— 3 „	= 516	
3— 4 „	= 501	
4— 5 „	= 533	

Extracted from the "I.P.O.E.E. Journal," Vol. 8, page 13, 1915.

"In order to ascertain the maximum amount of traffic that can be carried by the different types of Duplex Baudot, the Controller of the Central Telegraph Office, London, was good enough to arrange for two-day tests of the sextuplo duplex to Birmingham, the quadruple duplex to Liverpool, and the recently erected quadruple duplex to Glasgow, which works through a duplex repeater at Warrington.

"The idea of the tests was to ascertain the approximate value of such apparatus under emergency conditions, such as occurred at the C.T.O. in 1910. There was no intention to ascertain operator output, because that had been already tested over a considerable period. In 1910 the quadruple duplex to Birmingham carried as many as 600 messages in one hour; the quadruple duplex to Liverpool carried as many as 628 in one hour, thus confirming the figures obtained in 1910. The results on the Glasgow quadruple duplex were not so good, being only 446; but this set has been installed quite recently, and, owing to the war conditions, the messages are noticed to be considerably longer than those at Birmingham and Liverpool.

Digitized by Google

"The sextuple duplex carried 849 messages in the hour, and was not even then at its best, as Birmingham sent 455 to London's 394. This difference was due to slight faults in the printing apparatus at Birmingham, and to a slight insufficiency of traffic. Under better conditions it is expected that the figure of 900 messages in the hour would have been exceeded.

"The results obtained are most creditable to all concerned, and show the value, not only of the Baudot as such, but also of the duplex method of working, which was so severely criticised before it had been tried, although it has since been adopted in the Murray multiplex. The Western Electric Company have also adopted the duplex method in their multiplex apparatus, which is now being tested in this country.

"For record purposes and for the benefit of those readers desirous of obtaining further details of the tests, the results are set out in the following tabular form :—

LONDON-LIVERPOOL. QUADRUPLE DUPLEX BAUDOT.

Noon to 1 p.m.	71 72	65 55	66 14	67 63	65 48	69 50	404 302	706

"Excellent as the results are, there are two other important features in favour of the system viz., a very appreciable decrease in the delay on the work passing over this system as compared with other types, the rapid correction of errors, and the fact that the skilled sending is very easily learned and is preferred to Morse or typewriter working. Correct sending at 30 words per minute has been learned in a week; the outside time required is less than two months

"The foregoing tests were made at a working speed of 30 words per minute per channel, which is the generally accepted rate of working. With the introduction of alphabetical keyboard perforators and automatic transmitters, the speed can be readily raised to 40, 45 or even 50 words per minute. Even with the ordinary 5-key Baudot keyboard a speed of 45 words per minute has been maintained without any error for some minutes. We may, therefore, yet be able to see the skilled telegraphist holding his own with the very much more costly keyboard perforator and automatic transmitter.

"As an instance of the reliability of Baudot Duplex working on long lines, the following consecutive daily results obtained on the recently installed London to Glasgow circuit of some 400 miles in length, with a duplex repeater at Warrington are worth recording :—

LONDON TO GLASGOW.

1915.	Sent.	Received.	Total.
Feb. 1	1,784	1,217	3,001
„ 2 ...	1,885	1,539	3,424
„ 3	1,950	1,564	3,514
„ 4	1,645	1,310	2,955
„ 5	1,845	1,409	3,254
„ 6	1,491	1,137	2,628
„ 8	1,690	1,380	3,070
„ 9	1,773	1,362	3,135
„ 10	1,846	1,407	3,253
„ 11	1,895	1,503	3,398
„ 12	1,905	1,514	3,419
„ 13	1,562	1,258	2,820

"The figures are not so good as those on similar quadruple duplex Baudot sets on the shorter circuits to Birmingham and Liverpool. This is not due to the greater length of the circuit but to the facts already mentioned, longer messages and less experienced staff. There is, however, not much room for an increase in the general reliability and uniformly good working, but there is no question that the amount of work dealt with will increase with longer experience.

"It will be interesting to compare these results with similar tests on other systems of large output. At present I think the 849 on the sextuple duplex is easily a world's record, because the messages were finished and disposed of, whereas in a Wheatstone system, where a far greater number of messages can be transmitted, they are very far from being finished with, and generally a second circuit is required for clearing up the corrections, &c."

PRESENTATION TO MR. ARCHER SMITH.

ON his departure to take up the District Managership of Manchester, Mr. Archer Smith, District Manager, Newcastle, was presented with a solid silver rose bowl, a beautiful example of the silversmiths' art, in token of the esteem in which he is held by the Newcastle district staff. In the presence of a large and representative gathering, Mr. Robson, chief clerk, made the presentation, and paid warm tribute to the many qualities which had rendered Mr. Smith so popular with the staff. The contract manager, Mr. J. P. Urwin, and the traffic superintendent, Mr. J. Gwyther, also spoke highly of Mr. Smith, both as a superior officer and friend.

Mr. Smith, in replying, referred feelingly to the happy time he had spent among the North Country folk, and expressed his regret at parting from so many friends, whose good wishes go with him to his new sphere of work.

PRESENTATION TO MR. J. D. W. STEWART.

MR. J. D. W. STEWART, District Manager, was presented with a demi-hunter gold watch and an "Eversharp" pencil by the Manchester telephone Staff on Jan. 15, prior to his departure to Newcastle. A small token of esteem in the shape of a gold pendant set with pearls and amethysts was also presented to Mrs. Stewart. The presentation was made by Mr. Elliott, Contract Manager, who, in a happy speech, conveyed to Mr. Stewart the feelings of the Staff in losing him after nearly 11 years' service in Manchester. Mr. Godfrey (Chief Clerk), Mr. Staite (Traffic Supt.), Misses Dutton and Lees (Fees Division) and Mr. Humphreys (Clerical Staff), also spoke as to Mr. Stewart's thorough and conscientious manner in dealing with business or staff matters. Mr. Stewart responded in suitable terms.

HOW THE TELEPHONE WORKS.

BY A. CROTCH.

VI.

FIG. 17 illustrates the switch, complete with its electro-magnet and bank of contacts. Associated with it is the line and cut-off relay shown in Fig. 18. The upper bobbin of this combination belongs to the cut-off relay and its armature is at the left hand side and cannot therefore be seen. The line relay is the lower

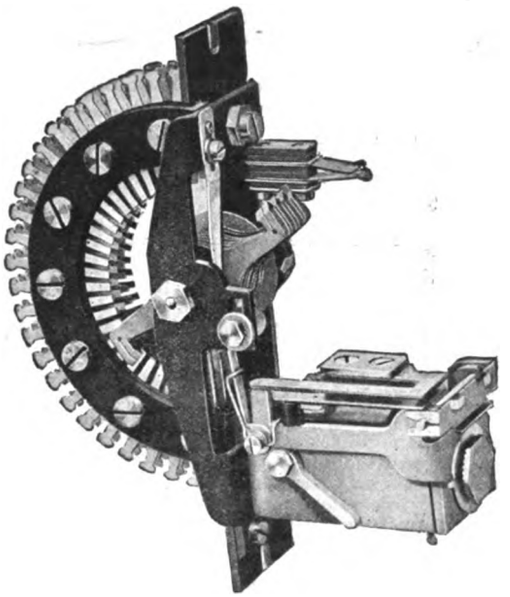

FIG. 17.

one and its armature is on the right hand side, hinged on the common base. At its free end it carries an extension which, when actuated, will cause the two outer springs on that side to make contact with two others. Pivoted on the back plate is an arm which normally lies horizontally (as shown). In this position it prevents the cut-off relay armature from making its full journey; the latter then moves the four left hand springs sufficiently to break their contacts, but not sufficiently to make contact with others. When the line relay is actuated, its armature causes the left hand end of this arm to rise clear of the cut-off armature. Hence when the two are energised, all the springs move sufficiently to break existing and to make new contacts. Fig. 19 gives the connexions of the switch.

Selector.—The principle is shown in Figs. 15 and 16. The actual instrument is given in Fig. 20 and a connector in Fig. 22: the working parts, however, are practically the same in both. The

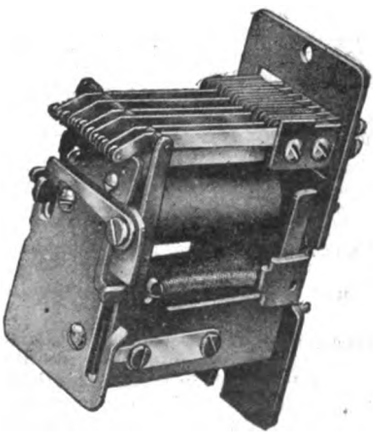

FIG. 18.

principal difference is in the number of relays fitted, five in the selector and nine in the connector (one missing in figure). The two figures are on different scales. It will be remembered that the office of the selector is to be stepped up to the hundreds level by the impulses of the first digit and then to automatically rotate until a connector is found.

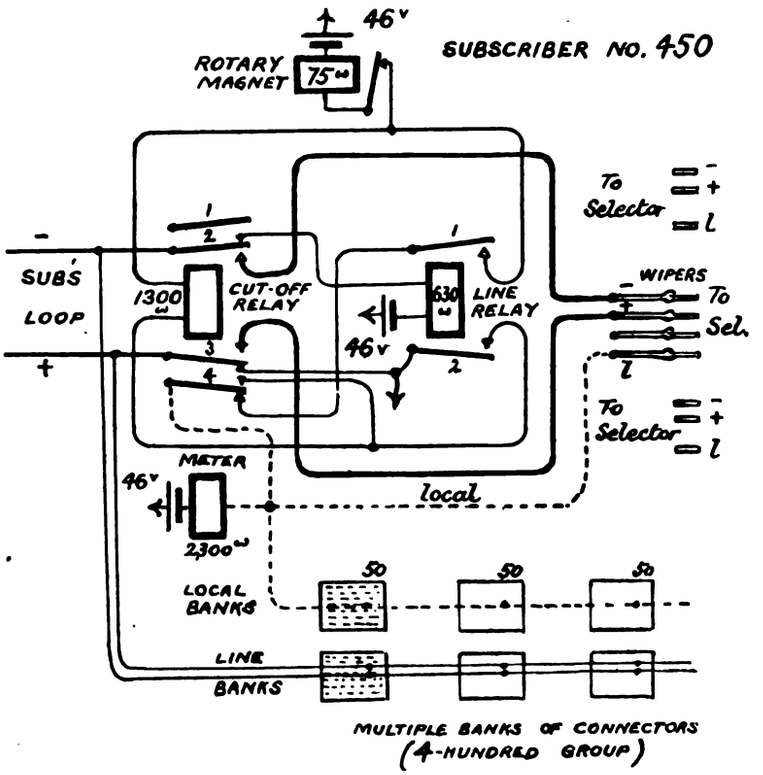

FIG. 19.—CONNEXIONS OF LINE SWITCH.

The diagram of connexions is given in Fig. 21. On the metal back, above the moving parts, are mounted the five relays SA, SB, SC, SD, and SE (the S being prefixed to the letters to indicate that they belong to the selector.) SA is the "impulsing" relay. SB has a solid copper block or "slug" at the base of the core which

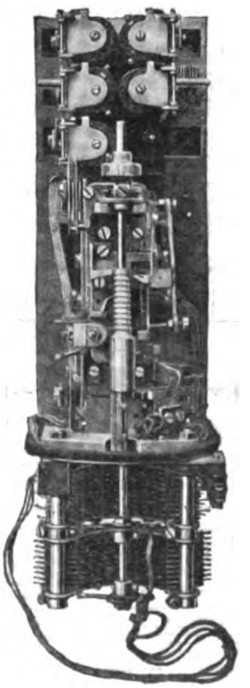

FIG. 20.

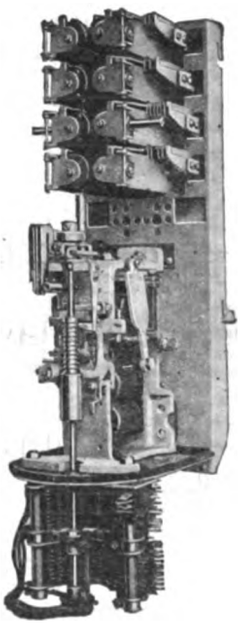

FIG. 22.

Digitized by Google

has the effect of delaying the release of the armature on the cessation of the current. That is, if a series of impulses pass through the coils, the armature will remain attracted throughout the series.

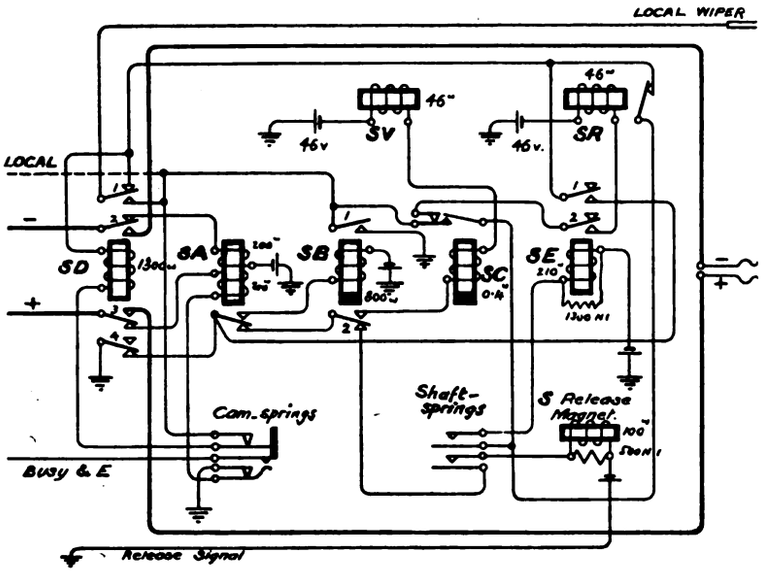

FIG. 21.—CONNEXIONS OF SELECTOR.

SC is similarly provided and is in series with the vertical magnet. SD is the "back bridge relay"—until this operates, the selector wipers are disconnected; so that, in seeking a connector, they shall cause no disturbance in passing over the contacts of those engaged. The function of relay SE is to provide a circuit for the automatic energising of the rotary magnet until it finds a disengaged connector.

On the lower part of the spindle a cam is fixed. When the shaft has rotated the wipers over the whole ten contacts without finding a disengaged connector, it moves another step into an extra (11th) position. No contacts are fitted here but on reaching this position the cam actuates a set of springs which give the "busy" tone to the calling subscriber. At the upper end of the shaft are two pairs of springs (the shaft-springs or the "off normals") which, when the selector is at rest (disengaged) are disconnected from each other. The first current received raises the shaft one step and this allows two springs to make contact with the other two.

Connector.—This is shown in Fig. 22 and its diagram in Fig. 23. It differs from the selector as follows: No cam or cam-springs are fitted; the springs at the top of the shaft, the shaft-springs or "off normals," are five in number and normally "make one." At the first upward movement of the shaft this connexion is broken and two others are "made": four extra relays are fitted, or nine in all.

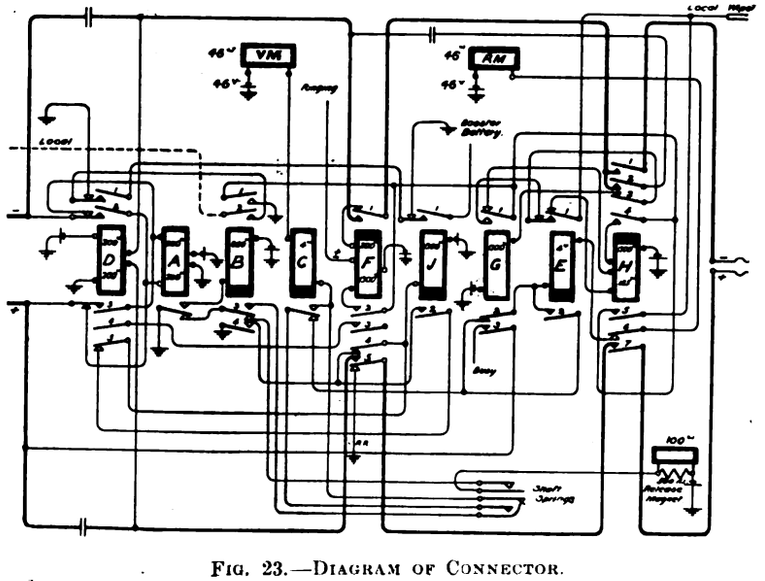

FIG. 23.—DIAGRAM OF CONNECTOR.

A is the impulsing relay: B, C and E are coppered and have similar functions to those on the selector: D's contacts, when actuated, reverse the connexions of the A relay coils (and therefore the battery) to the calling loop: F applies the generator to the wanted subscriber's loop; H throws the lines on to the wipers; G furnishes the "busy" tone to the calling subscriber when the desired number is engaged and J brings in an additional battery for metering purposes. F and H are coppered at the armature end of the core, which delays both their magnetisation and demagnetisation.

Having described the various pieces of apparatus concerned, we will now consider the operations involved in one subscriber getting through to another.

(To be continued).

TELEGRAPHIC MEMORABILIA.

MURRAY Multiplex is now in daily use on one of the special wires working into the *Manchester Evening News*' office in cottonopolis. Our congratulations to D. M. not only for having kept abreast of our American friends in the pleasant rivalry of the multiplex system, but also on account of the excellent "press" which followed the innovation. "MODERN MAGIC AND THE DAILY PRESS. QUICKEST KNOWN METHOD OF TELEGRAPHING NEWS" make splendid headings for cross columns, followed later by "WONDERWORKING MACHINE. HOW FOUR DIFFERENT MESSAGES ALL COME AT ONCE OVER ONE WIRE." Our Manchester press friends have, however, rather overdone it when they quote Hughes and Baudot as "the two great names in telegraphic history," as though there were no others. In all kindliness it might be said that a little closer study of the evolution of telegraphy is suggested, for with due respect to the "*third* great name, the wizard of the new telegraphic system," the gap between the Wheatstone tape system and the Murray Multiplex is by no means empty of other successful printing systems as Mr. Murray has himself most generously acknowledged. However, there must have been special jubilation in the *News* office that evening, and it is heartening indeed to read so enthusiastic a report on telegraphic matters in the lay press.

The C.T.O. was visited in January by a small delegation of Swiss and Italian business men headed by the Secretary of the Swiss Legation, who paid very special attention to the Anglo-foreign circuits and spent more than an hour in watching the working of the long-distance lines which fan out from the Cable Room. Like many other visitors they were surprised at the size of the building and "never guessed that in the midst of the City of London there existed so wonderful an organisation."

The experimental stage of Hughes' wireless trials between London and Berlin has been succeeded by two or three weeks' working with live traffic, several hundreds of public telegrams having been successfully and expeditiously dealt with for the first time by means of this printing system. At the time of writing an accident has happened to the antennæ at Zellendorf. There is no doubt in the writer's opinion, that the Hughes lends itself well to wireless transmission, owing to the practical absence of any lag due to long submarine or other metallic conductors. It cannot be said that the present London-Berlin wireless arrangements provide an ideal wireless circuit, nevertheless, with the watchful co-operation of Stonehaven and that of our expert friends of the C.W.O., added to which one may hope the exploitation of the circuit by the most expert Hughes manipulators at both ends, it could give much better outputs even than those yet produced. The more expeditious treatment of RQs was a distinct feature.

Listeners-in during the evening periods may have recognised an old C.T.O. colleague in the person of Mr. A. E. Thompson now engineer of the Western Electric Company. I rather fancy too—such is the faithfulness of modern high-speed printing—that A. E. T.'s photograph appeared in a recent issue of the *Broadcaster*. In any case, Mr. Thompson is to be congratulated upon his versatility, engineer in charge of broadcasting at Witton, or exponent of the merits of five-unit multiplex duplex in half-a-dozen countries it matters not.

A report from His British Majesty's Minister at Caracas, which has recently come to my knowledge, gives a very interesting record, amongst other things, of telegraphic progress in Venezuela in 1921. This though belated is nevertheless the latest report available. 1921 was a busy year for Venezuela. The telegraph system was extended *via* Nutrias and Bruzual to El Amparo on the Colombian frontier and five new stations were opened: at San Lorenzo,

Digitized by Google

Lagunillas, Santa Rita, Bruzual, and Palmarito. The total length of telegraph wire is 10,049 kilometres, with 218 stations. Radio stations now exist at Barquisimeto, 400 miles range; La Guaira, 400 miles range; Caracas, 300 miles range; Maracaibo, 300 miles range; Maracay, 300 miles range; Porlamar, 200 miles range; Puerto Cabello, 300 miles range; and San Cristobal, 400 miles range.

During the year a radio service with Trinidad (and thence by cable to Europe) was opened, the charge by the through rate to London being less than that charged by the French Cable Co.

A radio service has also been established between Venezuela and New York *via* San Martin.

The revenue from the telegraphs in 1916-17 was 468,257 bolivars. In 1919-20 it had increased to 1,010,364 and in 1920-21 had risen to 1,131,754, nevertheless, as the expenditure during the year just quoted was 2,330,122, there was a definite loss of £50,000 in round figures.

The following is quoted as an actual definition given by a Toronto daily paper some time ago, and may lighten the strain of the study-hours of this year's technical students. So far as can be gathered, the reporter was describing a Hydro Electric Power installation and he proceeded thus :—

> "There were six holes in a brick wall, through which entered, passing along copper wires encased in pipes, 26,000 units of power. They are called 'volts,' and volts means leaps or bounds. 'Leaps' of power; but the bounds are so speedy that practically the power pressure may be said to be unbroken in the direct current."

The *Electrical Review* states that a severe criticism is made by the *Radio Revue* of the French Government's regulations for the use of wireless aboard French mercantile ships and the selfish ignoring of their obligations by French shipowners and shipping companies. The French arrangements are declared to be ten years behind the progress of radio-telegraphy. The apparatus is said to be obsolete and inefficient. The most luxurious of French mail boats have to dispense with Press messages, even on voyages of two months' duration. These strictures, it is to be observed, do not apply to the French navy, which is said to be abreast in the matter of progress, with the navies of other countries.

According to the *Melbourne Age* the following are some of the conditions upon which Commonwealth wireless licences are issued, extreme care being taken to prevent the possession of secret sets. Installations must be operated by certificated operators, and with regard to land stations the regulations stipulate that unless specially authorised by the Minister, the licensed installation shall not be utilised for the conduct of commercial traffic constituting competition with the Postmaster-General's telegraph and telephone services. The regulations provide for licences for broadcasting stations used for the purpose of disseminating news or entertainments. These installations must also be operated by certificated operators, and a stipulation is made that the stations shall not be employed for broadcasting advertising matter or commercial traffic. Further regulations relating to the control of broadcasting installations will be issued later.

The fees for the various types of licence will be as follows :—Coast station, £1; ship station, £1; land station, £1; broadcasting station £5; experimental licence (transmitting and receiving), £1; experimental licence (receiving only), 10*s.*; portable station, £1; aircraft station, £1.

Reuter's Trade Service is responsible for the following very interesting paragraph on Carrier current Telephony Developments :—The American General Electric Co. has succeeded in transmitting the voice over electric power lines operating at 70,000 volts by means of a carrier current. The tests were made over the high-pressure transmission lines connecting the Highland town sub-station of the Pennsylvania Water and Power Co. at Baltimore, with its hydro-electric plant at Holtwood, on the Susquehanna River, a distance of 40 miles. Conversation was carried on under every possible possible condition that might occur on a power transmission line, such as short circuits, grounding, and broken wires. The voice is received in much the same way as radio broadcast signals. The equipment consists of a detector and two amplifier tubes. Tuning is not necessary, as the wave-length and other characteristics are always the same. Since carrier current travels on a wave-length of 15,000 metres, it is removed from any possibility of interference from radio broadcasting stations. The 50-watt sets, as tested, are capable of carrying on communications for a distance of 85 miles, but 250-watt sets are being made by the General Electric Co. which will make it possible to extend the distance of communication to 260 miles.

The retirement of Mr. Hutchinson (Plant Superintendent) of the C.T.O. removes a kindly and sympathetic personality from the ranks of C.T.O. superintendents, as all those who have had occasion to come into close contact with him will be ready to testify. There will be no more willing acquiescence in this tribute than that of those more specially connected with Cable Room technical matters for whom his ready co-operation did much to lubricate official wheels during the war, and post-war periods. The heartiest good wishes go with our colleague in his retreat by the side of the silver sea. May all the good things which he would wish himself and his household accompany him! It is also a happy chance that has placed Mr. Sanderson as his successor.

Amidst scenes and sounds almost if not quite unique in the annals of the C.T.O., Mr. Spalding, Assistant Superintendent, quitted the Provincial Gallery to pass out to his retirement one day in January last upon reaching the age-limit. Surely no man could leave the scene of forty odd years of activity unmoved with those hearty cheers ringing in his ears, and without feeling the sincerity of the sympathetic if full-throated ovation. Surely, too, the remembrance of this last day at the office will be set against the official *contretemps* and even those official disappointments against which most of us have bumped at one time or other. Thus, also surely, must our friend have soliloquised as he left us and no doubt has already placed these expressions of affection among life's compensations.

A subsequent reception and presentation at "The Ship" gave tangible evidence of the reality of the previous vocal signs in the shape of some beautiful mementos of the occasion. Mr. Edwards (Deputy Controller), at no small personal inconvenience, broke away from another gathering in order to "deliver the goods" to the recipient, which task was performed to the complete satisfaction of all present. The proceedings were accompanied by excellent instrumental and vocal items, and, but for one jarring note, were a complete success.

One of our longest submarine cables recently developed an earth fault at or near the cable hut on the foreign shore. Wishing to inform London that the fault had not been removed, the engineer-in-charge there directed a service message in the following unconventional but expressive terms :—"We inform you the place of corruption is not cleared."

Telegraphic communication between Italy and Albania has been re-opened by means of the Otranto-Vallona cable.

According to the *Ceskoslovenska Posta Telegraf a Telefon*, published by the Czecho-Slovakian Government at Praha, Engineer Steinbach has written an interesting article on Baudot telegraphy. Thus this, one of the youngest of the countries of New Europe, is apparently well in the van of progress.

It is understood by the *Electrical Review* that in well-informed circles in Berlin the directors of the German Atlantic Telegraph Co., of Cologne, are in promising negotiations with an American group in regard to the grant by the latter of a loan for the establishment of a direct cable to the United States. Foreign aid in this respect is necessary, as owing to the depreciation of the mark it would have been impossible to raise sufficient funds in Germany, and the compensation from the Reich for the loss of cables is also inadequate to accomplish the object in view. It is denied that the company has been transformed into a Portuguese company or has come under the influence of an American group or that its shares and debentures have been exchanged for similar holdings in foreign currency. The "German Atlantic," it is emphasised, is and will remain an independent German company.

Reuters' Agency states that further experiments are to be made by the French telegraph and telephone service in connexion with the transmission by wire or radio of photographs, drawings, finger-prints, and handwriting by the system invented by Dr. Belin, known as telestereography. It is hoped that the system may prove of particular use in communicating with Eastern countries, such as Japan and China, where it would be of advantage to transmit the native characters instead of having to translate them into a Western alphabet.

The following two items are also published on the same authority :—Commercial wireless communication between the United States and China has now been established. The Federal Telegraph Co. announced on Jan. 5 that a station at Hillsboro, Oregon, working on 8,400 metres, was being heard regularly at Shanghai, where the company had erected an experimental station.

An American company intends shortly to inaugurate a radio-telephone broadcasting service in Shanghai.

As a result of the installation of a new valve transmitter, the wireless station at Bergen (Norway) has repeatedly been in communication with American stations, whose signals have been distinctly heard. The Bergen station has also been equally successful in transmitting replies, the American stations reporting that the signals were very distinct.

According to the *Electrical Review* a radio-telephonic convention has been arranged between the German and the Swiss Governments whereby all the Swiss networks may now communicate with all the networks of Bavaria and Wurtemberg, also with those of the postal districts of Darmstadt, Frankfort-on-Main, Karlsruhe (Baden), and Constance. It is announced also that, by an agreement between the Governments of France and Switzerland, all the Swiss networks may now exchange messages with all the networks in the Department of the Upper Rhine. The tax for a non-urgent conversation within a distance of 30 kilometres is 1 fr.; above that distance, 2 fr.

The Times informs us that telegraphic communication has been established between the Kilo region of the Belgian Congo and the British telegraph system in Uganda.

Advice to Those in Charge.—If you ask for discipline or complain of the lack of it, ask yourself "Am I worth following"? Your assistants, your disciples, if I may call them so, will interpret you to the public. . . . . You will not make disciples by fair speeches and if you do not make disciples you will not have discipline. . . . Be prepared for things going wrong and when you are inclined to lose your temper over them analyse what temper is. It is mental sickness. Compare it with sea-sickness. Let humour come to your aid and show you how ridiculous temper is when it is of the fretful variety. . . . You claim to be the captain of your ship, act like a captain and not like a cabin-boy.—*Robert J. Norton, Address to the Yeovil Rotary Club.*

J. J. T.

PROGRESS OF THE TELEPHONE AND TELEGRAPH SYSTEM.

TELEPHONES.

THE total number of stations in use in the Post Office system on Dec. 31 last was 1,028,258, of which 369,038 were connected with London exchanges and 659,220 with provincial exchanges. The net gain during the month was 7,958, making the total net increase for the December quarter 22,485, the best result yet recorded. There are indications that the introduction of a lower tariff for residence lines has contributed to this result as 40 per cent. of the net growth in exchange installations in the quarter was in respect of private house connexions. At the end of December the total number of residence rate subscribers was 148,892, *i.e.*, 26 per cent. of the total subscribers.

The net addition to the number of Call Offices during December was 103, bringing the total at the end of the month to 16,196, and making the net increase for the year 1,154. The public call offices in street kiosks numbered 374, representing a growth of 50 per cent. during the year.

A substantial increase in Rural Party Line subscribers was reported in December, the total at the end of the month being 6,205. The number of subscribers to this service has more than doubled during the past 12 months.

The weekly returns of traffic shewed the usual seasonal decline in December and January, and there is as yet no indication of a marked improvement in the calling rate.

The trunk traffic continues to show a slight upward tendency, though the increase, as in the case of the local calls, is not as yet substantial. For the month of November, 1922, the increase in number of calls over the corresponding month of 1921 was 16 per cent.

A marked development in the continental traffic has taken place during recent months. For the 8 months ended November the receipts from outgoing calls amounted to £50,162, an increase of £13,195 (35 per cent.) over the corresponding period of 1921.

Some statistics shewing the general development of the service during the 9 months ended December are given in the appended table :—

TOTAL AT END OF :—

	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.
Exchanges ...	3,112	3,116	3,115	3,113	3,114	3,116	3,121	3,128	3,140
Exchange stations	942,071	947,534	953,931	957,476	962,852	969,126	974,959	983,528	991,049
Private wire stations	36,960	36,934	36,810	36,627	36,578	36,647	36,632	36,772	37,209
Call Offices (stations)	15,405	15,487	15,573	15,667	15,755	15,838	15,962	16,093	16,196
Call Offices in street kiosks	275	289	305	317	327	335	344	356	374
Rural Party line stations ...	3,747	4,101	4,408	4,671	4,894	5,191	5,579	5,936	6,205

Further progress has been made with the development of the local exchange system. Among the more important works recently completed are the provision of a new exchange at Lark Lane, Liverpool, and extensions of the East Ham (London), Nottingham, Macclesfield, and Wolverhampton Exchanges.

The main underground system has been extended by the completion and bringing into use of new cables as follows :—

Hawarden—Rhyl.
London—Guildford.
Waltham Cross—Epping—Bishops Stortford. and
Hull—Grimsby.

During the month of January, 25 new overhead trunk circuits were completed and brought into use, and 28 additional circuits were provided by means of spare wires in underground cables.

TELEGRAPHS.

During last month the following Baudot installations were brought into use, displacing Morse working between the offices concerned :—

(1) Liverpool—Leeds—Hull.

(2) Sheffield—Leeds—Grimsby.

The Birmingham—Cardiff Baudot service, which was opened in January, was also extended to Milford Haven.

LONDON ENGINEERING DISTRICT NOTES.

Presentation.

A VERY interesting little function took place at Denman Street on Jan. 31, when a presentation of a silver salver was made to Mr. Preston by Mr. McIlroy on behalf of those engineering officers who came into personal contact with Mr. Preston. Tribute was paid to the unvarying courtesy and kindliness which characterised Mr. Preston in all his dealings with the engineering officers, and the very excellent relations which exist at present between the staff of the London Telephone Service and that of the London Engineering District were attributed largely to the influence of the late Controller. It was stated that Mr. Preston had shown conclusively that in order to be efficient it was not necessary to be brusque and abrupt as was sometimes erroneously supposed, but that on the contrary the existence of courteous and harmonious relations tended to make the official machinery run smoothly. It is as true in human relationships as in lifeless machines that friction involves waste of energy, and an efficient organiser is one who is quick to notice the existence of friction and takes immediate steps to remove the cause.

The hope was expressed that, whether Mr. Preston found fresh work upon which to expend his boundless energy or whether he took a long period of leisure, his future years would be full of health and joy.

"Institution of P.O. Electrical Engineers."

In spite of the fog there was a very good attendance at the Institution of Electrical Engineers, Thames Embankment, on Wednesday, Jan. 17, at 5.30 p.m., to hear Mr. E. S. Ritter's paper on Cable Testing before the London Centre of the Institution of Post Office Electrical Engineers. In the absence of the Chairman of the Centre (Mr. R. McIlroy, Superintending Engineer of the London Engineering District) on official business, the Chair was taken by the Vice-Chairman, Mr. H. Wilson (Staff Engineer). Among the audience we noticed Mr. F. C. Baldwin, Assistant Superintending Engineer, N.E. District, and Chairman of the N.E. Centre of the parent Institution ; Mr. Frank Gill, President of the Institution of Electrical Engineers and European Engineer of the Western Electric Company, and Mr. E. S. Byng of the same Company.

The use of telephone repeaters, balanced cables and loading coils in connexion with underground plant necessitates a very accurate knowledge of the constants of the cables which are used, and the requirements as regards insulation, conductants, capacity, are much more exacting than they were at one time. The paper described in detail the methods adopted by the Department for testing cables during construction, and also dealt with the testing and localisation of faults in cables. In addition, a brief account of the principal operations involved in the laying, jointing, loading and terminating of main cables was given. Much of the work described in the paper is original, the methods and tests having been devised by officers of the Engineering Department, and it is gratifying to note that our American friends—generally regarded as being far in advance of engineers in this country in telephone practice—have adopted some of these methods.

Several debatable points were intentionally raised in the paper, for example, the waxing of cables opened for jointing or testing ; the terminating of cables and the merits of silk and cotton covered cable. These points, however, did not raise as much discussion as one would have liked. Mr. Ritter is to be congratulated upon his paper which forms a valuable contribution to our knowledge upon the important subject of cable testing. Its value for reference is enhanced by a summary of contents, an index, and a bibliography. It is to be hoped that the paper will be printed, and thus be available for general use.

PRESENTATION TO MR. KIDD.

MR. A. M. KIDD, who was for 17½ years District Manager of the Cork District, has been transferred to Nottingham as Acting District Manager, and was on the occasion of his farewell visit to the District Office presented with a Silver coffee pot by the staff.

"TALK OF MANY THINGS."

THE name of the first prize winner in the recent competition is Miss Blair, of Liverpool.

The London Telephonists' Society.

The meeting of the L.T.S. (held every month with great success) took place last time on Feb. the 2nd, when Competition Papers beckoned. Miss Bott (to hear her, what a boon!) "emerged" a Moth from its Cocoon. With insight and with humour, too, she gave the learners' point of view; and said how careful chiefs should be to show a ready sympathy.
